HOOD'S FOUNDRY COKE.

Consumers are respectfully informed that owing to inferior brands of Coke having been sold in this and other countries under the name of "Patent Coke," the Glamorgan Coal Co. (Limited), Cardiff, in May, 1884, abandoned the title of "Patent Foundry Coke," substituting that of "Hood's Foundry Coke."

This Coke is exclusively used by the Selby Smelting and Lead Co., Union Iron Works, Professor Thomas Price, and other consumers here. Large quantities are regularly forwarded to Copper Smelters in Arizona and New Mexico, and also to consumers in Nevada and Salt Lake.

The undersigned are the SOLE IMPORTERS of the above Coke, which is for sale in quantities to suit purchasers.

Of all kinds made to order. Send for Descriptive Catalogue. 17 and 19 Fremont St., San Francisco.

\$1,000 CHALLENGE!

**THE FRUE ORE CONCENTRATOR,
OR VANNING MACHINE.**

**PRICE: FIVE HUNDRED AND SEVENTY-FIVE DOLLARS,
(\$575 00), F. O. B.**

OVER 1,000 ARE NOW IN USE. Saves from 40 to 100 per cent more than any other Concentrator. Concentrations are clean from the first working. The wear and tear are merely nominal. A machine can be seen in working order and ready to make tests at the Fulton Iron Works, No. 220 Fremont Street, San Francisco. As the result of a suit East against an End-Shake Machine (the Embrey), similar to the Triumph, the Frue Vanning Machine Company owns the Embrey patent, and can put in the market an End-Shake Machine of earlier patent that will do as good work as the Triumph, and superior in construction and durability. There will be no risk of suit for infringement. The Frue Vanning Machine Company warn the public that they claim and will prove the Triumph machine to be an infringement on patents owned by them. Protected by patents May 4, 1869, Dec. 22 1874, Sept. 2, 1879, April 27, 1880, March 22, 1881, Feb. 20, 1883, Sept. 18, 1883. Patents applied for. N. B.—We are and have been ready at any time to make a competitive trial against the Triumph, or any other Concentrator for stakes of \$1,000.

Triumph Ore Concentrators.

Our attention has been directed to a circular recently issued by the Joshua Hendy Machine Works of Nos. 39 to 51 Fremont street, this city, giving a full description of the above form of concentrators, with directions for setting up and operating them, and we note that several important improvements have been introduced into their construction which must necessarily greatly increase their durability and efficiency. Notably among these improvements is a stiffening of the frame by heavier cross-pieces near the head of the machine, and placed directly under the main crank or eccentric shaft with dripping receptacles on each end for the catchment of any oil escaping from the main shaft boxes.

The main crank shaft has been made heavier being now two inches in diameter, which tends to impart greater steadiness of motion to the shaking frame and its increased size gives, of course, increased durability to the shaft itself.

By the introduction of this cross-piece and certain changes in the shaft, its bearings are brought together on the one independent piece by which their true position in line is secured under all conditions of change.

The riddle table which was formerly bolted to the feed and amalgam bowl has been discarded, and a riddle and distributing table of wood substituted, which is supported upon standards which are bolted to the shaking frame in front of the bowl and set with a slight pitch from the bowl towards the surface of the endless traveling belt. This change is an important improvement, as it will readily be observed that the motion of the table is now reciprocal with the longitudinal movement of the shaking frame and belt. The form of the upper portion of the pulp and amalgam bowl has been altered, by which the pulp is distributed not only at the center, as formerly, but at both ends as well, whereby a better distribution of the pulp is had in the bowl and a more perfect separation of the metallic particles, amalgam and quicksilver, effected by the action of the stirrers or fingers fixed on the shaft running through the bowl, and these pulp entrances being located back of the stirrer shaft it is kept clear of pulp and all splashing is prevented. Several other improvements of perhaps minor value have been devised, which now make this concentrator complete in efficiency of its operation and durability.

Profitable Lead Mining.

Some of the English companies which are mining on this coast have done very well, though many of them have paid exorbitant prices for their properties. As to profitable mines, a case in point is that of the Richmond Consolidated, of Eureka, Nevada. The capital of the company is £270,000, or 54,000 shares of £5 each. The total dividends paid aggregate £808,517. The profit last year was £35,667 against £30,146 the previous year. Out of this sum of £35,667 3s. 6d. and the sum of £17,093 13s. 5d. brought forward from last year's account the directors have paid dividends during the year amounting to £13,500 and £8,337 17s. 4d. for expenses of defending mine, law costs,

ing, purchased ore, renewals and repairs and all other working and general expenses at Eureka being £126,506 1s. 10d., the profit for the year on mining, smelting and refining is, with £97 1s. 2d. received for sundries, £43,158 13s. 6d. The ore smelted this year has been of about the same quality as last year, the average being \$57.32 as against \$56.01 last year, and the yield per ton of ore has been this year \$51.77 as against \$52 13. The expenses of mining have been reduced from \$15.83 to \$11.75 per ton of ore; this is principally on account of the small quantity of deadwork done. The smelting expenses per ton have also been reduced from \$11.72 to \$10.39. The amount paid for purchased ore has again been very large—£48,181 for 8940 tons as compared with £48,357

Deep Mining for Gold.

Although gold mining in Victoria, N. S. W., is an industry which is comparatively depressed just now, there are some features which are not only encouraging there, but also to gold miners in other parts of the world. The Mining Registrar for the central division of the Ballarat district, reports the Band of Hope and Albion Consols Company, on the Redan line of reef, struck a solid body of stone two feet six inches in thickness in a cross-cut at a depth of 1000 feet, the greatest depth yet attained on that reef. "This opportune discovery of payable quartz at the deeper levels," writes the Mining Registrar, "cannot fail to give a great impetus to mining operations in this district and to this line in particular."

They believe in deep mining for gold in that region as may be seen from the following list of the ten deepest shafts in Victoria—(1) Magdala Company, at Stawell, 2409 feet; (2) Lancel's 180 mine, Sandhurst, 2041 feet; (3) Victoria and Pandora Company, Sandhurst, 2000 feet; (4) Newington Company, Pleasant Creek, 1940 feet; (5) Prince Patrick Company, Pleasant

Creek, 1830 feet; (6) Crown Cross United Company, Pleasant Creek, 1815 feet; (7) Prince Alfred Company, Pleasant Creek, 1770 feet; (8) North Old Chum Company, Sandhurst, 1684 feet; (9) Oriental Company, Pleasant Creek, 1676 feet; (10) New Chum and Victoria Company, Sandhurst, 1625 feet. Only two of these shafts were deepened during the quarter, viz., that of the Victory and Pandora Company by 60 feet, and that of the North Old Chum Company by 20 feet.

The mining population of the colony is estimated by the Mining Registrars at 27,632. In quartz mining 12,409 miners are engaged, and 15,223 in alluvial mining. Of the total mining population 5258 are Chinese. The value of the machinery employed in the gold fields is £1,879,316. The Registrars' reports show that in many localities mining suffered during the quarter through want of sufficient water for sluicing and crushing purposes. The total quantity of gold raised during the three months ended 31st March was 192,438 ozs. 11 dwts. 15 grs., and its value, at £4 per oz., is £769,754 6s. 6d. The area of auriferous ground actually worked upon is returned as 315 square miles, being about $\frac{1}{4}$ square miles in excess of the area worked upon during the previous quarter.

IMPROVED TRIUMPH ORE CONCENTRATOR, SHOWING NEW RIFFLE TABLE.

etc., they have also written off £3,931 14s. 3d., the balance of outlay on Williamsburg mine, leaving a balance to the credit of revenue of £26,971 5s. 4d. to be carried forward to next year.

From the report of the directors, just issued, it is seen that during the past year 6297 tons of Richmond ore and 6523 tons of purchased ore have been smelted by the general furnace, and 840 of low grade Richmond and 2416 tons of purchased ore have been smelted by the No. 4 furnace, working in connection with the refinery. The production for the year, including the returns from the speiss, is 18,811 ozs. of gold, 495,909 ozs. of silver, and 2130 tons of lead. The amount received during the year on sales of gold, silver and lead is £187,414 16s. 9d. and the estimated net value of the bullion in transit and at the works unrealized, after allowing for all unpaid refining and marketing expenses, is £137,209 19s., together £324,624 16s. 9d., from which deducting the value of the bullion in hand on February 29, 1884—£135,249 11s. 5d. and £19,807 10s. 2d. paid for marketing expenses, refining, freights, commission, brokerage, etc.—leaves £169,567 14s. 2d. as the net value of the bullion produced in the year. The cost of mining, deadwork, smelt-

ing, purchased ore, renewals and repairs and all other working and general expenses at Eureka being £126,506 1s. 10d., the profit for the year on mining, smelting and refining is, with £97 1s. 2d. received for sundries, £43,158 13s. 6d. The ore smelted this year has been of about the same quality as last year, the average being \$57.32 as against \$56.01 last year, and the yield per ton of ore has been this year \$51.77 as against \$52 13. The expenses of mining have been reduced from \$15.83 to \$11.75 per ton of ore; this is principally on account of the small quantity of deadwork done. The smelting expenses per ton have also been reduced from \$11.72 to \$10.39. The amount paid for purchased ore has again been very large—£48,181 for 8940 tons as compared with £48,357

for 9762 tons last year. The exploratory work done in the mine during the year has been very small, consisting of only 279 ft. of drifts. The cost of this deadwork (£484 3s. 7d.) has been included in the working expenses of mining. These explorations have been attended with very good results. Several small bodies of good ore have been developed on the 300 and 400 levels, about 2000 tons of ore being already exposed, and there is every probability of these small bodies connecting and further developing. Explorations will now be vigorously carried on.

It is stated that the first clean-up of the 120-stamp gold quartz mill at Douglas Island, Alaska, in a run of only 23 days, yielded 1200 pounds of amalgam, valued at between \$90,000 and \$100,000. This is exclusive of sulphurets, which are said to be not only very rich, but to average six per cent of the ore. At this rate, it is estimated that a full month's run, including sulphurets, will yield at least \$170,000.

Mr. THOMAS SEALE, who has been superintendent of the California Street Cable road, since its inception, having resigned his position, has been presented by the employees with a fine gold watch and chain.

CORRESPONDENCE.

We admit, unendorsed, opinions of correspondents.—Eos.

The Russell Leaching Process.

EDITORS PRESS:—Touching the above-named process, as described by Mr. Stetefeldt in his article on treatment of dry and base silver ores, I have a couple of remarks to make which I hope will not be misconstrued, as I have no wish to disparage either Mr. Russell or his process.

The fact that lead can be precipitated from its solution in a hyposulphite by sodium carbonate, leaving silver still dissolved, was known, if not before Mr. Russell's discovery, at least before any public announcement of it. In the spring of 1882, Mr. G. F. Beardsley made the direct experiment at my request, and I have made no secret of the fact. In the same year I mentioned the circumstances to the then superintendent of the Silver King mine, in connection with the leaching of his ore, but for good reasons it was not considered desirable to apply the method.

In regard to the action of a copper salt in conjunction with a hyposulphite, I tried it and many other things, 15 years ago, when engaged on my methods of amalgamating ores without roasting. I did not observe that the compound had any special effect, or that it was in any degree a substitute for the copper chlorides in leaching or amalgamation of unroasted ores, which, however, proves nothing as to roasted ores. I found that warm, strong sodium hypo solution could extract 80 per cent or more, by leaching, from the partzite ores of Blind Springs.

Granting that the compound is useful, which I cannot doubt since Mr. Stetefeldt says it is, I would inquire, for information, whether the copper salts which are usually, or frequently, present in roasted ores, as dichloride, etc., and which are not removed in the washing but dissolve in the leaching, are not as good as the added bluestone of Mr. Russell's "extra solution."

While on this subject I will mention a circumstance which I have not thought of sufficient importance to justify a special communication. Some time ago Mr. Stetefeldt, in one of his communications, gave Mr. Russell credit for having discovered that the ordinary so-called "chlorination assay" does not correctly indicate the percentage of silver chloride in roasted ore. Now this fact had been published long before in your paper, for proof of which I refer to the account of my investigations in the MINING AND SCIENTIFIC PRESS, some time during the summer of 1876, and which was reproduced in my book, "Leaching Gold and Silver Ores" in 1881, which was previous to Mr. Stetefeldt's announcement of Mr. Russell's discovery, and which hook the former gentleman possessed or had seen.

Mr. Stetefeldt proposed that the assay should be called a "lixivation assay," ignoring, or forgetting, that I had already given it the equally appropriate name of "solubility assay." (See page 93 of the book.)

I mention this in illustration of an apparent tendency among Eastern scientific and professional men to ignore or belittle the work of Western men, and, perhaps, especially of those who have not thought it worth while to append *tails to their names*. However, in the now somewhat monotonous singing of Mr. Russell's praises by Mr. Stetefeldt, it is quite conceivable that Mr. Stetefeldt may have an object very distinct from that of disparaging others, and, as I am not in the habit of mining matters, I will say plainly that I suppose him to be interested in Mr. Russell's patents, in which case he is quite right, from a certain point of view, a point of view, however, from which many gentlemen would prefer to be unobserved, if not distinctly invisible.

I will take this opportunity to mention a few facts which I have "discovered," though it is quite likely that others may have preceded me, there will at least be no necessity for yet others to follow.

Both copper and silver are readily precipitated from solutions of their salts in solution of sodium hyposulphite, by metallic iron. Knowing this as to the silver I made the experiment of amalgamating roasted ore in an iron mortar with addition of sodium hyposulphite. The result was, I got no amalgam, but the interior of the mortar received an adherent coat of a pink color, consisting of silver and copper which would not amalgamate, and which I had to remove by means of acid.

Nickel is precipitated by copper and by iron from the hyposulphite solution. The coat is adherent, but may be scaled off from the copper by bending and beating that. The peculiarity about the deposit is, that although not apparently metallic, it is not attracted by the magnet. I think it contains sulphur, but have not verified the idea.

Nickel and cobalt are completely precipitated by zinc from ammoniacal solutions, in the form of black magnetic powders, which I believe to be the pure metals. With a single couple, of zinc and platinum; the latter in the solution of nickel or cobalt, precipitation proceeds rapidly, nickel being deposited as a slightly coherent and adherent sheet on the platinum. An assay

or a metallurgical process can be made of this, but it will not separate the two metals, the one from the other.

Recurring to Russell's process, one of the difficulties in the treatment of the Silver King ore by the leaching process was the adherence of the ore to the walls of the rotatory furnaces, forming a crust of constantly increasing thickness, and this trouble increased as the ore treated was more heavily charged with zinc-blende, to which, and to galena, the trouble was due, owing to the formation of zinc and lead chlorides. If that ore could be leached by Russell's process, after a roasting without salt, a great advantage would be gained. When the ore became so bad that it could not be roasted in the ordinary way, without balling, I roasted without salt up to a certain stage, and then chloridized by an addition of calcined copperas and only two per cent of salt, the usual proportion which was found necessary when added earlier being ten per cent. The result was that the incrustation of the furnaces was very much lessened, the roasting was more rapid, the tendency to balling was entirely obviated and, though "solubility" was high, the leaching was tedious mechanically, owing to the dusty condition of the ore. With coarser crushing and something like Nevins' two cylinder roasting furnace for oxidizing and chloridizing separately, the work might have been continued longer than it was. The leaching vats should also have suction pipes, which I would recommend in most cases, and especially in case of leaching ores, roasted without salt, by Russell's process. Laboratory experience proves that leaching (or filtering) under pressure is far more effective as well as more rapid than without pressure.

At the Mount Cory works, Mr. Arents has a new (to me at least) style of leaching vat which is very easily and cheaply discharged, and is worth the attention of those who have to put up leaching plants. C. H. A.

MILLING AT THE NAVAJO MINE.—From the annual report of Superintendent W. C. Price, of the Navajo mine, we take the following concerning the milling operations: The mill run covers a period of 1874 days, of which the actual running time of the engine was 1763½, showing a loss of 10½, including all stoppages of every nature incidental to a mill run, of which six days of this was for the erection of a new furnace. The running time of the battery was 175½ days, and made an average crushing of 13 3-5 tons per diem. During this time there was milled 2,392 13 20 tons of ore, of which 37 3 20 tons was custom ore. The average battery pulp assay of the ore from the mine was \$158.90 per ton, and was worked to 90 95-100 per cent of the battery assay. Custom ore averaged \$161.25 per ton, and was worked to 85 per cent. Shipped bullion on customers' account to the amount of \$2,118.41. On company account, to the Bank of California (from Navajo ore), \$340,510.49; from custom ore and clean-up, \$10,278.99, making a total production in bullion of \$350,789.43 (assay value), or less discounts, express charges, hullion tax and reclamations, \$284,044.43 (coin value) during the fiscal year. The mill workings for the past year show no material difference from the usual excellent results that have been attained in previous years. The lower furnace gave out in December, having been in use the past seven years and was replaced with a new one. Milling operations were suspended on February 3d, as the reduction of wages was not acceded to by the employees. Explorations were then at once resumed in the mine, the suspension of which had been necessitated by the milling operations, which required almost the full capacity of the hoist.

ENCOURAGING PROSPECT.—If the Blue Jacket people make the success which their present appearances indicate, it will give an impetus to mining operations in that section and create such a boom as has rarely been experienced in the State. There are within a radius of a few miles of the Blue Jacket, almost innumerable ledges of the same character of ore, which if it can be successfully worked will furnish material for hundreds of stamps for many years to come. It is claimed that Mr. Milford, the superintendent, by a very simple chemical combination, has overcome the difficulties heretofore experienced in working the ore, and that too without the expensive process of roasting. If this is the case, there is nothing to prevent that section becoming one of the most prominent and productive districts on the coast. There is an abundance of fair grade ore, plenty of water and fuel, and all other facilities for mining and milling as complete as could be desired. It would not be at all astonishing from the present outlook, if in less than two years the most populous and flourishing mining town in the State would spring up in the mountains in which the Blue Jacket is located.

OIL IN WASHINGTON TERRITORY.—J. N. Gale, of this city, was down to Puyallup this week, and states that quite an excitement was created at the oil wells on Tuesday by new and promising developments. While they were engaged in excavating or clearing away the debris from the surface, preparatory to boring, oil, accompanied by gas, was seen oozing from a crevice in the rock which was uncovered. W. H. Kneeland, the superintendent, stated that the prospects are equal to any he ever saw in Pennsylvania, and he firmly believes he will strike a flowing well.—*Olympia Transcript*.

The Cassel Gold Extraction Process.

The great importance of treating our refractory gold ores and the concentrates saved from the ordinary appliances in use at the principal gold mines in all parts of this world, received a practical demonstration last week at the works of the company in Verulam street, Gray's Inn road, London, E. C. Mr. Cassel's process for the extraction of gold, which has been exhibited at the Inventions Exhibition, has received the attention of many scientific and practical authorities interested in making the best of our auriferous resource, and profitably maintaining a supply of gold so essential for the general prosperity of nations as well as for individuals. At the request of a number of scientists and others, the directors of the Cassel Gold Extraction Company gave a practical demonstration of Mr. Cassel's invention recently.

The necessity for an increasing and continuous supply of gold has now become so thoroughly recognized for the requirements of finance, trade, commerce and industries, and the necessities of every-day life, that those who devote their energies to a practical method of permanently increasing its supply become general benefactors. Several tons of antimonial gold concentrates were treated that had been obtained from Mr. Andrew McIlwraith's mines, in Queensland. This gentleman, who was present, is a relative of Sir Thomas McIlwraith, Premier of that colony. According to the assay of Messrs. Johnson, Matthey & Co., it showed that by the Cassel process 91 per cent of the gold was extracted. The process is purely one of chlorination. Common salt solution, or sea-water, and lime are the only substances used. Instead of the free gas being separately generated in the ordinary and costly way, the chlorine is evolved in the apparatus in the nascent state in contact with the ores, in which condition it has an immensely greater combining capacity for gold. At the same time nascent oxygen is also generated, which, oxidizing the sulphides, arsenides, etc., liberates the gold, the nascent chlorine at once converting it into a terchloride.

A secondary reaction here takes place, and hydrochlorous acid is formed, which oxidizes the pyrites; hydrochloric acid is also formed, which attacks any iron present, and forming a protosalt of that metal, this soluble iron compound precipitates the gold as fast as the chlorine brings it into solution, and thus prevents its extraction. Mr. Cassel, recognizing, after many experiments, the complicated nature of the above reaction, which so puzzled his predecessors, and being the first to point it out, has at length devised means whereby the iron compounds, which are invariably present in refractory ores, are retained in their insoluble form while under treatment, and thus are prevented from exercising any influence upon the solution of gold. This he accomplishes by the addition of caustic lime to the mixture of crushed ore and salt, which earth, by reason of its alkaline properties, at once combines with any hydrochloric acid, as fast as the latter is formed, and completely neutralizes it, so that no iron can be taken up. At the same time a hypochlorite of lime is formed, which again being decomposed by the action of the water present, affords additional nascent chlorine for the gold; the ultimate products of the reaction being chloride of sodium in excess, chloride of calcium, tri-chloride of gold, and undecomposed gangue at the anode, and chloride of sodium and sodium hydrate at the cathode.

Various forms of apparatus were shown and explained by the inventor and by Dr. Atcherly and Dr. Liepman, who assisted in conducting the operations; the apparatus most approved of, and giving the most satisfactory results, looks very much like the well-known Frieberg or amalgamating barrel. It consists of a large drum, inside of which are arranged a number of carbon rods; these rods form the anode or positive poles, and are metallically connected with the corresponding pole of a dynamo, while the other pole of the dynamo is connected with the hollow iron shaft of the drum, which serves both as axis to the drum and also as negative pole of the apparatus. This shaft terminates through stuffing-boxes in hollow standards or tanks, where finally the gold accumulates. The drum is charged with the ores and salt water added thereto, and then set in motion by suitable gearing at a speed of about eight revolutions per minute. The current is then passed through it decomposing the salt water, and nascent chlorine and oxygen are evolved at the anode. By the revolution of the drum the ores are constantly brought in contact with the carbons, where both these elements are generated, and the metals are readily dissolved. The adding of the lime neutralizes the acid as soon as formed, and thus prevents the formation of iron salts, and precipitates those already formed. Into the hollow shaft are bored a number of holes, and the shaft itself is covered with asbestos, which, while preventing the gangue from entering the shaft, allows the liquefied gold to penetrate through the cloth. After the addition of lime, which precipitates all other metals present except gold the latter metal is rapidly dissolved and deposited by the electrical action in the interior of the pipe in a finely divided metallic state and is carried from thence into the hollow standards by means of an archimedean screw

fixed in the pipe. These standards are provided with movable doors, from which the gold slime is from time to time taken, dried off, and smelted. The whole of the operations displaying the value of the Cassel process for saving gold was watched with much intelligent interest by all those who had the pleasure of being present, and the inventor and his assistants, Dr. Rowland Atcherly and Dr. Liepman, were highly complimented upon the results obtained and the success achieved.—*London Mining Journal*.

Sweetwater.

A little over three years ago, says the *Bodie Miner*, the first stir was made in the Sweetwater mines, in what is now known as the Patterson mining district. Discoveries and developments there created no essential mining boom; but practical mining men, seeing that it was a mineral paying region, proceeded to develop and work some of the properties for what they might be worth. A small mill was erected, and shipments of bullion in limited quantities have been comparatively regular ever since. But mineral enough is not yet being produced to make of Clinton a prosperous mining town. A serious drawback to the prosperity of Sweetwater in its infancy was a doubt thrown over the titles to property there. Nothing will keep capital out of mining regions more surely than will a conflict of titles to the property which capital would seek to develop. At Sweetwater the entire surface of the country is volcanic and mineral in its indications. Seven separate and distinct canyons converge there, in each one of which good prospects abound. And when the present stagnation in mining activity everywhere shall have recuperated there is no reason in the world why Sweetwater should not come in for its fair share of prosperity. The present population of Patterson mining district numbers about 100, probably one-half of whom are miners and prospectors, and the other half composed of millmen, wood dealers, packers, and business people of Clinton. That town now contains two stores, two hotels, two saloons, livery stable, blacksmith shop, barber shop, butcher shop, recorder and justice offices, a town hall, schoolhouse, twenty-five or more dwellings, and location of the Summers Con. mill and the buildings necessary to carry on all departments of a mining and milling business. The mines of this company are being actively developed, and operations at present are exclusively directed to opening the north ore chute or chimney. This portion of their mining ground has been reached by extending the deepest, or No. 2 Tunnel, from the workings of the old ore body northerly into the mountain about 600 feet, making the entire length of the tunnel over 1100 feet, and cuts this ore bearing section 700 feet deep on incline of vein. All ground above is entirely unprospected, except some light work.

Since the 18th of June this tunnel has been passing through ore varying from 18 inches to 3 feet in thickness, and assaying from \$15 to \$80 a ton, average samples. Some delay has occurred from lack of ventilation, but this want has been supplied by a blower driven by horse power. The supply of air is still limited, but sufficient to continue prospect work. From six to ten miners are employed. The mill is now supplied with tailings, employing from six to eight men, working 25 tons per day; and working ores from the mine at such other times as is sufficient to keep the stamps running.

Some prospecting work is being done upon the Great Western and Star mining claims, and some good milling ore is being sacked to ship. Six to eight men are at work in this canyon.

One tunnel is being run in Silverado canyon, by Mr. Gullikson of Antelope, with good prospects. Milling ore is being taken from this tunnel, which is now just cleverly in.

A tunnel is being run on the Jenny mine, and though scarcely below the surface some good ore is being discovered.

A shaft being sunk to develop the Ryan, on Patterson mountain, has attained a depth of 50 feet, but not yet cut the vein. Rich float, containing a large percentage of gold, is found in this vicinity.

Most active prospect work is being pushed on a number of mining claims along the easterly base and southerly end of this mineral belt, known as the "Frying Pan mines." The surface at this point, for two miles in length by two thousand feet in width, is strewn with heavy boulders of rich float. The deep, overlying debris causing this fissure has been a great drawback to the rapid prospecting of those claims. But a dozen or more determined prospectors, backed by some Mono county mining men, are making a vigorous effort to gain a solid formation in depth and find the source from which so much ore has been detached. And it will only be from want of facilities and supplies if, before another winter, a mine of great magnitude and wealth is not uncovered in this locality.

The Eclipse mill will soon be ready to work ores from the Frying Pan mines and other claims in which the owners are interested.

A PROFITABLE MINE.—The *Sentinel* says up to the present time the total amount of the assessments levied by the Eureka Con. Company is \$350,000. The total amount disbursed in dividends aggregates nearly \$5,000,000.

MECHANICAL PROGRESS.

Influence of Mechanical Invention.

In a recent issue of *Bradstreet's* the subject of "Progress in Manufacturing" is touched upon, and it is shown by reference to researches of Mr. Edward Atkinson to what extent the world is indebted to mechanical invention for the great abundance of useful commodities. The result is shown in a clear manner by the aid of charts. For the purpose of illustrating his argument or theory, Mr. Atkinson selected, among other industries, the manufacture of cotton sheetings, comparing the prices and other figures of 1840 with those of 1883 and 1885. The data were obtained from two mills which have always been successful.

In 1840 the product of cotton sheetings per hand per year was 9600 yards, while in 1883 it was 28,032 yards, an absolute increase of 190 per cent to efficiency of labor growing out of improvements in machinery.

In 1840 the number of spindles was 12,500; in 1883 it has increased to 30,500, an increase of 146 per cent.

The value of product per hand in 1840 was \$868; in 1883 it was \$1973, an increase of 127 per cent.

The rate of wages per hour in 1840 was 4.49 cents. In 1883 it was 8.80 cents, an increase of 96 per cent.

The rate of wages per year was \$175 in 1840, and in 1883, \$287, an increase of 64 per cent.

The number of operatives in 1840 and in 1883, remained about the same, while the increase in machinery was about 186 per cent.

The hours of labor were 13 in 1840 and 11 in 1883, being a reduction of about 15 per cent. In 1840 the price of cloth was about 9 cents, while in 1883 it had been reduced to about 7 cents, being a reduction of about 22 per cent.

Mr. Atkinson has summarized the progress thus: "Fifty years ago the average earnings of all the operatives in a large cotton mill, who worked thirteen hours or more a day, and among whom were comprised a much larger proportion of men than at the present time, while the women were older and there were fewer children, were \$2.50 and \$2.62 per week. The quantity of machinery which each hand could tend was much less; the production of each spindle and loom was less; the cost in money of the mills per spindle or loom was much greater, while the price of cloth was at times more than double the price at which it can now be sold with a reasonable profit. The average earnings of all the female operatives in what purports to be the same factory at the present time, on the same fabric, working ten or eleven hours a day, are \$5 per week, and in some cases even \$6 or more to the most skillful. That is to say, women now earn about twice as much in ten hours as men and women combined averaged in thirteen hours then. The course of events has been as follows: A continuous reduction in the hours of labor, coupled with an increase in the earnings per hour; a diminution in the ratio of capital to production, coupled with an increase in its productive efficiency; a constant increase in the supply of cotton fabrics per capita, coupled with a decrease in the price; a continuous increase in the purchasing power of gold dollars in respect to almost all articles of necessary subsistence."

It is pointed out that these facts afford a complete demonstration of the fallacy that high wages and high cost of production are synonymous; that the rate of wages is only one of many elements, instead of the single important element in determining the cost of production in any industry; that it is quite possible that the highly paid labor in our best cotton mills costs less per pound or yard of product than the "pauper labor" in the English mills, and that if the obstacle of obstructive tariff taxes on sundry things which they have to use were cleared away, American manufacturers would be more than able to hold their own.

TESTING STEAM BOILERS.—When a boiler has undergone repairs it is a usual and a very necessary practice to test it, not only to show the quality of the repairs, but also to find any other defects or weak parts which may have escaped notice. To test a boiler in such a case means to fill it with water and to apply pressure, "somehow," as it is often said, and, as the feed connections are often severed at these times, it of course means something else than the engine pump being used. To send to a boiler shop for a test pump is in many cases considered too expensive, and the practice of filling the boiler with cold water, touching up any leaks, and then opening the junction-valve from the next boiler and applying pressure by turning steam upon the top of the water, is consequently adopted. A severer test for repairs can scarcely be imagined, the strains produced being considerably greater than under any possible working condition, and the repair work due to testing is frequently longer in hand than that before testing.

TEMPERING DRILLS.—A correspondent of the *Blacksmith* tells that journal how he tempers drills, as follows: "I learned it from experience, and think there is no better plan. I dress the drill to the desired shape, then heat to a cherry red and insert it gently in a cup of warm water, which should be placed on the forge for convenience. I then take it out, and when the temper runs down to a dark straw color dip it into a can of common lard or grease,

such as we use in cutting threads, and cool it off above the cutting edge. This rule is good for chisels, punches and all kinds of small tools. I have tempered drills in this way that would drill through 1½-inch wrought-iron. I think they are less liable to heat than those tempered in water alone."

STEEL CANAL BOATS.—It is believed, says the *Age of Steel*, that steel canal boats are practicable and may be made profitable if, say for example, a steel steamer is run with two steel coustors. Steel is said to be free from objections, as compared with iron. Some plates of steel have just been tested in Pittsburg, which were made for a new steamer for the Detroit & Cleveland Steam Navigation Company. In other tests made by the Detroit Dry Dock Company a ball of iron weighing 950 pounds was dropped from a height of 35 feet on a plate 3-16 of an inch thick. The blow made a bulge in the plate that extended 20 inches into the ground, but the plate was not broken. The plate was then turned over and the ball dropped on the bulge. This was repeated five times, and then the plate was not broken, but when the ball was dropped on an iron plate one half inch thick the plate was broken at the first blow. These tests show plainly that thin steel plates are not only sufficiently strong, but that their elasticity would make them far superior to wood for building even the roughest barge.

STEEL NAIL CUTLERY.—One of the working force of *The Age of Steel* has been testing the malleability of the steel nails in market and finds that they can be readily drawn out cold into knife blades of the regulation table pattern; this without crack or flaw. It is an excellent test of the quality of the metal. That journal says that since the publication of the article a very decided interest in the subject has been manifested in many quarters, and has led to a number of other similar experiments. One of these was made from a boat nail eight inches in length, manufactured by the Riverside Iron Works, Wheeling, W. Va. The knife when completed was twelve inches in length, showing the malleability of the metal to be unusually great. The blade, when polished, resembled in shape and appearance the best quality of American carving knives. The Riverside Iron Company were the first in the country to erect their own plant for the manufacture of steel nail plate.

PRINCIPLES OF ADJUSTING BEARINGS FOR LINE SHAFTING.—The practice of high speed in shafts, and the entire substitution of belting for gear wheels, has called for some improved method of arranging the bearings of line shafts. The conditions required in such bearings are as follows: 1. The bearings should be long enough so that the pressure will never exceed 50 pounds per square inch of bearing area, and the material should be able to withstand a surface speed of 250 feet per minute, without wearing or heating. 2. The bearings should be adjustable in some manner so as to adjust themselves to the line of the shaft, and thus receive an equal pressure over the surface, to accommodate the unavoidable deflection caused by the strain and weight of the pulleys. 3. The bearings should be arranged with adjustment in two planes, so that the shaft may at any time be set in line without trouble or expense.

RAZOR BLADES are forged from cast steel. They are ground and scorched to take off the black scale, being heated in a coke or charcoal fire and dipped obliquely into water. After being drilled and stamped they are hardened and tempered. In tempering they are laid on their backs on a clear fire and are removed as their edges attain a pale straw color. Shavings of leather added to the fire prevent cracking when the blades are put into water. After tempering they are ground successively on stone, a lap charged with fine emery, and a second lap with finer emery. The final polish is given on a soft leather wheel charged with crocus, both razor and wheel being heated. It is then honed, working from the point to the heel, being laid flat for the purpose. Wire edges are rubbed off on a horn.

WEIGHTING A WOODEN FLY-WHEEL.—A California correspondent of the *Blacksmith and Wheelwright* says: Some time ago I saw in a mechanical paper the statement that a wooden fly-wheel could not be so evenly weighted as to work satisfactorily. But it can be done by boxing holes from the rim toward the center at regular distances, say every three inches around the circumference, and pouring in lead. Afterwards the holes must be plugged. If the speed be high, a rivet must be put through the wheel to hold each plug.

A PRIZE OFFER.—The Berlin society for the advancement of manufacture has offered a prize of fifteen hundred marks for the best essay on the progress, present position, and capability of application, or the photo-mechanic process for the reproduction of drawings, wood-cuts, copper-plates, oil paintings, and photographic representations of nature, with a comparative review of its results.

AMERICAN WHEELS IN ENGLAND.—The recent demand for English haussom cabs has disclosed the significant fact that the wheels imported there are of American make. Buyers here have therefore actually paid the cost of freight to and from London, and duty on their re-importation of these articles manufactured in their own country.

SCIENTIFIC PROGRESS.

Genesis.

The beginning or genesis of material is always a subject of more than ordinary interest for consideration when its progress brings it within the reach of our discriminating faculties.

There appears to be a natural instinct of the human mind which demands causes for the conditions which it beholds, and we also unconsciously seek to trace backward in one line toward the beginning or initial point, and forward in the other toward the consequences and probabilities of the future and the possible. It is therefore not strange that man should attempt to trace the history of the foundation and structure of the earth's surface from the fragmentary indications which have been here and there revealed at various points in its career. We have already stated our belief that the harmonious work, which is indicated everywhere in the domain of nature, shows that the creative forces which produce the results we now behold are constantly in active operation, and that the formation of mineral and its deposition in veins is going on constantly.

Basing our premises upon the acknowledged activity of the forces everywhere present, and upon the economical utility which allows no particle of matter to remain idle or uselessly inert, it is safe to state that all of the results of what we may term destruction, are rapidly forming new combinations and entering into new structures in most cases likely to be in harmony with the original position which they once occupied, than otherwise.

The constructive history of the slate and sandstone, as well as every other character of rock, indicate to a certainty that the immense burden of material which the waters of our thousands of rivers annually carry, from mountain side and valley out into the ocean depths, are there undergoing the same processes of solidification under the laws of crystalline forces, and assuming the character and form which will one day fit them to perform an important part in the drama of existence where they are to appear. It will not be affirmed that this new rocky strata which is being constantly reformed in the ocean's depths, according to a well defined law, will be barren of mineral treasures, or that it will be less suited to the activity of the future than the same class and character of rocks to-day exhibited.

Everywhere in the circle of existence around us, we behold death as a mother feeding life, and life folding itself in the garments cast away by forms which have lived and served their purpose before passing to a new state in the endless cycles of progression, through which all matter is passing in one form or another.—*The Mining Review.*

Science and Modern Discovery.

Professor G. C. Stokes, Secretary of the Royal Society of England, recently delivered a very interesting address before that body in which he gave an important account of the progress of physical science during the past quarter of a century, and in reviewing the results, specially noted that as scientific truth developed, so had men to give up the idea that there was any opposition between the Book of Nature and the Book of Revelation. He said that for the last twenty years or so, one of the most striking advances in science had been made in the application of the spectroscopic, and in the information obtained with regard to the constitution of the heavenly bodies. The discovery that there were in these particular chemical elements, which were also present in our earth, exalted our idea of the universality of the laws of nature, and there was nothing in that contrary to what he had learned in Revelation.

Entering with some particularity into the composition of the sun, the professor said this gave an idea of an enormous temperature, since iron existed there in a state of vapour. This was wholly inconsistent with the possibility of the existence there of living beings at all approaching in character to those we have here. Are we then to regard this as a waste of materials? Might we not rather argue that as in animals we ascend by greater specialization, so we could consider the differentiation of office in different members of the solar system as marks of superiority, and could regard the sun as performing most important functions for that system? In fact, all life on our earth was ultimately derived from the radiation of solar heat. Referring to the doctrine of conservation of energy and of dissipation of energy, he pointed out at some length how the sun, so far as we could see, was not calculated for an eternal duration in the same state and performing the same functions as now. We must regard the universe on a grand scale, and then there was progress. If we contemplated nothing but periodicity, perhaps we might rest content and think things would go on forever as at present; but, looking on the state of the universe on a grand scale as one of progress, this idea obliged us to refer to a first cause.

AN INVENTION FOR PRINTING MUSIC AS IT IS PLAYED.—An apparatus invented by Mr. Herbert Frang of Newburg, England, for printing music as played, is described as very ingenious, and should be of considerable usefulness to the ready composer of music. This device when placed in electric communication with a

pianoforte or other keyboard instrument, prints the music as it is being played. The machine derives its motive force from powerful clock-work. When in motion, a band of paper is drawn through the machine, and during its passage is ruled with the staff lines and passes under a number of small marking wheels, which corresponds to the keys of the pianoforte, and it is here that the music is recorded. The notation in which the music is recorded is not the ordinary one. When a note is depressed on the keyboard, which is in connection with the recording machine, the corresponding wheel will begin to mark, and the length of the line made will be in proportion to the length of note. Thus, if a line a quarter of an inch in length represents a quaver, a line an eighth of an inch will represent a semi quaver. This system of notation is easily translated into the ordinary notation by anyone who understands the latter. The connection with the keyboard is obtained by a pin fixed under each note which dips into a small cup of mercury. This arrangement in no way interferes with the touch of the keyboard. As the price of this instrument, 20 guineas, is moderate, it should find a considerable field of usefulness.

INTERIOR TEMPERATURE OF THE EARTH.—The German Government is having a deep shaft sunk near Schladebach, with the object of obtaining various kinds of scientific information, and especially trustworthy data concerning the rate of increase of the earth's temperature as we descend into the interior. The excavation is being carried on by a diamond-tipped borer driven by water. So far back as the beginning of this year the shaft had reached the depth of 1392 meters, which is believed to be the lowest depth yet reached by boring. The temperature at successive stages is ascertained by an ingenious instrument which serves as a special thermometer, the principle of construction being the fact that, as the heat increases the mercury will expand so as to flow over the lip of a sufficiently short open tube in greater and greater quantities. The measurement of the differences of those overflows will give the rate of increase of the temperature. It has been ascertained that the temperature at the depth of 1392 m. was 49° C., or 120° F. If the temperature increases regularly at this rate, the boiling point of water ought to be reached at a depth of 3000 meters, and at 75 km. we should find the heat at which platinum melts. This would go to show that the earth's crust cannot be more than about one-ninetieth of its radius.

THE WAY INCANDESCENT LAMPS ARE MADE AND THE AIR EXHAUSTED.—"The way that incandescent lamps are made is very simple," an electrician said recently. "There are different ways of preparing the filaments, which are shaped, carbonized, and treated at a white heat. They are then placed in platinum holders, imbedded in glass, and next go into the hands of the glass blower. The glass bulbs have round openings at the bottoms and little tubes at the tops. The little tubes all connect with a big tube. This is called a fork, and resembles a cluster of blackberries. Two or three dozen bulbs may be on a fork. The glass blower places filaments in each bulb at the bottom, and welds the glass about the platinum holders to the edges of the opening. Then the air is drawn from the bulbs. The open end of the big tube is attached to an air-pump, which has 40 pounds of mercury at its top. As the mercury drops it carries all the air with it, and vacuums are created in the bulbs. The operator then takes a Bunsen burner, and directs its flame against the little tubes close to the bulbs. This closes the bulbs, which are then removed from the big tube. The glass blower finishes them off. The exhausting of the air from so many lamps at once makes the cost small. The bulbs can be made by any ordinary glass blower, but it requires a man of intelligence to make the filaments."—*Electrical Review.*

A NEW SAFETY-LAMP.—M. Gaston Trouve is said to have constructed a portable electric glow lamp, intended for use where there is an explosive atmosphere. This lamp is intended to be of service in mines, cellulose factories, flour mills, spinning mills, etc. It is automatic in its action, and is stated to be very simple in construction. There are two varieties of the lamp made, one of which will only light when taken up in the hand, and the other when it is hung up or put down. The current is produced by a battery contained in the lamp.

PROMPTNESS OF IGNITION.—It is stated in a recent Government report that the quality of prompt ignition is so valuable in a naval vessel that it almost precludes the employment of anthracite in time of war in favor of a more free-burning coal, and that it has considerable advantages in time of peace. In this connection, it may be stated that the slack of anthracite is worthless on the grate of a boiler, whereas the slack of free-burning coal, if not too old, is tolerably efficient in the formation of steam.

GEORGIA'S NATURAL INK.—A natural ink is found at the bottom of a copper mine at the foot of the Kenesaw mountain, in Cobb county, Ga. It is a peculiar liquid of a deep wine color, and when a few drops of nut-gall are added it turns jet black, and at once becomes ink of the best quality. The records of the county have for years been kept in this natural ink, which neither fades, freezes, nor corrodes.—*Inland Printer.*

TABLE OF CONTENTS.

EDITORIALS.—Triumph Ore Concentrators; Profitable Lead Mining; Deep Mining for Gold, 145. Passing Events; Labor in Claims; The Prospector, 148. The Mechanics' Fair; A Magnetic Ore Separator; The Militia Encampment; A New Home Industry, 149.

ILLUSTRATIONS.—Triumph Ore Concentrator, Showing New Riffle Table, 145. The Spanish Bayonet in Bloom at Pasadena, 150. The Little Magnetic Ore Separator, 153.

CORRESPONDENCE.—The Russell Leaching Process, 146.

MISCELLANEOUS.—The Cassel Gold Extraction Process; Sweetwater, 146. The Volatilization of Gold; Mining Transfer; The Yucca, or Spanish Bayonet; A New Concentrator; The Outlook at Butte; The Marlin Elevator, 150. Ancient and Modern Warfare; A Word to Idle Miners; Mining and Scientific Press, 151.

MECHANICAL PROGRESS.—Influence of Mechanical Invention; Testing Steam Boilers; Tempering Drills; Steel Canal Boats; Steel Nail Cutters; Principles of Adjusting Bearings for Line Shifting; Weighting a Wooden Fly-Wheel; A Prize Offer; American Wheels in England, 147.

SCIENTIFIC PROGRESS.—Genesis; Science and Modern Discovery; An Inventor for Printing Music as it is Played; Interior Temperature of the Earth; The Way Incandescent Lamps are Made and the Air Exhausted; A New Safety-Lamp; Promptness of Ignition; Georgia's Natural Ink, 147.

USEFUL INFORMATION.—Sweet Toothed Americans; The Care of Canaries; A Chat About Car Wheels; Paper Slippers; California as an Oil-Producing Country; Genius and Common Sense; A Wash for Old Painted Wood-work; A Good Brown Oak Stain; Marine Animals; Important Enterprise; A Swift Flowing River; Cement for Petroleum Cisterns; A Remarkable Bedstead; The Divining Rod, 151.

GOOD HEALTH.—Fresh Air and Ventilation; Riding up Steep Grades; Sanitary Science; Mind and Disease; Sleeplessness; How to Take a Pill; Milk; Beer from Bananas, 151.

Passing Events.

The Mechanics' Institute Exhibition was opened this week and is being largely attended. There are many novel displays this year, and prominent among them are those of the counties of the State, which exhibit their peculiar products. In this branch there is expected to be much rivalry.

As will be noticed in our mining summary, another of the big Comstock mines has put a full complement of men at work after a period of idleness. For a long time there has been no development of magnitude made in that region, but those having faith in the old lode still look forward with hope to better times.

There is little to report concerning the mines of this State. Work is going steadily on and many mines are being quietly developed. There are plenty of profitable ones among them of which the public hear little, since the mines are not listed on the stock boards.

THE DISCOUNT ON BULLION.—H. H. McCollay shipped two bars of bullion from the Wild Deer mine, at Willow Creek, Humboldt county, to San Francisco last week. The returns, says the *Winnemucca Silver State* show that the assayed value of the bullion was \$4,132.11; the discount on the same, \$630.14, and the assayer's charges \$10.16, making the net value of the bars \$3,491.81. About one-third of the value of the bullion is gold, otherwise the discount would have been more. This is enough to discourage silver mining.

Labor on Claims.

It is imperative by our mining laws that the claimant when filing his application for patent, or at any times thereafter within the 60 days of publication, should file with the Register a certificate of the U. S. Surveyor-General that \$500 worth of labor has been expended on improvements made upon the claim. This certificate must be filed before the expiration of the 60 days of publication. Some Colorado miners have had their mineral entry canceled because they failed to do this.

It appears that the owners of the Little Pet lode claim made application for patent for said claim, and notice thereof was given by publication and posting, as required by law. During the period of publication claimants of the Deposit lode filed their adverse claim and protest against the issuances of patent to the owners of the Little Pet. After some time had passed, however, the original entry was allowed, the adverse claim having been silenced by a decision in favor of the Little Pet.

Just after the Little Pet entry was allowed the claimants of the Deposit lode filed in the district Land Office a protest against the issuance of patent upon the Little Pet claim, upon several grounds, to wit:

1st. That no mineral had been discovered by the locators of the Little Pet claim or their successors in interest, within the limits of their location.

2d. That the applicants had not expended \$500 in labor and improvements on the claim.

3d. That the premises in conflict were not the property of the claimants, but belonged exclusively to the protestants.

The protestants also aver that the reason that they did not commence suit upon their adverse claim within 30 days was because their counsel was seriously ill.

The Commissioner of the Land Office held that it was only necessary to pass upon the question whether the required value in labor and improvements had been expended upon said claim, and that the record failed to show that any certificate of the United States Surveyor-General, showing that the required labor or improvements had been expended upon said claim, had been filed in the case. It was also shown by the report of the U. S. Deputy Mineral Surveyor, relative to his survey of said claim, that there had not been expended thereon in labor and improvements the value of \$500. It also appeared that the portion relative to the value of labor and improvements, in the certificate of the U. S. Surveyor-General accompanying the plat of survey and field notes of said claim, was crossed out. It was therefore decided that unless the proper certificate of the Surveyor-General was filed with the Register, the action of the district land officers in allowing the entry was erroneous, and such entry, in view of the protest and adverse claim, could not be confirmed, but in the event that said certificate was duly filed, the Register and Receiver were directed to order a hearing to determine the nature, extent and value of the improvements made by the applicants for patent and their grantors. No appeal appears to have been taken from said decision.

After this, however, the certificate of the U. S. Surveyor-General was filed to the effect that the value of the labor and improvements on the Little Pet claim was not less than the required \$500. The Land Office, however, held that the certificate was not duly filed, and the entry was canceled because this certificate was not filed at the proper time. Still, they gave 30 days more to appeal. The appeal was made from the decision, and the Secretary of the Interior has decided that the Land Office decision was correct. In effect this is that the certificate must be filed before the end of the 60 days of publication, or it is not in accordance with law.

A DISPATCH from Redding, Shasta county, says that the actual sale of the Iron Mountain mine to practical miners for \$200,000 is confirmed by James Salles, one of the late owners, who will remain in full charge of the mine. They will proceed immediately to construct a road from the mine to Copley Station, on the railroad and erect works. The shaft in the Sherer & Radler mine, when down 40 feet, struck a new body of tellurium ore. The ledge is nine feet wide.

THE paper mill at Linwood, Los Angeles, has proved very successful.

The Prospector.

In an article a few months since, in speaking of the character and uses of the mineral prospector, we remarked that he should be duly encouraged and not be looked upon as a vagrant who dislikes regular, hard work. Many good miners make poor prospectors, this being a kind of work for which some men are particularly adapted, and because they lead a nomadic life is no reason that they are not as good citizens as those living in towns and following more regular pursuits. They are the pioneers of the mining camps and serve a most useful purpose, since the result of their searches is the basis of the mining industry.

What is here said is very true, and we might have added that but for the labors of the prospector many parts of our mineral domain, now well known and thickly populated would, in all probability, have remained to this day but sparsely settled, if not wholly a *terra incognita*.

Of the genuine, successful prospector, as of the poet, it may be said, he is born, not made. To succeed in this calling a man must possess certain inbred aptitudes, without which he will be likely to fail should he devote himself to the business. He should be of a hopeful temperament and an easy going disposition, should have a quick eye to detect not only mineral indications but also Indian signs, weather prognostications, etc. Having passed over a country he should be able to remember all its natural features, landmarks, trails, etc.; know the long, dry stretches, the good camping places, where there is wood, water and grass, so that neither he nor his animals may suffer—especially the latter. The prospector must be brave, hardy and self-possessed; capable of confronting danger coolly, and full of resources to meet an emergency. He must, of course, be careless of luxuries and even comforts, content to lie down solitary and sleep in the woods, and finally take the chances of perishing, as many of this class do, alone in the mountains or far out on the arid desert, "his shroud his gray blankets, his sepulture the drifting sands."

The prospector never gets financially stranded till he strikes the city: as long as he stays in the mountains he manages by some inexplicable means to raise a grub stake and keep in the field. If, having struck some big thing, he is tempted to seek the city in the hope of selling the same or inducing some one to take hold and help develop it, the chances are that he gets dead broke and finds it difficult to raise the wherewith to take him back to his old haunts, this being effected perhaps by his running across some credulous person, who, listening to his stories of bonanzas lying around loose, helps him out, hoping to capture a few of these through a small money advance. Formerly plenty of people could be found ready to cash these drafts on the future. Of late, however, they have, to the grief of the prospector, become distressingly scarce. In the days of mining stampedes and early mineral exploration there were those who went to hunt for other things than gold and silver. There were prospectors for ranches; toll road and water franchises, town and mill sites, coal and wood lands, and even for newspaper openings, these journalistic ventures being sometimes engaged in on the strength of very feeble indications—prospects that showed hardly more than a color to the pan.

To write up the history of some of these mineral explorers would form a very interesting chapter in the mining annals of the country. Thinking over the list we recall a few of these names, though others there be, equally entitled to notice, that do not now come to mind. There was Dr. John A. Veatch and Andrew, his son, who well represented the quiet, gentlemanly, educated school of prospectors.

Living first in Texas, where they saw much wild life, the business came natural to these men on their advent in California, to which country they emigrated at an early day. Having a thoroughly scientific education, the father, on his arrival here, almost at once began the search after other forms of mineral wealth than gold. To him is due the credit of having first discovered borax in California, and we think also some other of the useful minerals, both in this State and elsewhere on the coast. Nor were his original researches confined to the mineral kingdom; they were extended to other departments of the natural science, botany having claimed much of his attention.

The son Andrew, a most amiable and intelli-

gent young man, found his highest pleasure in traversing the deserts and exploring the mountains of the distant interior, hunting for mineral deposits, a business in which he was eminently successful. He was the discoverer of the Reese river country in Central Nevada, also of the Cortez district lying to the north of it, both containing many valuable silver-bearing lodes, some of which are being successfully worked at this present time. Though the means of finding and pointing out to others the sources of so much wealth, neither of the Veatches ever acquired much wealth themselves—died, in fact, rather poor—a condition largely due to an easy-going generosity exercised with so little discrimination that it bordered on absolute unthrift.

Breyfogle, the discoverer, or rather, perhaps, it should be said, the re-discoverer of the Lost Ledge, so-called, was another natural, or at least habitual prospector. This Lost Ledge was a vein deposit rich in gold, situated in or on the confines of Death valley, on the northern border of the Mohave desert. According to the tradition it was first found by some immigrants coming to California by way of Salt Lake and the southern route, who brought with them some pieces of very rich rock. Several ineffectual attempts having been afterwards made to find this deposit, it came to be known as the Lost Ledge. About 1863 Breyfogle, leaving Central Nevada, where he had been pursuing his favorite vocation, set out all alone to find this ledge, which he, no doubt, succeeded in doing, as he brought back with him a quantity of ore rich in gold. The next year, in attempting to return to the place, he was attacked by the Indians and so badly wounded that he was forced to retreat, having been barely able to make his way back to Ione, in Nye county, whence he set out. This hurt, though it did not immediately prove fatal, put an end to the veteran's weary journeyings over the deserts, having so crippled him that he could no longer well get about and finally caused his death.

"Quartz Johnson," who, when not out peregrinating about the country in search of minerals, can be seen almost any day on the streets of San Francisco, is another veteran and inveterate prospector, being a good example of the hopeful, active, enthusiastic type. Never, we venture to say, has "Quartz Johnson" been known to talk on any other than mining subjects, nor has any one ever discovered him when he was not loaded down with mineral specimens of one kind and another, this being his normal condition. If a word is said in his hearing about gold, silver, lead, copper, iron, anti-mony, tin, tellurium, salt, soda, borax, or any other metal or mineral useful in the arts or known to science, then doth "Quartz Johnson" on the instant pluck from the depths of his capacious pockets a sample of that same stuff, and exhibiting it proceed to describe what it is, whence it came, and what he intends to do with it, and everybody knows him, for he is not hard to get acquainted with. What grips and signs and passwords are to the various fraternal Orders, the word mineral is to him, its mere mentioning opening his heart and making him akin to all the world. But, though a great talker, Johnson talks well, being generally intelligent, conversant with mining matters and a good judge of minerals.

Two of the most noted prospectors ever in the field consisted of Joel S. Mead and his companion, the name of whom we do not know, and probably will never know, as both these men are now dead. Mead arrived in California from the State of New York early in the summer of '49, and at once proceeded to the southern mines, where he always made money, though never stopping long in one spot. Even at that day, flitting from place to place, he distinguished himself as the finder of new diggings. In 1858 he went to Frazier river, having been in the van of the tumultuous outbreak that occurred at that time. From Frazier river he went the next year to Idaho, where he was among the first to discover and work the rich gulches for which that then almost unknown Territory afterwards became famous. At that time the country swarmed with hostile Indians, rendering the life of the miner exceedingly precarious. Journeying on to Montana a year or two later he repeated there the rough and eventful experiences he had gone through in Idaho, rich diggings everywhere, with death and danger all round.

After joining a movement in Montana to

clean out the cut throats who infested that Territory, attacking solitary camps and murdering all indiscriminately who were supposed to have money. Mead and his companion, turning their faces south, traveled all the way to Southern Arizona, and soon after on into Mexico, whence, after a while, they returned to Arizona. While in that section of country they were engaged in many fights with the Apaches, in one of which Mead's companion was killed, an event that appears to have affected the latter deeply. It is related that on this occasion he rushed ahead of his party and avenged the death of his associate by slaying two of the savages, one of whom he dispatched with a knife, having come to too close quarters to admit of the use of fire-arms. On seeing his comrade fall, Mead is said to have laughed out like a maniac, this being the only occasion on which he was ever known to give way to any strong manifestation of joy or sorrow. Sedate and immovable, he was at the same time warm hearted and generous, and as brave a man, perhaps, as ever lived, having been noted even on the mining frontiers for his cool and desperate courage.

After having spent several years in Southern Arizona and Northern Mexico, Mead left that region and went to the Black Hills in Dakota, where he acquired some valuable quartz interests. But remembering that he had, when going from Frazier river to Idaho, seen in the Kootenai country an immense deposit of galena, he could not rest till he had gone back and further examined the same, which he did four or five years ago. While engaged in this work he was killed by an explosion of powder, dying while yet a comparatively young man. This body of galena has since become the property of a rich company of which Capt. Ainsworth, formerly of Portland, Oregon, but now of North Temescal, Alameda county, is president. The company considers the deposit very valuable.

We would be glad to continue these sketches of the more notable of our early prospectors, and may do so at another time, having devoted to the subject as much space as can just now be spared for such purpose.

The Mechanics' Fair.

The opening exercises of the 20th Annual Exhibition of the Mechanics' Institute took place at the Grand Opera House, on Tuesday last.

President P. B. Cornwall delivered the opening address, briefly reviewing the objects of the institute, which had "cleared a path of progress and cast up a highway on which social industry may go forward," and welcoming the audience in its name.

Hon. H. C. Dibble delivered the annual address, and the remaining numbers of the programme were as follows: Opening march, "God Save America" (Ellenberg), by the orchestra; prayer, by the Rev. E. G. Beckwith; grand overture (composer, Charles Schultz), by the orchestra; cornet solo, "Brilliant," performed by Mr. John Donnigan; song, "Good-By" (Tosti), by Miss Rose Courson; recitation, "Forging of the Anchor" (Ferguson), by Miss May L. Cooper; "Prestissimo Galop" (Waldteufel), by the orchestra.

There was a very large attendance at the exercises, showing the interest the people of San Francisco feel in the fair. The exhibition has already attracted thousands of visitors, and although not quite complete in all its appointments, shows that it will probably excel its predecessors. The building itself has been thoroughly overhauled, repainted and refurnished throughout. It has been made more attractive than ever before. The old circular fountain in the center of the main aisle has been replaced by a massive one of granite, surmounted by a bronze figure of Neptune reaching half way to the roof. On three sides of the fountain are bronze dolphins. The band stand has been placed in the middle of the hall, where the fountain formerly was. In the gallery, just back of the fountain is stationed the great organ built by Bergstrom. A profusion of vari-colored streamers and bunting decorates the roof and sides of the hall, while at intervals from the balcony railing is hung blue, fringed with white.

The artesian well at White Plains, Nevada, after being sunk 2250 feet without striking flowing, fresh water, has been abandoned. It cost \$100,000.

A Magnetic Ore Separator.

At Příbram, Bohemia, in the Lill ore dressing works are two magnetic separating machines used for the separation of iron ore from zinc blende. Mr. Ellis Clark, Jr., described them in a paper read before the American Institute of Mining Engineers. The engraving on this page shows the machine. The iron ore and zinc blende are separated from other material by the ordinary concentration processes, and are then in the form of a powder, the grains being less than 0.04 inch in diameter. This powder is composed of spathic iron ore and zinc blende, and is roasted in a small oven, with frequent stirring, for an hour, when the iron ore is rendered sufficiently magnetic. It is then placed in the hopper of the machine, which is shaken by a *dumpling*, or cam, A, keyed to an iron shaft, and moved by belting and pulleys. The ore falls from the mouth of this hopper into a hollow cylinder of wood with open ends, around the circumference of which horseshoe magnets, B, are set into the wood, so that their poles project about 0.39 inch into the inside of the drum, or wooden cylinder. Outside the drum, and 15.75 inches apart, pieces of hard wood, C, are nailed. They are triangular in section, and, by the revolution of the drum, raise a stiff and elastic wooden spring, D, 3.28 feet long, 2.36 inches wide, and 1.18 inches

MACHINE FOR SEPARATING ORE BY MAGNETISM.

thick at the base, coming to an edge at the apex.

When the triangular cam releases the wooden spring, the latter strikes the drum a sharp, quick blow, sufficient to knock off any particles of zinc blende that may have attached themselves to the magnets, or the inside periphery of the drum, and partially jarring off the particles of iron ore that are attached to the magnets in the portion of the drum that is uppermost, and close to the elastic stick, but not the more strongly magnetic pieces of ore.

The iron ore that reaches the upper portion of the drum and is then jarred off falls on a sheet-iron shoot, N, and the strongly magnetic particles are now swept off the magnets into the sheet-iron by means of a revolving brush, E, aided by the jarring of the wooden spring, and run through the shoot into a receptacle, F. The brush is provided with stiff bristles, and has two motions, one a revolution on its axis, given by a screw and pinion, G, and the other a back and forward motion, produced by a crank, H, operated by a pulley and belting on the other side of the drum. Within the axle of the brush, which consists of a piece of gas-pipe, is a ball and socket-joint, I, which permits this double motion. The large wooden cylinder has a narrow iron band running around its edge on both sides, which fits into four small grooved wheels, J, on which the drum rests; two of these wheels are connected by a shaft, and the other two are disconnected from the first two and from each other. Motion is communicated to the first mentioned grooved wheels by a belt-pulley, R, on the same shaft, while the latter two merely support the drum and turn with it. A small pulley on the same shaft as the connected grooved wheels gives motion by means of a cord belting to a horizon-

tal pulley, L, at the base of the upright shaft, M, on which the screw, G, is cut, which turns the pinion keyed to the axle of the brush. On the other side of the drum is a pulley which turns the shaft on which the cam (*dumpling*), belonging to the hopper, is placed, and communicates motion by means of a belt and small pulleys to another shaft which near the middle is bent into a crank, and gives the backward and forward motion to the revolving brush.

In one machine small horseshoe magnets, to the number of 511, are used. These are the ordinary sized magnets which are sold as toys in the philosophical instruments shops, and are 3.15 inches long, 0.59 inch wide, and made of 0.12 inch plate. The other machine has 120 very large horse shoe magnets, 7.87 inches long, 1.18 inches wide, and made of 0.24 inch plate; in addition there are 104 small ones. The feed is quite slow, and, to obtain the best work, the machines must not make more than five revolutions a minute. Each machine separates four cubic feet of iron ore from the zinc blende in a day of 12 hours. They have been 13 months in use, and are very well liked, the preference being given to the one working with small magnets, as the large ones make the machine very heavy, so that it does not run smoothly. The separated zinc blende falls to the bottom of the drum, and by slow revolutions, gradually works towards the sides, where

duties. It is to be hoped that similar gatherings of our militia-men will be held annually in the future. One of the best places in the State was selected for the camp, and Santa Cruz was unusually lively and gay—a very large number of visitors, aside from the soldiers, being present.

A New Home Industry.

Manufacture of Eucalyptus Boiler Scale Preventive.

There is a plain looking little factory back of Lake Merritt, in the Piedmont hills, Alameda county, where they are manufacturing from the leaves of the eucalyptus tree an extract for the prevention of scale in boilers. There are numerous groves of the blue gum (eucalyptus globulus) in the vicinity, so that the raw material is abundant. The leaves and twigs are stripped from the branches and crowded into retorts. In these retorts are steam pipes into which steam at 40 pounds pressure is led. After several hours' treatment the desiccated leaves are withdrawn; the liquid extract and oil formed during the operation being drawn off and separated. The oil is shipped to Europe, where it is used for medicinal purposes, and the extract is put up in five-gallon cans or barrels, ready for use.

The discovery of the efficacy of the eucalyptus leaves for removing and preventing boiler scale, was an accidental one, and was made by George Downie, of Salinas. Experiments were then made, and it was found that the extract from the leaves served the same purpose. A company was formed and a factory started, since which time—a couple of years past—the substance has been widely used, about 1500 gallons a day now being made. The shipments to New York and Liverpool since January 1st have aggregated nearly 100,000 gallons.

The market is by no means a local one, large quantities being shipped to Liverpool and London as well as to the Eastern States. It has been adopted on the transatlantic steamship lines and been found very successful indeed. Exhaustive experiments are now being made with the extract in the English Navy.

It is in use on the Pacific Coast steamship lines and by a number of prominent steam users in this city, and elsewhere in the State, having about displaced compounds for similar purposes. It has been tried successfully in the U. S. Navy, the Chief Engineer of the U. S. S. *Ranger* reporting that the "use of eucalyptus has been proved to protect the iron of the boilers from corrosion."

After examining the compound, Prof. E. W. Hilgard says: "After removing the tannin as far as possible by digestion with animal membrane, the acid reaction shown by the extract was found to be equivalent to only .127 per cent of sulphuric acid, an amount so small that it is doubtful whether the cleansing action upon boilers can be attributed to acid solution." This is a great point, for if the scale is not removed by acid it cannot injuriously effect the boiler, and shows that it does its work thoroughly. It has been used in boilers of every description, and in all kinds of water both on land and sea, and the engineers who have tried it have found it efficient in removing and preventing the formation of scale, whether carbonate of lime, sulphate of lime or carbonate of magnesia.

The substance is purely vegetable, and will not cause foaming or priming, as it tends to prevent it in alkali water. Another curious feature also is that it prevents pitting or corrosion, dispensing with the necessity of using zinc. In a stationary boiler, one gallon for each 15-horse-power is put in at the beginning of each run of two or three weeks; in steamboat boilers, one gallon to each 40-horse-power.

The extract is made by the Downie Boiler Incrustation Preventive Co., of this city, and agencies have been established in the principal cities in the United States and Europe. Patents have been obtained in the principal countries of the world. Although this home industry is a comparatively new one, it has made very rapid advances, and the product is known favorably abroad already. Mr. Joseph McGillivray is now in Europe introducing the extract, and has met with great success. Judging from the testimonials received by the company, some of which appear in our advertising columns, this extract is remarkably efficient in serving the purposes for which it is intended.

The Militia Encampment.

This year, for the first time, the different regiments of the National Guard of California have been in camp together, in command of the Major-General. The State encampment was at Santa Cruz, and continued for one week. During this time the routine of camp-life was performed, there were drills, inspections, parades, etc., and on the last day there was a grand sham battle, at which the Governor of the State and other notables were present.

The citizen-soldiers are reported to have acquitted themselves creditably during the encampment. All the details of camp-life were carried out for the instruction of officers and men. To militia whose chief duties have been in the armories or the street, there was much to learn, and the experience gained in this encampment must be of benefit to them all.

It is to these men, in the various cities of the Union, that the Government will look to first in case of insurrection or war. As they are schooled in military tactics, their experience would be of great benefit to the country in case numbers of recruits should be suddenly called for. And for these reasons, encampments such as the one which they have just experienced, are not only useful to the officers and men, but to all citizens. While allowed to indulge in rather free social recreations, upon which some criticism has been made, discipline was maintained sufficient to train the men in their camp

The Volatilization of Gold.

Though it is popularly assumed that gold is not volatile, yet metallurgists have long known that under certain conditions it can be volatilized. Thus gold-foil sublimes in a current of chlorine at 300 degrees C., as auric chloride, and auric chloride combines with a number of metallic chlorides, forming double salts called chloro-aurates, and it is probable that some of these little-studied compounds are more volatile than the auric chloride itself. In the so-called "Miller's chlorine process" for refining gold by passing a stream of chlorine gas through molten gold, which has been for years in successful operation in the Royal Mint, Sydney, Australia, a certain loss of gold occurs by volatilization in connection with the chlorides of silver and some of the base metals.

Though the fact of gold volatilization in roasting certain gold ores has long been known, and has been made public by Kustel, Rlotte, Aaron and others, yet the extent of this loss does not appear to be generally appreciated. In "Leaching Gold and Silver Ores," published in 1881, Mr. Charles H. Aaron, mining engineer, of San Francisco, says that in the chloridizing roasting of gold ores he found that he was sustaining a heavy loss in gold—a loss which, before he discovered its cause ("being a novice in this branch of metallurgy"), had amounted to some \$3000. He then made tests in a muffle, and found that with four per cent of salt there was a loss of more than 50 per cent of the gold. Or, to use his words, "I weighed two half-ounces of a sample and roasted them in a muffle side by side, under precisely the same conditions, except that to one of them I added four per cent of salt. The roasting was purposely pushed to an extreme as to heat and time, and when the two sets were assayed, under exactly similar conditions, that which was salted was found to contain less than half as much gold as the unsalted one."

"I then took some light, fluffy sublimate from the flue of the roasting-furnace, an assay of which gave me a value of some \$600 per ton, chiefly gold. The quantity of this material was, however, very small, and the bulk of the matter in the dust chamber was not much richer than the average of the ore treated, a circumstance which indicates that the gold was actually to a great extent volatilized in some not easily condensable form. . . . As soon as I made the necessary change by reserving the salt until the nearly dead roasting of the ore was finished, not only did the roasted ore assay 20 per cent richer than when raw, but the yield overran my guarantee."

I afterward found that a very small quantity of salt—not more than three pounds to the ton—might be mixed with the crude ore without detriment to the gold, and with decided advantage to the extraction of the silver."

This subject has recently had attention directed to it by some very interesting experiments in chloridizing roasting made by Mr. C. A. Stetefeldt, mining engineer, of this city. These experiments form, we understand, the basis of a paper to be presented at the next meeting of the American Institute of Mining Engineers; and we should have deferred our notice of the subject until that time, but that we noticed Mr. Stetefeldt's experiments have been communicated from "Advance-sheets" of his report to the London Mining Journal by a correspondent, who, with some fulsome flattery (which must be rather embarrassing to Mr. Stetefeldt), announces the discovery of the heavy loss of gold by volatilization in this case as a "remarkable result," "nowhere on record," etc.; whereas, in fact, it has for years been known among metallurgists. Mr. Stetefeldt's experiments, though conducted on a small scale, are extremely instructive, and form a marked progress in the investigation of this important practical problem.

The ore of Las Minas, Zamelehuacan, Mexico, on which Mr. Stetefeldt's experiments were made, is composed of from 40 to 60 per cent magnetite, from 3½ to 7 per cent copper pyrites, and from 3 to 22 per cent iron pyrites. The ore loses only from 1 to 3 per cent in weight by an oxidizing-roasting. It contains from 0.3 to 0.8 ounce gold per ton of 2000 pounds.

Mr. Stetefeldt's roasting experiments consisted of oxidizing and chloridizing roasting in a small reverberatory furnace, with charges of 200 pounds, the capacity of the furnace being at most 500 pounds.

As might have been expected, it was found that "a mere oxidizing-roasting leaves a large percentage of the magnetite intact," and "a direct chloridizing-roasting removes the magnetite almost completely and very rapidly," but with a heavy loss in gold. Mr. Stetefeldt says: "In determining the gold value of the ore before and after chloridizing-roasting, I found an enormous loss of this metal by volatilization;" and as did Mr. Aaron, Mr. Stetefeldt repeated the experiment by roasting for one hour with 3 per cent salt in a muffle. The following were the results: 2 and 4 were partially roasted before adding the salt:

CHARGES ROASTED IN THE REVERBERATORY FURNACE			
Number	Before chloridizing-roasting.	After chloridizing-roasting.	Present loss.
2.....	0.916 oz.	0.420 oz.	53.5
4.....	0.202 "	0.150 "	42.8
5.....	0.533 "	0.075 "	80.1
6.....	0.050 "	0.075 "	88.5
CHARGES ROASTED IN THE MUFFLE.			
1.....	0.700 ozs.	0.050 oz.	93.0
2.....	0.525 "	0.075 "	85.7
3.....	0.650 "	0.065 "	90.0

"There is no doubt that the volatilization of the gold takes place with that of the cuprous chloride. It increased with the quantity of cuprous chloride formed, and then volatilized and decomposed. It is also a function of temperature. Finally, I am convinced that the magnetite, as a contact reagent, plays an important part in causing this loss, a fact that invites further investigation."

These experiments and deductions are extremely interesting and instructive, and when repeated on other classes of ores and on a large working scale may lead to important economic results. Were it not for the well-known difficulty of condensing the volatilized precious metals, Mr. Stetefeldt suggests that "we would have here a most simple and perfect method to extract not only the gold from the Las Minas ores, but gain considerable copper besides."

Mr. Stetefeldt proposes oxidizing-roasting the ore in Stetefeldt shaft-furnaces—a complete change of the magnetite to ferric oxide is not

The Yucca, or Spanish Bayonet.

The engraving on this page shows a magnificent specimen of this plant. It was engraved from a photograph of a plant that bloomed in Pasadena in the summer of 1884. The exact age of the plant is not known, but it is not more than eight or nine years ago that it was transplanted to the spot where it bloomed and died. It was growing in an orange orchard, as shown in the picture, and received the care and cultivation that the orange trees did; the result is shown in the engraving. In their wild state, the bloom stem seldom attains a height of more than eight or twelve feet, while this one measured about 25 feet in height. The shaft or flower stalk is the growth of but a few weeks; and as it stood with its top completely covered with creamy-white flowers, it was a sight that is seldom seen. While in bloom it was visited

THE SPANISH BAYONET IN BLOOM AT PASADENA.

necessary—and amalgamation with dry gold or silver amalgam in an arastra in preference to an iron pan. Liquid quicksilver was not found advantageous, a fact already remarked by other metallurgists in similar cases. Mr. Stetefeldt believes it possible to extract from 90 to 95 per cent of the gold by this method.—*Engineering and Mining Journal*

MINING TRANSFER.—The Mayflower Mining Company has concluded the purchase of the mining property adjoining its own in Placer county, and belonging to Anthony Clark and F. Chapellet. The claims purchased are the Justice Consolidated, Golden Eagle, Bedrock, Hull and Lookout. The considerations are as follows: \$6000 paid down, \$28,500 in one year, another \$28,500 each in three, six and nine months thereafter, in all \$120,000. At the end of a year the purchasers have the option of paying 5 per cent per annum on \$114,000 and extending the time for payment to two years. Possession is to be taken by the Mayflower company at once. A tunnel is to be driven in Brusby canyon, and the sellers, Messrs. Clark and Chapellet are to have joint use of it with the Mayflower Company.

by hundreds from all parts of the county. This species of the yucca (*yucca baccata*) dies after it blooms. The plants are quite numerous on the mountains and foothills in the southern part of this State, and when in bloom their white crests can be seen for miles, towering above all else.

Mr. W. W. Bliss, of Duarte, says he has seen it stated that the bees gather large quantities of honey from this plant, but he does not think that this is the case, although he has seen bees at work on the flowers. The most important use of this plant to the bee keepers is the brushes which are made from the leaves that grow at the bottom of the plant. These brushes are decidedly the best thing that has yet been discovered for brushing bees off from the combs in extracting. They are a vegetable fiber, soft and pliable, yet almost indestructible, and never come loose in the "handle," no matter how much they are exposed to the weather. Mr. Bliss secured the leaves of the plant shown in the engraving, being the largest that he had ever seen, and made from them magnificent brushes for the purposes stated. We understand that they are made and sold to bee-keepers by dealers in supplies for the apiary.

A New Concentrator.

From the Denver *Public Opinion* we take the following description of the new "Matchless Concentrator," owned by the Tahor Investment Co., of Denver. It has a motion almost identical with the miner's gold pan, and requires a stream of water supplied from a 1½ inch pipe. About five-horse-power is adequate to run the machine. It has capacity to treat from two to four tons per hour, saving from 75 to 90 per cent of the mineral contained.

It is mounted on a base of 12-inch square timbers, 14 feet long and eight feet wide, over the center of which runs a shaft connected by bevel gear to an upright shaft at either end. The upright shafts are 2½ feet long, and terminate in horizontal adjustable cranks, having movable wrist-pins, which fit vertically into short, horizontal shafts, supporting a frame of three-inch gas-pipe, 14 feet long and 17 feet wide, which frame is suspended at the middle of each side by hearings on the journals of the short horizontal shafts, thus holding said frame rigged longitudinally, but allowing lateral motion. Four iron posts with ball and socket joints at either end, rest between the frame and base, one at each corner, supporting the burden. These posts have their bases inclined inward, and adjustable curved iron bed plates, and give a lateral oscillating movement to the frame while the cranks are rotating it.

The pitch of the machine is at an inclination of three-eighths of an inch to the foot, so that when the plates are full at the mouth they are nearly a feather edge at the back. The ore belt of plates is moved slowly backward, automatically, by means of an adjustable ratcheted wheel attachment, the speed of which can be regulated at pleasure. Twenty-four rows of pans are on top forming the incline ore table, at one time, which inclination is also adjustable.

At the head of this ore table clear water is fed upon it in small jets from a pipe resting just above the upper or rear octagon carrier, and cleaning the partially concentrated mineral, flows from one plate forward to another, one-third the distance of the ore table, where it comes in contact with fresh ore pulp, fed from a hopper there mounted; thence, carrying the tailings or wastage of the ore with it, it flows and discharges upon an inclined chute or apron, in front of the forward carriers.

During this flow of mixed water and ore or pulp, it is roasted, oscillated and jarred in each row of pans successfully at the rate of 120 revolutions per minute, and the mineral contained in the ore settled to the pan bottoms and against the circular riffles, while the tailings pass over forward.

The backward, continuous, slow motion of the ore-belt inverts the pans, and the mineral concentrates are washed off by jets of water into a stationary tank under the rear octagon carriers. The movement of this panning machine is made wholly adjustable, so as to adapt it to every character of concentrating ore.

THE OUTLOOK AT BUTTE.—The Butte *Inter-Mountain* says: Mining events of the past month have all been of an encouraging character. On a number of the principal mines of the district deep explorations are being pushed with good results. No better evidence could be asked of the faith which mine owners have in the permanent productiveness of their properties than the expenditure of money in the lower levels, and in the sinking of shafts. There is very little surface work being done now in any of the leading silver and copper mines of Butte, but down in the 600, 700 and 800-foot levels active exploration seems to be the order of the day. This is the case in the Anaconda, Lexington, Alice, Colusa and other well known mines, and it means that the ore reserves are to be increased and the output enlarged. Within the past week several important strikes have been made, notably in the Goldsmith and Blackrock. From the Bluebird come reports which almost stagger belief, yet they are not overdrawn. Rumors are also received of the early resumption of operations on several well-known properties which have been allowed to lie idle for some time for reasons best known to the chief stockholders. The mills and smelters are all making a record and turning out more hullion and matte than ever. Particularly is this true of the Moulton and Lexington. The Alice is getting in good shape to increase its product as recent developments in the company's mines give promise of richer ore. The Silver Bow mill is making a good run from leased mines. The smelters are in active operation. The new water jacket smelter on Silver Bow creek will soon be ready to start up. From Anaconda come reports of increasing activity and when the new concentrator shall be finished the company will be in much better condition to produce an increased quantity of metal and at a decreased cost. The plant is now running like clock work.

THE MARTIN ELEVATOR.—The Oroville *Mercury* says that L. L. Robinson, Pres. W. A. Radford, Secretary, and D. Stokes, Superintendent, of the North Bloomfield mine, reached that place and visited the Cherokee and Miocene mines. The gentlemen were delighted with the Martin Elevator, at work in the Miocene, and Mr. Robinson thinks it is the finest application of water power he has ever seen.

Ancient and Modern Warfare.

The only real difference between ancient and modern warfare is the application, in recent times, of steam, gunpowder and dynamite. These changes have, of course, involved machinery and appliances for their use and application. To effect the same amount of execution modern armies are not necessarily as large as those of ancient times, for the reason that a much larger part of the work of war is now done in the shops and foundry. Those who make the powder and fill the cartridges are as much a part of the army as those who fire them off. So with the foundrymen and mechanics who make the cannon.

In naval warfare we have actually gone back, within the last few years, to one of the most common and effective expedients of the ancients—that of ramming an adversary.

"Science," says the *London Spectator*, "has not yet said its last word on the adaptation of nature's secrets to resistance against rapine, carnage and wrong, whether exercised by nation against nation, or individuals. Even now substances are known to chemists which it only needs finer mechanical skill to convert into efficient and invincible agents for defending civilization against barbarism and savagery. What secrets may be, and no doubt are, hid in the womb of nature, and are waiting to be revealed by the hand of science, can only be conjectured. But we may be sure of this much—that the higher the civilization, and the more developed the intellect of the future, the more hopeless will become the attempts of needy and adventurous barbarians against the well being of highly civilized nations. If the Romans had left to Britain, with their civilization, a body of physical knowledge, similar to that of to-day, the subsequent Saxon Conquest would have been impossible."

The *Spectator*, in another article, in alluding to the opinion which some are beginning to entertain, in regard to the possibility that the terribly destructive nature of modern implements may possibly put an end to warfare, says:

There is not the slightest certainty that any invention, however terrible, would put an end to war; while there is almost a certainty that if such an invention were perfected it would grievously increase the miseries of mankind. Taken in the lump, men will face any means of destruction whatsoever, if also they possess it themselves. Give two men pistols, and they will fight across a handkerchief. They are not afraid of death, but only of death without a chance of victory. King Theodore of Abyssinia asked his courtiers, when the rocket shells fell at his feet, if he could reasonably be expected to face things like those, and ultimately, in pure despair of defeating science with unscientific weapons, killed himself; but if he also had possessed rockets, he would have fought on. No men, not even Prussian soldiers or English sailors, will face shells without shells to throw back; but when they have shells they face the enemy's shell as bravely as they did the old round shot. The methods of war are changed by science, but war is not extinguished. Suppose it true that able chemists and mechanics could invent a method of throwing an asphyxiating vapor on a sleeping army, what would be the result? First, the adoption of some protective covering, such as iron-clad huts for sleeping in; next, the adoption of a method of encamping which spread the army over a surface too great or too uneven to be reached; and next, the use of similar mechanics and chemists as the assailing force. Huxley would march with his fishermen to choke Tyndall with his Alpine climbers. War would then consist mainly of efforts to obtain advantageous positions, from which showers of death would be thrown, but war would not cease. Forlorn hopes would be organized among chemists or mechanics as easily as among soldiers, enormous rewards would be paid to the new warriors, and nations would fight each other as briskly as ever.

A WORD TO IDLE MINERS.—Miners and prospectors, anxious to do something for themselves, would show wisdom in giving Eureka district a fair trial before going off to other and distant parts. By many of those who have been lured off by glowing stories it is said that the equal of Eureka's properties are seldom seen. Especially it is said by these men that few camps offer as good opportunities to miners who want to work on their own account, or, for that matter, to miners anxious to work on any profitable layout, as Eureka. True, it is hard for miners to get work here on day's pay or for them to locate promising properties for themselves. But they can get good leases and tribute on the most favorable terms, and for whatever they strike a ready market awaits them at home. Is it not better to work a mine that is almost certain to contain good ore and get the greater part of its product than to experiment on a property, the value of which is very doubtful?—*Eureka Sentinel*.

MINING AND SCIENTIFIC PRESS.—One of the best mining and scientific papers in the world is "The Mining and Scientific Press," published by Dewey & Company at 252 Market street, San Francisco. It should have a large circulation among miners and among those who wish to keep posted as to the inventions of the age. The Press is reliable in every respect, and is conducted with ability.—*Foothill Tidings* (Nevada Co. Cal.).

USEFUL INFORMATION.

SWEET TOOTHED AMERICANS.—If, as some writers assert, the comfort in which the masses of a people live is measured by the quantity of sugar they consumed, our people rank high in the matter of good living. Our consumption of sugar is 56 pounds for every soul of the population. Only one nation shows a greater consumption, and that is England, with 67 pounds per capita. The quantity in France is 25 pounds, in Germany 18 pounds, Holland 153 pounds, Russia 5 pounds. The Germans, though large producers of (beet) sugar, consume only one third as much per capita as we. Another interesting fact is that we are steadily increasing our consumption per head. In 1867 it was 29 pounds, in 1884 it was 54 pounds, showing a nearly doubled consumption per head in 17 years. Our aggregate consumption of sugar (not including molasses and syrup) in 1884 was over 3,000,000,000 pounds, 2,437,000,000 pounds or four-fifths of which was imported, and 640,000,000 pounds produced at home. Of the home product 287,712,000 pounds was cane sugar from Louisiana, 14,000,000 pounds sugar from other States, 36,576,000 pounds maple sugar, 1,277,000 pounds beet sugar, chiefly from California; 726,000 pounds sorghum sugar, and 300,000,000 pounds glucose. It will be observed that our product of cane sugar is exceeded by our product of glucose, made from corn. Our sorghum crop makes a very small showing—about one per cent of the domestic product. Sorghum sugar shows better—30,000,000 gallons, which is double the crop of Louisiana molasses.—*St. Louis Republican*.

THE CARE OF CANARIES.—A correspondent of the *Germantown Telegraph* says: I frequently see inquiries about the care and raising of canary-birds. I have kept birds for the past 12 years and never had one sick or die, and I have raised a great many. Some think that a bird should never be fed anything but canary-seed. I have always given equal parts of canary and hemp. The first thing in the morning I give a piece of bread and fresh water, then roll the seed so as to crack the hard shell of the hemp. At noon I give fresh water, and often a piece of potato, either boiled or baked, and whenever I can a piece of apple. In summer I give lettuce, cabbage and wild pepper-grass, which last grows plentifully here by the roadside. They need clean sand occasionally, say once a week. Last spring I raised 20 birds from 2 pairs. When setting they need hard-boiled eggs in addition to their usual food, a half of one a day being sufficient for a pair, and when they are feeding the young birds roll the yolk of the egg, or chop very fine and mix with rolled cracker; you can also give plain tin pipes, in the season of them. An extra cage is useful, as they must be kept clean to be healthy. When setting they may be kept as quiet as possible, and in one place, as they will often leave the nest, if moved from where they usually hang, even to another side of the room. When six weeks old they may be removed from one cage to another without injury.

A CHAT ABOUT CAR WHEELS.—An official of the Pennsylvania Railroad states that there are fully 10,000,000 iron car wheels in use on American railroads. That figure does not include the wheels on palace coaches and the better class of passenger coaches. "How much iron does it take to make a wheel?" he was asked. "About 525 pounds of pig iron," he replied, "and about 1,250,000 wheels are worn out every year. But do not conclude from that the iron men are called upon to supply the 312,500 tons of material required to make the new wheels; because the worn out wheels themselves supply about 290,000 tons." "How long will a good car wheel last?" "Formerly it would last eight years. But now the reduction of railroads to a standard gauge and the improvement in loading and unloading facilities keep the length of service down. This is because the uniformity in gauge keeps the cars in more continuous use, and the improvements in loading and unloading facilities enable the cars to be put to more active service. The wheels on palace coaches and on first-class passenger coaches are known as paper wheels. They are made with a steel rim or flange, and iron hub, but the web is composed of sheets of paper cemented together. They combine lightness with strength."

PAPER SLIPPERS are the latest form in which paper is introduced. Mr. W. Litchfield, of new Broad street, London, has patented a system of manufacturing slippers, sandals and other coverings for the feet out of paper. In carrying out this invention paper, paper pulp, or papier-mache is employed for the upper, which is moulded to the desired form and size, and a sole is provided made of paper or paste-board, leather-board or other suitable paper material, which is united to the upper by means of cement, glue or other adhesive material. The upper is preferably creased, embossed or perforated at the instep and sides, or other parts thereof, so as to prevent the breaking or tearing of the same while in use. The sole may be made with or without a heel, and, if so desired, the slipper, or other foot covering may be provided with an internal lining of any suitable material.

CALIFORNIA AS AN OIL-PRODUCING COUNTRY.—California is now third on the list of petroleum-producing States of the United States. Pennsylvania leads, and New York is second. After

California come West Virginia, Ohio and Kentucky. A little oil is found in Colorado, Wyoming and New Mexico, although not much has been obtained in the latter places. California is gradually increasing her production, as new wells are opened in Southern California, and the industry is now a prosperous one there. As far back as 1878, 15,227 barrels were produced. In 1879 this increased to 19,858 barrels; 1880 showed returns of 42,399 barrels; 50,000 barrels in 1881, and 70,000 in 1882. The year 1883 showed an increase, and in 1884 the production was over 100,000 barrels. A barrel is uniformly 42 gallons. California consumes all the oil produced, and about 100,000 gallons per annum from the East as well.

GENIUS AND COMMON SENSE.—Genius generally makes the world catch its breath with admiration at its exalted flight, but it frequently goes to bed without its supper, takes a slice of hope for breakfast, and tightens its belt for dinner, while plodding common sense gropes along with its eyes to the ground, and by hard knocks and close picking gets three meals a day.

A WASH FOR OLD PAINTED WOODWORK.—Two ounces of soda dissolved in a quart of hot water will make a ready and useful solution for cleaning old painted work preparatory to repainting. This mixture, in the above proportion, should be applied when warm, and the woodwork afterward washed with water to remove all traces of soda.

A GOOD BROWN OAK STAIN is produced by preparing the wood with a solution of one ounce of catechu, boiled with one and a half pints of water. When dry, brush over a solution of bicarbonate of potash, one ounce to one and a half pints of water.

MARINE ANIMALS congregate mainly along the coast of continents on soundings. The meeting place of two maritime currents of different temperatures, as on the banks of Newfoundland, favors the development of a good diversity of fishes.

IMPORTANT ENTERPRISE.—An Eastern syndicate is looking for 25,000 acres of land in California, for the purpose of growing sugar cane and sorghum. A Georgia planter, backed by large capital, is at the head of the enterprise.

A SWIFT FLOWING RIVER.—The Sutlej, one of the greatest streams of British India, is probably the swiftest large river in the world. It has a descent of 10,000 feet in 180 miles, an average of about sixty-seven feet per mile.

CEMENT FOR PETROLEUM CISTERNS.—A useful cement, which hardens very quickly, is formed of litharge mixed with glycerine. It may be used for water and steam pipes, as well as for lining cisterns for petroleum oils.

A REMARKABLE BEDSTEAD, made to order by a Milwaukee furniture firm, is twenty four feet wide, and has nine compartments, each intended to hold one of the purchaser's children.

THE DIVINING ROD, sometimes used by well diggers, and at an early date by oil prospectors, is a popular fiction that dates back to the eleventh century.

GOOD MEALTH.

Fresh Air and Ventilation.

The question naturally occurs, what rule can we have so as to know that we get enough fresh air and not too much? The general principle is simpler than its application. It is this:

The average amount of air breathed by every person is about 24 cubic inches at each breath, with about 20 respirations a minute. This would be a cubic foot in three and a half minutes, or 400 cubic feet in 24 hours, or the contents of a room seven feet square and eight feet high. But this is only a fiftieth part of what every healthy person needs, for breathing vitiates the air rapidly, because the air exhaled has 100 times as much carbonic acid gas as the atmosphere, while twice the amount contained in the atmosphere, or eight parts in 10,000, is as large a proportion as can be breathed without injury to the health. Crowded rooms in winter, schools, etc., are sometimes found to contain three or four times as much, and headaches, and other ailments are the consequences of breathing the same air over and over again.

There should, therefore, be enough fresh air for every person daily to amount to 20,000 cubic feet, or enough to fill 18 rooms 10 feet square and 10 feet high. This would be amply supplied by an opening, tube, or orifice three inches square, with a moderate current. In the day-time there is usually enough air introduced into rooms through opening doors, cracks in window casing and in other ways. The chief danger is in sleeping rooms, where pains should be taken to have a circulation. When the room is warm, the air outdoors is quite cold, constant, and often sufficient currents are caused. A hundred persons should have a ventilating orifice equal to two and a half feet square.

RIDING UP STEEP GRADES, as in mountain railways, or ascending high mountains where the ascent from the sea level is rapid, often produces a very unpleasant and sometimes fatal

sickness. This sickness is known to the medical faculty as "sirocco," and very often sends people to bed for several weeks. The symptoms are a terrible pressure upon the temples, nausea, bleeding at the nose and ears and faintness, but the effects can be avoided by taking precautions and observing rules that experience has suggested, the chief one being to drink a glass of brandy and keep perfectly quiet, as the slightest degree of exercise will floor the strongest man. These effects are very frequently observed, and often with very serious effects in the ascent of the mountain railroad of Peru. People who are compelled to make the ascent of the road to the Cerro del Pasco mine, if they have not become accustomed to it, usually take two or three days for the journey, stopping off at the stations along the line, and going to bed at once upon reaching the town of Chicla, which stands at the summit.

SANITARY SCIENCE is of quite recent origin; so late, indeed, that the men who formulated it are still young. Its proposition to prevent disease by removing the conditions that provoked disease, merits the popular approval, and legislation has been quick to help sanitarians put their science to the test. With plenty of money, and in fair localities, it is not difficult to satisfy all the demands of the sanitarians. It will, however, hardly be contended that the sanitarians have formulated insurance against the outbreak of the zymotic diseases for the ordinary householder in any locality where necessity has placed him. And yet this is the very problem which sanitary science is to solve. Much can be done in one home to make it healthful; but the influences that affect one home are so intermixed with the influences that affect large areas, that State and national interference is demanded by sanitary science. Householders should take more pains to inform themselves in regard to the principles of sanitary science, so that they may be able to critically examine their own homes, and influence opinion, so that healthful conditions may be made compulsory under the law. This is good work, and the more of it the better. There is an immense chasm between crazy-quilts and sewer-pipes, sonatas and bad drainage; but it can be bridged by informing the women, and teaching the girls. If rosy children and long-lived husbands are worth the while, this education in what constitutes a healthy home is worth a place in the school curriculum for girls.

MIND AND DISEASE.—The influence of the mind upon the body, for sickness or health, is beyond all estimation. For a person to think he has a disease will often produce that disease. This we see effected when the mind is intensely concentrated upon the disease of another. It is found in hospitals that surgeons and physicians who make a specialty of a certain disease are liable to contract it themselves, and mental power is so great that sometimes people die of diseases which they only have in imagination. Well persons, to remain well, should remain cheerful and happy, and sick persons should have their attention drawn as much as possible from themselves. It is by their faith men are saved, and it is by their faith men die. If he will not die he can often live in spite of disease; and if he have little attachment for life, he may slip away as easily as a child will fall asleep.

SLEEPLESSNESS.—Those troubled with sleeplessness are invited by a writer in the *New York Mail and Express* to try the following remedy. It is based upon the theory that sleep is prevented by an excess of blood in the brain and may be induced by drawing it to other parts of the body: "Having assumed the usual posture of repose, inhale and exhale slowly and steadily long breaths, devoting the whole attention to making the inhalations of exactly the same length. The length should be much greater than that of ordinary breathing, although not sufficient to disturb the circulation by working the lungs to their utmost capacity. Any person who has force of will enough to concentrate his whole attention on the maintenance of this style of breathing can compel sleep in very unfavorable circumstances."

HOW TO TAKE A PILL.—The *Medical Reporter* gives the following directions: Place one or more pills under the tongue, then take a mouthful of water or other liquid and swallow (just as in the act of drinking); this done, look for the pill. Invariably the "I-can't-take-a-pill" patient is astonished, and sometimes he investigates the mouth with his finger to reassure himself if he has really swallowed the pill. The secret lies in the fact that in the act of drinking the tongue curves back upon itself; the pill, taken by the force of the current, is imperceptibly washed down the esophagus.

MILK.—Milk when swallowed rapidly by the glassful is very unwholesome. A quantity entering the stomach at once is changed from a fluid by the acid juices of that organ into a hard, cheesy curd, through which the gastric juices cannot pass; it is turned over and over, and as its surface can only be reached, it digests very slowly. It is sometimes fatal to a weak stomach. It should be taken slowly, eaten with something else, or sipped by the spoonful.

BEER FROM BANANAS.—Missionaries in the equatorial lake region of Africa have discovered that a kind of beer made of bananas is a prophylactic against malaria fevers, and that this drink is indispensable to their health.

MINING SUMMARY.

The following is mostly condensed from journals published in the interior, in proximity to the mines mentioned.

CALIFORNIA.

Amador.

SOUTH SPRING HILL.—*Ledger*, Aug. 22: On Monday last the drift at the 700-foot level encountered the ledge. The ore at this depth, so far as explored, is of splendid quality—equal in fact to any heretofore met with. The dimensions of the ledge are not known yet. Lumber is arriving on the ground for the additional ten-stamps to the mill. It is being hauled direct to Tarr's mill. Knight & Co., the contractors, expect to have the extra ten-stamps in running order within 60 days.

MISCELLANEOUS.—A number of men have been at work the past week cutting a ditch for the pipe to carry water from the Zeile reservoir to the mill. The new pipe is 15 inches in diameter, and there is 1100 feet of it to be laid. At the reservoir the embankment is being raised, so as to enable the water to be raised one foot higher—in fact, bring the water to the level of the ditch. At the Amador Queen operations are at a standstill, owing to lack of water. This is very unfortunate for the owners, who have gone to great expense in putting up a thoroughly equipped mill of 20-stamps, only to find the same useless until the rainy season sets in. At the mine everything looks promising. The ore body is said to be large enough to warrant the construction of a 60-stamp mill, and that fifteen men would be sufficient to keep a mill of that capacity running steadily. The Tellurium near Pine Grove is to be known hereafter as the San Joaquin mine. George Parker is the foreman. Only three or four men are at work at present, but a full force will be employed as soon as the ruins of the old shaft can be cleaned out. A New York company has commenced operations on George White's quartz claim, north east of Jackson.

SCANT WATER.—*Amador Sentinel*, Aug. 22: Scarcity of water has caused the closing down of several mines in the county. The hot weather causes the water to evaporate in the canal before it reaches the mines. A good prospect has been developed at the Quinn mine, Middle Bar district. The shaft is down fifty feet, with a large ledge in sight showing plenty of good sulphurets. Lack of water prevents any crushing of the rock.

Calaveras.

GRAVEL.—*At. Echo*, Aug. 22: It is currently reported that rich gravel has been struck in the Jack Rabbit mine. A rich strike was recently made in a quartz mine owned by J. J. Rapp, at Robinson's Ferry, known as "Our Flag" mine. Several thousand dollars have already been extracted.

Inyo.

PANAMINT.—*Inyo Reporter*, Aug. 22: The unsettled questions of title, etc., affecting properties at Panamint ever since the destruction of the big mill there some two years ago, and which in the meantime, has quite closed the camp down, have finally been effectually and satisfactorily settled, and now very soon again Surprise canyon will be almost as busy with life as during its flush days. Superintendent N. G. Fairman started a few days ago to the bay to purchase lumber, machinery, and everything for a complete new 10-stamp silver mill. The plant will include all the latest appliances for successfully handling base ores, and will include a first-class roaster and concentrating machinery. The work, we are assured on credible authority, will be pushed along just as rapidly as possible. The property is now all in the hands of the Inyo Consolidated M. & Mr. Co., of New York. Knowing something of that camp as we do, we are perfectly satisfied this enterprise will be a success.

MAMMOTH.—The Lisbon, as the new 5-stamp mill at Mammoth is called, started on its initial run some ten days ago.

HAWLEY MINE.—*Inyo Independent*, Aug. 22: From Cerro Gordo there comes reports that in the Hawley mine there are unmistakable evidences that one of the great ore bodies for which the district was noted in former times is about to be struck. In fact it is said that the ore has already been reached. The report is given for what it is worth. No one doubts, however, that if a large ore body has not already been found, it will be in a few days. The tunnel is now in ground the character of which is well known.

ORE SHIPMENTS.—This week about 80 tons of ore belonging to T. Boland were shipped from the Union mine at Cerro Gordo. Bob Locket and his partners shipped 20 tons from the lower levels of the same mine.

Mariposa.

COULTERVILLE ITEMS.—*Mariposa Herald*, Aug. 22: The Banderita mine has shut down for two weeks, in order that the miners may have a vacation. Some of them have gone to different portions of the county to visit their families, while others are spending the time in Coulterville. The Reed brothers have struck a very rich mine about three miles above the Banderita, on the north fork of the Merced. The vein is about two feet in thickness and pays from 25 cents to 50 cents a pan. They have sunk a shaft to the water level, twenty feet, and the vein looks better than it did at the top. The find is considered very valuable. The Hasloe mine is producing plenty of rich rock, and the new mill is reported as a success. The Red Cloud people have just finished sinking a 100-foot shaft, and much to their surprise a very rich vein was found at the bottom. They expected to have to drift to find the pay rock. The superintendent, Mr. Gaines, is in the city.

Mono.

MILL CREEK.—*Boodie Press*, Aug. 19: Jas. McDonald, of the Bryant mine at Lundy, was in town to-day, with a shipment of bullion from the last clean-out of the mill, which closed down on the 17th after a fine run on rich ore. Mr. McDonald says that only enough milling is being done to pay current expenses of developing the mine, which is being opened by a new tunnel running on the ledge and now in 100 feet. In a distance of 450 feet, while the ore extracted pays for running it, the ledge will be opened by the tunnel 300 feet below the old works, thus leaving vast stoping ground. The Butterfield mill started up yesterday on very high grade ore from the Jackson mine, under the superintendency of R. T. Pierce, who arrived there on the 15th. The

last lot of only 21 tons yielded \$1,200. The Little Enma mine has some 25 tons of rich ore waiting reduction at the same works. The Condon brothers yesterday commenced packing a lot of 15 tons from Golden Trench mine to Ashe's arrastra. The Gorilla mill continues to run in full blast. The real prosperity of the Mill Creek country is due to the fact that the boys have gone ahead independently to work gold mines that pay from the croppings down, a matter in which they have been materially assisted by the reduction from \$12.50 to \$5 per ton for crushing, at the Butterfield mill. Hence the actual output of gold is greater than ever before, and the mine owners do not care a continental whether the much mooted May Lundy sale ever transpires or not.

Nevada.

PROBABLY A SALE.—*Grass Valley Union*, Aug. 22: The late rumors in regard to the sale of the old Allison Ranch mine (at one time the great quartz mine of this district) are beginning to take shape, and it is now stated that a company of French capitalists, at present visiting the State, have contracted to take it at a given price and date, with the intention of starting up operations at an early day. It has been known for some time that negotiations have been going on, and it is reported that this is the outcome of the same. Of all the idle mining properties in this district there is none that stands higher in local favor than the Allison Ranch, which it is confidently believed is yet a mine of great value.

LONE TREE MINE.—*Foothill Tidings*, Aug. 21: The Lone Tree mining claim is now being thrifly and energetically worked by a company of gentlemen from San Jose and Gilroy, the work being principally done under the direction of Mr. Sevenoaks. The Lone Tree was worked to some extent several years ago, and some very rich ore was taken from the ledge. The mine for several years has been idle and the tunnel caved. A few leading spirits in the town who always had faith in the Lone Tree, have kept up their interests and have from time to time done such work upon the ledge as their means would allow. The tunnel is now almost entirely cleaned out and refitted, and last week the miners cut two large quartz stringers that are making direct toward the main ledge, which the miners say they will reach in a short time. Rock from these stringers, or ledges as they might be called, for they are from three to five inches thick, prospects well. We have seen the result of some pounded pieces, and it showed well in sulphurets of the very best sort, while all through it were plainly seen, with the eye alone, large, coarse colors of gold. The rock from these small ledges, that is the portion of them that has been taken up by the miners, will, every bit of it, prospect amply well, and many of the pieces that have been brought to town plainly show free gold. The prospects of the Lone Tree are just now very encouraging, and the two very rich stringers just cut surely extend to the main ledge, and will help to enrich that body of ore. The Lone Tree is located in one of the richest portions of our mining localities, and is surrounded by rich quartz ledges, each of them whenever tested have never failed to give up their shining treasures in a generous quantity. It will be but a little time now until the company will have their tunnel in working shape, and then they will start rapid work for the main ledge that is known to exist not more than 200 feet from where the miners are now working.

WATER PROJECT REVIVED.—Some time since the *Tidings* announced that the Empire company had abandoned the project of introducing water power into the Empire mine. The project was abandoned, owing to the fact that amicable arrangements could not be made with parties owning land along the proposed line of pipe. Through the energetic efforts of Mr. Wm. B. Bourn, these difficulties, that is most of them, have been overcome, and now the Empire company, through Mr. Bourn and some more of the principal owners, are busily engaged in forming a company in San Francisco, for the purpose of carrying out the original water scheme, which will be of incalculable value to that section of our mining district lying south of Grass Valley.

Shasta.

A BOOM.—*Shasta Co. Democrat*, Aug. 19: Mining interests are experiencing a decided boom at the present writing. The mountains are alive with hard-working prospectors seeking hidden fortunes. The Copper City quartz mill was started up again with additional smelting furnaces. Success is assured. The sale of the Lost Confidence mine is not yet publicly confirmed, but the general supposition is that it will be. Whitton & Small are building a large arrastra on their Squaw Creek claim. They have several tons of rock on the dump out of which they make wages milling in a hand mortar. The mill on the Harrison mine is being put in place rapidly, and will be hammering away by the first of next month. Sixteen men are employed about the mill and mine. Dan O'Neal has started a tunnel that will tap the Florida 175 feet deep. The tunnel will be about 350 feet in length. On account of the scarcity of water he can run his mill only six hours a day. Jack Conant came down from Squaw Creek Monday, and showed us some gold quartz specimens from his Squaw Creek mines, also a handsome chunk of bullion he pounded out in a hand-mortar. Workmen were set to work last Monday excavating for a mill-site for the reduction works to be put up on the Scheerer mine by Robinson. The works will be located within a few yards of the mine. The discovery recently made on Slickrock creek in Flat creek district, by Fred TenEick and Jim Magoon is said to be one of the best prospects found in the county for many years. The whole vein shows free gold and much of the rock will pay good wages in milling it in a hand mortar. It is confined between walls of porphyry and granite, and ought to be a contact fissure vein. It courses nearly east and west. Messrs. Titus & Grant in Bullychoop district, have struck the ledge in the Central mine 5 feet in width, and will average \$20 rock. Part of their Huntington mill has arrived at the end of the wagon-road, and a sled-road is being built that it may be taken to their mill-site. Davis Bros. have struck the lode in their tunnel on the Pound Cake mine, and it looks remarkably well. The Hoskin Bros. continue to extract good ore from the Little Gem. Bullychoop is just now getting into shape to show what it really is.

Sierra.

PRIMROSE.—*Mountain Messenger*, Aug. 20: P. A. Lamping was in town last week. He has organized a company in Oakland to open and develop the

Primrose mine, in Hog canyon. The first work done will be to clean out the shaft which was filled up several years ago while running an upper tunnel. The old tunnel from the bottom of the shaft to the ledge will be opened and the ledge developed. On account of the several dry seasons, this is a favorable time for this work. So far as worked the Primrose ledge was very rich, and it is probable that when properly developed, it can hardly fail to pay handsome profits.

San Diego.

JULIAN DISTRICT.—*San Diego Union*, Aug. 20: Mr. W. R. Defrees, who in 1872 and later was one of our citizens, and actively engaged in mining operations in the Julian district, has been paying a visit to his old stamping ground. He has been conducting some important mining enterprises since we last saw him. We are glad to hear him say that his early faith in the permanent value of our San Diego mining section is as strong as ever. After visiting Julian and vicinity he has returned here to take the train to New York on Saturday morning. He will come back to San Diego in four or five weeks, and will proceed to Julian, where he will reopen the old Owens mine, as well as the Washington mine. The Owens mine has been lying idle for over ten years; and yet when Mr. Defrees had charge of it, it always paid handsomely. He expects to make it pay again. Mr. Defrees thinks, also, that the Washington, the first discovery at Julian, can be made to pay—in fact, he is sure of it. He regards the mining section of our county as very important, and speaks in high terms of the Stonewall, Shenandoah and other mines. The *Union* has always firmly believed that the gold quartz mines of this county were a permanent source of wealth, and we take satisfaction in placing on record, in confirmation of our belief, the opinion of one of the most experienced and able mining experts in the country.

San Bernardino.

CALICO MINING DISTRICT.—*Print*, Aug. 22: Since our last general report, the mines that we heretofore made mention of, are working with their usual force and vigor, and producing the usual output of bullion. We have in the meantime examined most thoroughly the Kearsage owned by Robert McCullough and E. E. Stacy. A shaft has been sunk at the depth of 40 or 50 feet. A tunnel has been run, connecting with the shaft. The vein is of an average width of say two feet, upon an ore body or chimney which is without a doubt upon the same great ore body as that of the Silver Odessa, as the trend of the ore of that mine. The owners have for a long time past been working, and that with success, upon this mine. The Kearsage is without doubt one of the finest properties now held in private hands in this district, and is being worked with energy by the present holders, not so much with a view of sale as that of benefit to themselves. The mine is undoubtedly on the great fissure of the Silver Odessa, and is a true vein with well defined walls, with every and all indications of being a genuine and true fissure.

THE CLEVELAND.—This mine lies between Calico and the Fish Ponds and is now under bond to Hugh Stevens, who has but recently returned from an extended tour through New Mexico, Colorado, etc. The vein is encased between lime and porphyry, is carbonate of lead. A shaft has been sunk upon the vein to a depth of 30 feet. At this depth the ledge was crosscut, and 12 feet in width, in solid carbonates of lead, carrying from \$20 to \$30 per ton in silver. The vein is within less than four miles of the railroad and of easy access thereto.

PLUTARCH.—Since our last report upon this mine work under the direction of John McBride, the principal owner, has been advanced in different parts of the mine, notably in shaft No. 7, which has now obtained a depth of 70 feet, with a well defined foot-wall and a fine showing of high grade ore. The ores of this mine have uniformly paid well. The vein is directly upon the great ore channel or mineral zone which runs as courses or cuts the formation from north to south. That is upon the Bismarck and Silver Odessa belt, which lies north of the King and Sue belt.

KING.—Work is progressing upon this mine as usual, some 80 or 90 men are employed in and about the mine. We shall visit the mine and inspect it and report more thoroughly in our next issue. This much we will say now. The mine is producing the average monthly output of bullion. And all the crosscuts and levels are looking well, we will visit sometime during the coming week by invitation of D. Bahten, superintendent, and will then make a complete review of the workings of the mine.

THE WATERLOO.—We have been informed and have no reason to doubt the same, that developments of importance have recently been made in this mine, which belongs to the Oro Grande Co.

ALHAMBRA AND GOLCONDA.—The Golconda Mining Co., of San Francisco are operating in a small way on one of their claims, the Alhambra. Two tunnels are being run in from the south side of and half way down the hill for the purpose of opening up what is thought to be a rich ledge in the center. No developments of consequence have been made in the tunnels which are in a few yards. The best indications are in the cuts above on the surface, all of which show ore, principally of a good milling grade and occasionally streaks and bunches of ore that assay up in the hundreds of dollars. The present work which is done by several men, is intended as prospecting, and is under the careful and judicious management of G. W. Rogers. Strong hopes are entertained that large bodies of fine ore will be opened up and that the mine will develop into a valuable one. On a small portion of this mine N. E. Cline and nephew have a lease and they are taking out some fine ore in small quantities, the profitability of which will be determined after milling. Nothing is being done on the Golconda at present. The 60-foot incline shaft and the large chambers at the head of the same show over a great portion of the walls, and give ample encouragement for future developments.

Tuolumne.

RUNNING.—*Cor. Tuolumne Independent*, Aug. 22: The Dead Horse mine is running at full blast. They are busily engaged in sinking the shaft deeper. This is acknowledged to be one of the best mines in the county, and we earnestly hope that the company in charge will meet with brilliant success. Machinery has recently been shipped from San Francisco, to be placed on the Morning Star mine, near Chero-

kee. This mine has been in active operation for some time past, with flattering prospects. The Charlotte mine has started with a small force. This mine is considered to be very valuable, but unfortunately, it has been in continual wrangle for the past year, caused by several different parties claiming it. However, we hope that it is at last settled sufficiently to permit the rightful owners to go ahead and work it unmolested. Mr. Lucas, of Sonora, is engaged in opening the tunnel on the Lady Washington mine, near Summerville. Mr. Lucas informs us that as soon as it is opened for exhibition the property will be sold. A mining expert came up to examine the Hunter mine on Saturday last. There are several other mines in this neighborhood in active operation.

TURNED THE RIVER.—*McQuade, Fitch & Co.* are rushing work on their claim, on the Stanislaus, near Reynolds' Ferry. They have turned the river by a dam, leaving one-half a mile of the bed dry. The dam is constructed by driving stakes and filling back by sacks of sand. The cut is across an elbow of the river, into which the stream is turned. The gravel will be raised from the old bed of the river by steam power, and the machinery arrived upon the ground this week. The derricks and other apparatus are in place and mining will commence at once. Fourteen men are employed, several of whom are also interested in the mine. It is a Sonora enterprise, and the supplies are obtained here, and the proceeds will also be invested here. The claim will doubtless prove a profitable one to the enterprising owners.

NEVADA.

Washoe District.

HALE AND NORCROSS.—*Enterprise*, Aug. 22: The deep winze is now 137 feet below the 3000 level, with the bottom still in strongly mineralized vein matter with ore giving good assays. Sinking is being continued deeper for a pump, it now being below the 3100 level, and in a day or two, or about the first of the week a station is to be opened at that level for a drift southeast to connect with the drift from the Combination shaft. All work will be concentrated upon this drift, as in sinking the winze deeper this will be the shortest cut to the shaft to run out ore, waste, etc. The entire distance is about 130 feet, and the other end of the drift, at the Combination shaft, is already commenced, the chambering out of the station being in active progress. From the shaft the drift will be run due west for 100 feet, when a turn will be made to the right, and the drift run in a northwesterly course to meet the drift from the winze. At the point where this drift turns, 100 feet from the shaft, a drift is to be started southwest from the Chollar ground. Both these drifts, and especially the one for the Hale and Norcross, will pass through very interesting ground, and somewhat demonstrate the bonanza value of the east portion of the Hale and Norcross ore vein.

YELLOW JACKET.—Work was actively resumed in this mine Thursday night with a full complement of men, 150 being employed, twenty-five more than before work was suspended in order to arrange for running the Brunswick mill by steam as well as water power. This arrangement being completed sooner by several days than was anticipated, the mill started into full operation Thursday morning on Yellow Jacket ore, there being a good supply at the dumps of both the mill and the mine. Water will furnish about one-third of the motive-power, and the crushing capacity is increased to 210 tons each twenty-four hours. The mine is also in better shape for extraction, and more men will be put to work as may be required. The main incline has been put in a complete state of repair from the 1100 down to the 1300 level, and made available for ore extraction. The Imperial incline has also been cleared out and repaired at a point above the 1500 level where it was caved, and is now utilized for ventilating the 1300 level of the Jacket, a good circulation of air now passing through the Jacket incline.

CHOLLAR.—The main drift west, now being opened on the 3100 level, from the Combination shaft will be advanced 100 feet west from the shaft, and from that point it will branch each way in the form of a Y, one branch going northwest to the Hale and Norcross, and the other southwest to the Chollar. This lower drift into the Chollar will be more advantageous in the way of exploration than the present 3000 level which has been considerably explored already. The new section of the hydraulic pump in the Combination shaft has, since it started into practical operation last Saturday, been working as smoothly and effectively as could well be desired. The big pump is now complete and able to contend against a whole river of water.

CROWN POINT.—This mine and the Belcher are both shut down for the present. The Crown Point machinery is being overhauled and put in complete order for an effective run when work shall start up again. The mills which have run on ore from these mines are also being overhauled and put in order. These are the Mexican, Santiago and Eureka, all water mills which the Carson river is too low to furnish motive power for at present. The flume of the Mexican mill, having become old and dilapidated, is being reconstructed in a substantial manner throughout.

CON. CALIFORNIA AND VIRGINIA.—From the Jones lease section about fifty tons of ore per day are being extracted, which, according to battery samples at the Eureka mill, assays a little over \$15 per ton. The 1750 level, worked on company account, yields about 140 tons per day, assaying \$22 per ton. On the 1600 level a drift is being run to the northwest for ventilation and prospecting purposes.

BES. AND BELCHER.—Crosscut No. 2, west, on the 1000 level has been extended 44 feet during the week, making a total distance of 50 feet. The face is in clay and vein porphyry, with no ore indications as yet. This crosscut is about 200 feet south of the Consolidated Virginia line and 100 feet south of crosscut No. 1, in which operations have been suspended.

SIERRA NEVADA.—The crosscut west from the main north lateral drift on the 520 level has been extended 50 feet during the week, making a total length of 90 feet. Material, dry, hard, vein porphyry, which grows softer in the face of the drift,

ALTA.—The station chamber of the drift west, on the 700 level, is being enlarged and put in substantial order for an advance westward into the merits of the ore-body prospect, developed by the upraise above the 500 level.

KENTUCK.—Enough ore is being extracted to supply the Rock Point mill, which, from lack of water in the Carson river, is now only running to about one-third of its capacity.

GOULD AND CURRY.—On the 1000 level west crosscut No. 1 has been advanced 48 feet, making a total length of 201 feet. Material in the face clay and vein porphyry.

OPHIR.—The upraise from the 500-foot level has been completed to its connection with the old Mexican shaft, which is now being cleaned out and repaired.

Eureka District.

AN ENCOURAGING FIND.—*Sentinel*, Aug. 22: It affords the *Sentinel* great pleasure to chronicle an important development in the Ruby Hill Tunnel. It is the most encouraging thing that has transpired in this district in a long time. Eureka is not yet played out. We have always had unbounded faith in the deep bowels of old Prospect mountain. The strike is especially important from its great depth. It will be remembered that General Connor had a line body of ore in the Eureka tunnel. That body in its day was at the deepest point reached in the mountain. The Ruby Hill tunnel is 700 feet lower than the Eureka tunnel, and 200 feet lower than the Prospect Mountain tunnel. The samples brought down yesterday from the new find are as fine as silk. We never saw finer looking ore in the camp. The assays and other particulars are given elsewhere in to-day's *Sentinel*. The samples are on exhibition at the Jackson House. If the discovery continues to improve for a few days as it has in the last 24 hours, the Ruby Hill tunnel will have a paying bonanza. The company is incorporated and has a magnificent scope of territory. The original owners did the sensible thing in the beginning of consolidating a number of claims, some 20 odd, and taking stock in the tunnel company. The owners were feeling particularly jubilant last night. The stock made a big jump in the confidence of the holders on the strength of the strike. All of the shares are owned by Eureka people.

ARIZONA.

MINING IN MOHAVE.—*Miner*, Aug. 20: Chlorides are all doing well throughout the county. If John Barry makes a success of his new smelter at Cerbat, lead claims in that vicinity will become valuable. John K. Mackenzie is taking out some good ore at the Cubel mine, and is likely to do well out of his lease. J. M. Gale has struck another good body of ore on the Moonbeam mine, at Stockton Hill. George Mendez made a shipment of ten tons of ore from his claim near Chloride, through Beecher & Co. Messrs. Smith & Co., of the Golconda mine, made another 12-ton shipment last week. This mine is now putting out about fifty tons of ore per month, the result of the work of four men. Most of the ore comes from the seventy-foot level where the ore body is two feet wide, averaging 42 ounces in silver, \$15 in gold and 30 per cent in lead. The Golconda is rapidly coming to the front as one of the best paying mines in Mohave county. The next thing the miners in this district have to look forward to is the Cerbat smelter. We understand that Mr. Barry has made all the arrangements necessary to have a smelter running at Cerbat in a very few weeks, and that he has already commenced shipping in the necessary material. A carload of lumber and two carloads of coke are already at Kingman for him, so we are informed. Mr. Barry is an old resident of this district and a man of much energy and perseverance, and we wish him every success in his new venture. Mr. John Barry, who is now in charge of the mines and mill of the Arizona Northern Mining Company, has commenced work on the Cerbat mine, and now has some six or eight men taking out ore. His main efforts will, however, be directed to the Connor mine, on which he now has a force of men at work, cleaning out the shafts and drifts. The Connor is a good mine, and Mr. Barry knows it, and has faith in its future. The men who are working on the Hibernia mine in Cedar district for Henry Raymond, have struck a fine body of ore which assays away up in the hundreds. Capt. Hardy has been obliged to quit work temporarily on the Indian Boy tunnel on account of the heat and consequent bad air. The work of driving in this tunnel will be continued as soon as cooler weather sets in. Mr. Hardy tells us that Johnnie Mackenzie struck fourteen inches of rich ore in a place on the Cupel ground, hitherto supposed to be barren. Mr. Potter, of the Pueblo smelting works, is making the rounds of the district for the purpose of securing ore for his company. He is offering rates for lead ores which run from \$15.50 to \$18 per ton for freight and treatment, and from \$18 to \$25 for dry ores. He is offering forty to fifty cents a unit for lead, and promises still better rates if the railroad company can be induced to lower their freight rates. James Daggett made another shipment of about two tons from the Queen Bee mine last week. Ore from this claim nets him about \$65 per ton at Kingman. An expert from New York, whose name we did not learn, was at Stockton Hill last week examining the Moonbeam and other properties owned by J. M. Gale. Aistrop & Co. made a shipment from the C. O. D. mine to the Kingman sampling work which turned out favorably. Rube Wright and Harley Fay are taking out some fine ore from the Mariposa mine at Stockton. Taggart & Co. are making about 7 feet a week on their tunnel on the Little Chief mine, with only one man employed.

ARIZONA QUEEN.—*Prescott Courier*, Aug. 24: The Clark family, of New Haven, Conn., who held the greater part of the stock of the Arizona Queen Mining Company (Chicago and other mines on Groom creek) will resume operations there before long. As a preliminary, they have secured the consent of the stockholders to a mortgage of fifty thousand dollars to cover the advances they propose making and those already made. It will be a sincere satisfaction when the company's mill, which has been so long idle, commences work again. The stampede for Pine Flat still continues, a considerable number of our citizens having started, yesterday, to take up locations as near as they can to the recent horn silver strike. An area of several square miles in that vicinity will be fully mortgaged before the

week is out. If only one out of every ten of the locations so made, is honestly prospected, there will be work enough on hand to keep our idle miners busy for the balance of the year. John Holmes, a successful miner of Turkey Creek district, who recently went to Pueblo with a shipment of ore, has returned home. He was accompanied by Captain Brand, who goes out to Turkey creek to inspect certain mines and mills and, perhaps, work the same.

LOTS OF SILVER.—Great excitement in Turkey Creek. Shull & Austin's stage from Alexandra, reached Prescott last evening, with 450 pounds of silver bullion from the Tusconia mill, a big bar of bullion from the Peck, and cheering news from the new and rich silver discovery in Turkey Creek district. This news is that, yesterday Messrs. Morgan & Powell took \$2500 worth of silver out of their claim; that other claims were yielding nearly as well. The people are excited and the rich for claims is great.

COLORADO.

TALC DISCOVERIES.—*Tribune-Republican*, Aug. 20: Eagle county miners are just now appearing considerably exercised over their discoveries in quartzite. Porphyry and lime formation is taking a rest while quartzite is the rage. The character of the mineral is quite astonishing to the miners, as are the caves which are so frequently encountered. Further development will be watched with much interest to know how much dependence for permanency can be placed upon the new mining curiosities. The last issue of the *Shaft* shows how irregular specimens may be run in assay value and yet how this tale mills in carload lots. We understand that a sample taken from this by a well-known Leadville assayer returned only 21 ounces silver to the ton, while the tag on the specimen credits it with 760 ounces. On investigation we find that this assay was made by W. W. Huntington for a sample taken next to this block of tale as it was dug from the mine. All this mineral looks alike. The eye or touch can not distinguish the lean from the rich. It assays from 15 ounces silver and 2-10 of an ounce gold to over 1,000 in silver and 10 or 15 ounces in gold. This particular specimen was brought to Red Cliff to show the character and nature of the ore only. It was taken to Leadville by a Leadville man as a curiosity at his own suggestion. The owners were not interested, nor did they care what was done with it. A copy of the assay returns mentioned above, made by Mr. Huntington, was placed upon the specimen. There was no intention to deceive, and it is more than probable that other samples taken from this cube will return even higher figures than those with which it is labeled. But the proof of the pie is in the eating. Six cars of this tale ore have been shipped from the camp in the last two weeks that have netted from \$150 to \$220 to the ton. What more positive proof of the great value of the mineral from these quartzite mines can be had?

IDAHO.

BOISE BASIN.—*Idaho Statesman*, Aug. 20: Mr. J. A. Richardson, civil engineer, who has been spending a few weeks in the Boise Basin, engaged in surveying several mines for patent, has returned to Boise. From him we learn that several mines in that section are showing up exceptionally well. The Banner mine, after a seventeen days' run on ore taken from about 200 feet of tunnel and 150 feet of stope, netted \$41,000. The Morroe boys are developing the Silver Chief and are sinking a shaft and erecting hoisting works. K. P. Plowman made a good run on his placer claim which he worked ninety days, the product of his clean-up being \$28,000. The Gold Hill Company, at Quartzburg, have abandoned their old works and are developing their new property. They have thus far taken about \$100,000 out of the new vein, and are erecting new hoisting works. Their mill is not running at present but will start up again shortly. Ben Willson is doing good work with his elevators and his novel method of working his placers is giving the greatest satisfaction. The five-stamp quartz mill owned by Marion Waldron, the proprietor of the Golden Fleece mine, is idle, as the mine is not at present being worked. The quartz resources of the basin are gradually attracting more and more attention, and will eventually bring this camp to the front as one of the most permanent and productive in the Territory.

THE KETCHUM WORKS.—*Wood River Times*, Aug. 20: The two stacks of the Philadelphia Mining and Smelting Company, which have been idle for a few days, owing to the lack of flux, will be "blown in" again next Monday morning, for a campaign which may be protracted until February, the time of the annual cleaning-up. The company has just closed a contract with the Union Pacific Company by the terms of which it agrees to receive, at the depot at Ketchum, from now until the first of December, two carloads of coke and two carloads of iron ore per day, or four carloads altogether. It has also agreed to deliver to the company, for shipment to Omaha a minimum of two carloads (or 60,000 pounds) of lead bullion per day until the first of December. The contract being continuing, it may be extended after that date, from time to time, upon consent. The smelting company is receiving an average of 50 tons of ore per day, from certain fixed sources, besides miscellaneous lots from Lake Creek, Boulder, Galena and elsewhere, and there is no apprehension of the supply of ore failing. In fact, present appearances would almost justify the blowing-in of the third and fourth furnaces of the company, which have been idle the past two years.

THE LITTLE SMOKY PLACERS.—*Wood River Times*, Aug. 19: Al Arnold is in town to-day, from his Little Smoky claim. He has just made a clean-up and brought the result—20 ounces of gold—with him to be retorted. The gold is excellent. Besides being very fine, in value, a large percentage of it is nuggets, ranging in value from \$15 down. Mr. Arnold is confident his claim will yet make his fortune, and is satisfied with what has been accomplished thus far. He says all the placer land there has been located, and quite a number are working their claims this season, but with what result is not known. Most of the claims that were located this season are being worked. Some spots along the creek, he says, are very rich, while fair pay dirt is to be found all the way down the creek for a distance of 12 miles. A great future is no doubt in store for the gold belt.

MONTANA.

THE ALICE.—*Butte Miner*, Aug. 19: Everything around the Alice mine is bustle and enterprise. During the past week the new plunger has been connected with the main rod at the 800-foot level. This makes everything complete with the pumping machinery, and the big Cornish pump works more smoothly than it did with the "drawing lift." In consequence of making the necessary connection with the main rod, the pumping machinery was stopped and remained idle 48 hours last week, which caused the water to raise in the shaft 20 feet above the back of the 800-foot level. The water, however, will be all out of the mine on Monday morning and the work of running in the north and south crosscuts on the 800-foot level will be resumed. The daily ore output of the mine is as great as it has been at any time during the past two years, while the several stopes, drifts, raises, etc., show as much ore as was ever seen in the mine. The general appearance of the mine is as good as it ever was. The work of putting up the new galloways is going along very nicely. The big south-west hoist was put into place yesterday and is a mammoth affair. It weighs exactly five tons. When the new frames are in position the Alice hoisting works will be one of the finest and most elaborate in America. The big post was started up yesterday while our reporter was on the ground, and everything was found to work in a very satisfactory manner. The Alice 60-ton stamp mill was closed down two days last week for repairs, but is working in full blast again.

THE MAGNA CHARTA.—The main shaft of the Magna Charta is down to the 700-foot level and the work of cutting the station is being carried on with vigor. The general appearance of the mine is good. The stopes from the 700 to the 600-foot levels are producing the usual quantity of ore. The daily ore output can be materially increased if occasion should demand it. The Rising Star looks better than it ever did before, and is now added to the long list of paying mines of this camp. Fifteen tons of ore is the present daily output which will assay forty ounces to the ton. The stopes from the 700 to the 500-foot levels are all looking very good and an immense quantity of ore is in sight in the different places. Superintendent W. E. Hall has much faith in the future of the Rising Star mine.

AMY SILVERSMITH.—The courteous and genial Superintendent Lloyd, of the Amy Silver Smith mine, was found in his office, engaged in the pleasing work of paying off the sixty men employed by the company last month. Mr. Lloyd was in a pleasant state of mind, and informed our reporter that he was pleased to welcome the first newspaper man who ever visited the Amy Silver Smith. The new and commodious hoisting works is erected, and is found to be a well finished and complete building. The large amount of work in progress at this mine looks as though the management expected something big in the lower workings. A double hoisting engine has been purchased by the management and is now on its way here from the East, which, when it arrives will be put up with all possible dispatch. Then sinking the shaft below the 200-foot level will commence. The force of men at present engaged in the mine is prospecting. The Amy Silver Smith is in a good location and much is expected from it. We wish the mine and its worthy superintendent, Mr. Lloyd, unbounded prosperity.

GOLDSMITH NO. 1.—This mine is a very remarkable piece of property. The recent strike in the winze below the 150-foot level has improved greatly during the past week. When struck, the ledge was fifteen inches wide, but it has now widened out to two feet, and the ore being taken from it will assay in the neighborhood of \$700 to the ton. Miners are sinking on the ledge in the winze where it was first discovered, and also raising up on it from the 250-foot level. Present developments show that the ore body is a large and very valuable one. Twenty-five tons of ore from the new strike have been brought to the surface, and is now in sacks waiting to be shipped.

UNION CONSOLIDATED.—Prospecting is being actively carried on at these mines. The foundation for the new engine on Union No. 3 is being laid, the new machinery is on the ground, and everything around the mine indicates a determination on the part of the management to work the mine for "all there is in it."

MINER NOTES.—Everything at the Moulton is in first-class order. The usual quantity of ore is being taken out of the mine, and the general appearance of the property was never better.

THE KATIE PUTNAM.—*Helena Independent*, Aug. 20: Robert Whipple has just sold a quantity of ore from the above mine and contemplates the resumption of work next week. The Katie Putnam is, so far as developed, a rich and promising vein. It is situated south of Red Mountain.

STEMPLE DISTRICT.—The Great Grub Stake mine of Stemple district is producing its regular quota of bullion. The vein averages from ten inches to two feet in width and runs \$100 to the ton. There are now eight locations on this lead, aggregating 12,000 feet or two and a quarter miles. All these mines are producing good ore. It is the easiest lode in Montana to work, requiring no blasting whatever, the ore and walls being readily taken down with a pick. It is only thirty-five miles distant from the city and contributes no small amount toward promoting our welfare and prosperity. Extensive developments are going ahead, and before long the bullion output will be many times greater than it is now.

THE YELLOW BOY.—Next Monday Mr. Constans will start up the old Harvey mill in the Park upon quartz from the Yellow Boy lode. About 400 tons of free milling gold ore are now ready for the mill. The mine is situated near the head of Nelson gulch, west of the Park. It is said to present a fine appearance. Although the mill has been idle for some years, Mr. Dunphy, the present owner of the property, received word that nearly everything was in perfect order.

NEW SYNDICATE.—A rumor prevails upon the street that John Caplice has succeeded in forming a powerful company in New York to open up the Ten Mile mines, and that he will arrive in a few days, accompanied by a number of capitalists interested in the enterprise.

OREGON.

PLACER AND QUARTZ.—*Jacksonville Times*, Aug. 20: The Sterling Co.'s reservoir is assuming proportions. Reports from the Yank ledge continue of a flattering nature. J. C. Neuz and brother are at Galice creek prospecting their claims there. Priekett & Co., of Steamboat, are mining the Applegate with fair prospects. R. Cook was over from Steamboat yesterday. His tunnel is now 360 feet long. A great deal of prospecting is still being done in Jackson and Josephine counties. John Bolt says that a miner is engaged in crushing quartz on Applegate in a hand mortar and making \$1.50 a day. Thos. Berryman & Co., having finished their wing-dam in the Applegate, are working the bed of the river with good success. Mr. Sargent, while mining on Brush creek, in the Steamboat district, picked up one piece of gold worth \$25 and another worth \$7 Wednesday. J. C. Ruck and Mr. Wilson, an old Nevada miner, have discovered a fine large body of quartz in Willow Springs mining district, which promises very well. H. L. Hansen & Co. have opened a new mining claim near Waldo and will next season operate it. They think they have a small sized bonanza, and we hope they will not be disappointed. The new quartz mill will be here this fall, and will afford a good opportunity for those owning ledges to test their ore. This is an excellent inducement for a general prospecting of Jackson and Josephine counties. J. M. Walsh and H. T. Bragdon, of Ashland, have bonded and bought some quartz ledges on Wagner creek, and will immediately begin to develop them, a force of men having gone to work upon them last week. A mining expert has pronounced the rock as being very promising. Hon. Theo. Cameron informs us that A. D. McKee & Co. have struck good pay on Elliott creek. They recently took out one nugget of gold worth \$36 and some smaller ones. That is proving an excellent summer camp, there being too much snow and water in winter for expeditious mining.

PINE VALLEY MINES.—*Cor. Democratic Times*, Aug. 21: The Pine valley (Union county) mines are attracting much attention from the wide awake business men of the northeast corner of our state. I was at the new camps Saturday and Sunday, collecting samples from many of the mines. There are now over 300 mines claimed and located. Allen & Cox have just bought a one-fourth interest in four mines, paying \$10,000 for the same. O. born, Tartar & Denna have also invested \$10,000 for the Mountain Chief and an interest in several other mines. I also learn that Mr. Perkins, of Eagle valley, yesterday bought the interest of a lucky poor man in several mines he had discovered and located, paying \$10,000 for the lot. Those that pretend to know say that the discoverer sold for less than one-tenth of what his property was really worth. Miss Julia Coggins has an interest in upwards of forty good mines, and by the miners here is thought to be the wealthiest young lady in Oregon. It is said that this young lady while traveling in company with her father (or her health) up the east side of this wonderful Eagle mountain, discovered three rich gold mines, which ultimately led to the great Pine valley boom. None of the mines have been opened beyond a depth of five or six feet. While I was there two young men came into camp with very rich specimens, jubilant and happy over their good luck. Their find was about seven or eight miles north of Cornucopia. Wm. Harper has started a large arastra to work up the quartz, and a company has been organized to put up a twenty-stamp mill. There is an abundance of water and plenty of fall to it. All of Pine gulch for a distance of seven miles is already taken up in twenty-acre lots for placer mining. The only way of reaching these mines is by way of Sparta, Eagle valley and Pine valley. The mines, by a direct line, are only 25 or 30 miles northeast of Baker city. None of the placer mines have been opened yet.

UTAH.

SANDSTONE MINING NOTES.—*Southern Utah Times*, Aug. 20: Both mills have been running regularly on company ores, with usual results. Both companies are working a full force of men in the mines, and the output has been of the average grade and quality. Walter Seidentopf made a small shipment of ore from the old Leeds mine to the Stormont mill one day last week. The bullion shipment from the Reef, for the month of July, per Wells, Fargo & Co., aggregated \$29,218.08. A six-inch seam of ore was struck in A. Levy's mine on the East Reef during the week, a sample of which assayed 213 ounces silver per ton. Ed. Lochney is pushing things on the Bonanza. He brought in some fine specimens, taken from the property, and evidently thinks that he has the world by the arm. There appears to be bad blood between the owners of the Mountain Chief mine, a property of some prominence in the district west of St. George and there is likely to be litigation as the result. Ab. Polleys returned from a visit to the Iron country, where he went to look at a silver claim in which he is interested. He says that the quartz is very rich, there is plenty of it in sight on the surface, and if it will only go down he has as good a thing as he wants. Parties up from St. George report that the mines out in the Tutsaquit district are showing up big. A three-foot vein of fine galena was struck recently in the "Scorpion," which belongs to the Mountain Chief group of mines. The other mines of this company improve as work progresses and are looking exceedingly well. With lead, selling at the price it is at present, there is no reason why the smelter should not be turning out bullion on a paying basis. A little practical and energetic management would bring this property to the front at once.

REVIEW.—*Salt Lake Tribune*, Aug. 22: Ontario shipments for the week were forty-six bars of bullion, \$27,225.51, making the total output for the year to date \$972,752.34, from which seven dividends of \$75,000 each have been paid, and the eighth of the year will be paid the last of the present month. Silver Reef sent up during the week three silver bars, worth \$4,339, of which the Stormont sent two, \$2,930, and the Christy one, \$1,409. The Hannier has started up again, sending in on the 10th one car of bullion, \$2,430. The product of the Germania for the week was twelve bars refined silver, \$14,060.20, and fourteen cars bullion, \$37,127.28, a total of \$51,187.40.

HERCULES SLAYING THE GIANTS.

HERCULES POWDER

Derives its name from HERCULES, the most famous hero of Greek Mythology, who was gifted with superhuman strength. On one occasion he slew several giants who opposed him, and with one blow of his club broke a high mountain from summit to base.

HERCULES POWDER will break more rock, is stronger, safer and better than any other Explosive in use, and is the only Nitro-Glycerine Powder chemically compounded to neutralize the poisonous fumes, notwithstanding bombastic and pretentious claims by others.

No. 1 (XX) is the Strongest Explosive Known.

No. 2 is superior to any powder of that grade.

PATENTED IN THE UNITED STATES PATENT OFFICE

FOR SAVING GOLD,

Have been Awarded the First Premium at Mechanics' Fair for the Last Thirteen Years.

Every description of plates for Quartz Mills and Wet or Dry Placer
Amalgamator Machines made to order, corrugated or plain.

OVER 3,000 ORDERS FILLED!

References from every purchaser. Full weight of Silver guaranteed on every order.

The most extensive and successful manufacturer of these plates in the
United States. Will fill orders for delivery in Rocky Mountain and Pacific
Coast Mining States at lower prices than any other manufacturer.

Old Mining Plates Replated. Old Plates bought
gold separated for low percentage of result.

THE JENKINS STANDARD PACKING

IS ACKNOWLEDGED BY USERS AS THE BEST in the
world. Unlike all other Packings, the Jenkins Standard
Packing can be made any thickness desired in a joint by
placing two or as many thicknesses together as desired, and
following up joint, it vulcanizes in place and becomes a
metal of itself (it is frequently called Jenkins Metal), and
will last for years, as it does not rot or burn out. Avoid all
imitations, as a good article is always subject to cheap imi-
tations. The genuine has stamped on every sheet "Jen-
kins Standard Packing," and is for sale by the Trade
generally.

Manufactured only by

Mining Share Market.

The resumption of work in the Yellow Jacket mine on the Comstock, is the most notable feature connected with the mining share market. The reason of this resumption of work is simply because of the auxiliary steam arrangement at the Brunswick mill, on the Carson river, being completed a week or two sooner than was anticipated. The mill is now correspondingly increased in capacity beyond what was expected, and more men will be put to work in the mine as may be required. Milling facilities will not admit of the Crown Point and Belcher being started up for the present, but the machinery of the mills and works is being overhauled and put in thorough order, and when work is started up again it will be with good preparations for steady permanency.

Work in the middle mines, says the *Enterprise*, with a view to the practical development of the bonanza prospects, is being energetically advanced. The newly added section of the big hydraulic pump in the Combination shaft started off without any hitch whatever, and has been working steadily and perfectly ever since. This pump can easily handle more than double the amount of water thus far encountered in the lower levels, therefore no fears of any further flooding are entertained, and exploration work can now be pushed in any direction regardless of what bodies or seams of water may be encountered.

The Hale and Norcross deep winze has now reached the 300 level, and a station is to be opened shortly for a drift southeast, to connect with the Combination shaft or with the projected drift northwest from it.

New Incorporations.

The following companies have been incorporated and papers filed in the office of the Superior Court, department 10, San Francisco.

GUATEMALA CENTRAL R. R. Co., Aug. 22.—Location between Escuintla and City of Guatemala. Capital stock \$2,000,000 in 20,000 shares. Directors, Ariel Lathrop, F. C. Douth, N. T. Smith, C. E. Green and S. T. Gage.

AMADOR AND NEVADA G. M. Co., Aug. 22.—Capital stock \$10,000,000. Directors, W. S. Hobart, W. E. Eell, C. T. Bridges, W. D. Anderson and John H. Boalt.

TRINITY M. Co., Aug. 25.—Capital stock \$1,000,000. Directors, D. M. Seaton, Martin Quinlan, Asa H. Trueman, Robt. E. Low and James T. Hanna.

Bullion Shipments.

King, 22, \$3540; Calico M. Co., 22, \$1200; Butte, (M. T.), for week ending 15, \$76,512; Germania, 18, \$10,052; Crescent, 18, \$2200; Queen of the Hills, 18, \$1300; Germania, 19, \$6425; Hickory, 19, \$2054; Osceola, 19, \$443; Creedmore, 19, \$392; Germania, 20, \$5835; Hanauer, 19, \$2450; Crescent, 20, \$3500; Queen of the Hills, 20, \$1500; Hanauer, 20, \$2400; Stormont, 22, \$2800; Queen of the Hills, 22, \$1600; Hanauer, 22, \$7000; Mayflower, 22, \$1450; Germania, 23, \$4600; Ontario, 22, \$29,996. The banks of Salt Lake City report the receipt for the week ending August 19th, inclusive, of \$85,201.99 in bullion and \$16,140.99 in ore; a total of \$101,342.98.

Our Agents.

OUR FRIENDS can do much in aid of our paper and the cause of practical knowledge and science, by assisting Agents in their labors of canvassing, by lending their influence and encouraging favors. We intend to send none but worthy men.

Complimentary Samples.

Persons receiving this paper marked are requested to examine its contents, terms of subscription, and give it their own patronage, and, as far as practicable, aid in circulating the journal, and making its value more widely known to others, and extending its influence in the cause it faithfully serves. Subscription rate, \$3 a year. Extra copies mailed for 10 cents, if ordered soon enough. If already a subscriber please show the paper to others.

Don't Fail to Write.

Should this paper be received by any subscriber who does not want it, or beyond the time he intends to pay for it, let him not fail to write us direct to stop it. A postal card (costing one cent only) will suffice. We will not knowingly send the paper to anyone who does not wish it, but if it is continued, through the failure of the subscriber to notify us to discontinue it, or some irresponsible party requested to stop it, we shall positively demand payment for the time it is sent. LOOK CAREFULLY AT THE LABEL ON YOUR PAPER.

AMERICAN MINING ENGINEERS.—The next meeting of the American Institute of Mining Engineers will be held at Halifax, commencing on Wednesday, Sept. 16. A number of excursions are proposed, and about a dozen papers are announced.

MINING SHAREHOLDERS' DIRECTORY.

NEW BOOKS ON ASSAYING.

By C. H. AARON.

PART I.—Gold and Silver Ores.—Price \$1.

This new work is written by an experienced metallurgist who has devoted many years to assaying and mining previous ores on the Pacific side of the American Continent. He writes whereof he knows from personal practice, and in such plain and comprehensive terms that neither the scientist or the practical miner can mistake his meaning. The work, like Mr. Aaron's former publications ("Testing and Working Gold and Silver Ores," "Leaching Gold and Silver Ores") that have been "successfully popular" is written in a condensed form, which renders his information more readily available than that of more wordy and less conscientious writers. The want of such a work has long been felt. It will be very desirable in the hands of many.

Table of Contents:

Preface; Introduction; Implements; Assay Balance; Materials; The Assay Office; Preparation of the Ore; Weighing the Charge; Mixing and Charging; Assay Litharge; Systems of the Crucible Assay; Preliminary Assay; Dressing the Crucible Assays; Examples of Dressing; The Melting in Crucibles; Sinterification; Cupellation; Weighing the Bead; Parting; Calculating the Assay; Assay of Ore Containing Coarse Metal; Assay of Roasted Ore for Solvent To Assay a Cupel; Assay by Amal amalgam; To Find the Value of a Specimen; Tests for Ores; A Few Special Minerals; Solubility of Metals; Substitutes and Expedients; Assay Tables.

The volume embraces 106 12mo. pages, with illustrations, well bound in cloth; 1884. Price, \$1. postpaid. Sold by DEWEY & CO., Publishers, No. 252 Market Street, San Francisco.

PARTS II AND III.

Lead, Copper, Tin, Mercury, etc. Price \$1.75.

This book is entitled "Assaying—Parts II and III," and is separate from Part I, and treats of Gold and Silver Bullion, Lead, Copper, Tin, Mercury, Zinc, Nickel, Cobalt, etc.

Table of Contents:

Gold and Silver Bullion; Apparatus; Melting Bullion; Assaying Bullion; Humid Assay of Silver; Manipulation; Ores; Lead Ores; Copper Ores; Voluntary Assays; Parkes' Process; Amalgamation; New Process; Preparation of Potassium Zanthate; Electrolytic Determination of Copper in Ores, etc.; Assaying of Tin Ores; Assaying of Zinc Ores; New Method; New Assay of Nickel and Cobalt; Assay of Chromium; Assay of Bismuth; Assay of Arsenic; Assay of Antimony; Assay of Sulphur; Assay of Salt; Appendix to Part I; Notes on Crucible Assays; Weighing by Oscillations; Appendix to Part III; The Assay of Lead; The Assay of Copper.

There are 160 12mo. pages with illustrations in the volume, which is bound strongly in cloth. Price postpaid, \$1.75. Sold by DEWEY & CO., Publishers, No. 252 Market St., S. F. These are much needed books for miners and other practical men. They are invaluable for the mill and mine worker, and equally good for scientific experts. They are thoroughly practical books.

THE OVERLAND MONTHLY.—This praiseworthy local periodical has shown unusually attractive tables of contents for the last few months. The conduct of the *Overland* is now in the hands of two well-known literateurs, Charles H. Shinn and Milcent W. Shinn, the former as business manager, the latter as editor, and both using their best talents and industry in the upbuilding of the magazine. It is pleasing to their friends to notice many indications of success. We are informed that the leading article for September will be by Prof. Josiah Royce, of Harvard, late of California, upon "The Sacramento Squatter Riot of 1850." Flora Haines Apponyi will furnish a personal sketch of the late Helen Hunt Jackson, and Ina D. Coolbrith will contribute a poem. These, with editorial comments upon Mrs. Jackson's literary work, will give this number great value as a memorial of the author of "Ramona." There will be an article from Hon. S. S. Cox, Minister to Turkey, on "The Thirty-Fifth and Thirty-Sixth Congresses." Dr. Henry De Groot will furnish a graphic account of the ancient "Mining Camp of You Bet." Capt. Wright, of the Confederate Army, and late lecturer of the California State Grange, will describe "How the Blockade Was Run." The most important stories will be: "A Plea before Judge Lynch," written by a well-known pioneer, and, "The Doctor of Leidesdorff Street," a brilliant and exciting story of San Francisco. These are only a few of the attractive and valuable articles to appear in September.

GREAT excitement! Rush for Muller's pebble spectacles. 135 Montgomery street, near Bush, X

324,564.—SKATE—C. G. Lamont, Astoria, Or.
324,498.—OBSTETRICAL SUPPORTER—Jos. T. Surbaugh, Modesto, Cal.

NOTE.—Copies of U. S. and Foreign Patents furnished by DEWEY & Co., in the shortest time possible (by telegraph or otherwise), at the lowest rates. American and Foreign patents obtained, and all patent business for Pacific Coast inventors transacted with perfect security and in the shortest possible time.

Notices of Recent Patents.

Among the patents recently obtained through DEWEY & Co.'s SCIENTIFIC PRESS U. S. and Foreign Patent Agency, the following are worthy of special mention:

OATMEAL MACHINE.—James C. Holloway, S. F. No. 324,556. Dated Aug. 18, 1885. This invention relates to that class of oatmeal mills in which a rotating perforated rim is adapted to cut the oats against an exterior annular series of knives. The object of the invention is to provide a simple, effective and rapidly-working oatmeal mill of great capacity.

HARNESS CHECK.—Wm. B. Frost, S. F. Assignor of one-half to Geo. S. Ingersoll. No. 324,765. Dated Aug. 18, 1885. This consists of a check ring of either the form known as "side" or "over" check attached to the hit, passing through the usual guides or runners, and thence to a point where it is attached to the reins by which the horse or horses are driven, and an independent guide or terret.

BUDDING KNIFE.—Harry E. Hulbert, Santa Rosa. No. 324,700. Dated Aug. 18, 1885. The budding knife consists in a blade suitably mounted in a handle, and provided on its cutting edge, back of the point, with a small piece of a cone taken from vertex to base, and laid with its flat side down and point forward, or resembling somewhat the shape of an ordinary flat-iron. The object is to provide a simple budding knife adapted to be handled easily, accurately and rapidly.

CRYSTAL SPRINGS RURAL HEALTH RETREAT,

ST. HELENA, CAL.

This delightful and popular Resort for Tourists and Invalids is situated on the side of Howell Mountain, 1200 feet above tide level, 500 feet above and overlooking Napa Valley, and two and a half miles from St. Helena, in Napa County.

THE NATURAL ADVANTAGES

Of the Health Retreat surpasses those of any other health resort. It is noted for its pure water, dry atmosphere, clear and balmy sunshine, even temperature, mild breezes, and the absence of high winds. Across the valley lies the Sonoma Mountain Range, breaking the sea breeze and shielding the Retreat from the chilling atmosphere of the coast, and presenting a safeguard against earth and di-cases. The grandeur of its mountain ranges, with its stupendous peaks lying in beauty at their feet, the famous Mount St. Helena rearing its lofty head to the clouds, the grassy plain lying beneath, reflecting the sunbeams like a grand mirror before the Retreat, all perfumed with a variety of wild flowers, lend an enchantment to this unsurpassed scene.

MALARIA IS A STRANGER TO THE RETREAT,

And in all this beautiful valley. In fact, the purity of the air on this hillside and in the upper valley, is a specific for malaria, and all diseases affecting the head, throat, and lungs; producing a healthy circulation through internal passages generally.

COME TO THE RETREAT.

Most ailments can be cured by proper care and judicious treatment. All may be benefited. Are you a professional man, a Judge, Lawyer, Minister, or Doctor, suffering from mental exertion? Are you a business man, exhausted mentally and physically by too close application to business, and burdened with responsibility, troubled with constant thought of your ailments, dread of life or fear of death? Come to

CRYSTAL SPRINGS

And we will do you good. Remember that all these are but symptoms of disordered nerves, deranged stomach, liver, and other digestive organs that may be cured and leave you easy, and happy, and feeling younger for your stay with us. The treatment invigorates you, gives you a light heart, a quiet stomach, and a cheerful countenance. We employ no quick remedies, no patent nostrums. We treat all cases by the most recent knowledge of

HYGIENIC AND RATIONAL PRACTICE.

Disease is the enemy of nature against the constant violation of her laws, and calls for hygienic regulation and wise observance of known physiological law. Then all will be peace again. Especial attention is called to all persons suffering from

CHRONIC DISEASES.

It is a well-known fact and recognized by all advanced pathologists of to-day that there is no specific for chronic ailments. They are only cured by hygienically removing the cause and giving nature time a proper conditions to heal itself. All surgical and mechanical assistance necessary in such cases is scientifically rendered. New facilities are constantly being added to make this the most advantageous, desirable, and efficient, as it is now the most natural and healthful

WINTER RESORT

In America, while a radical table is furnished for Invalids and proper diet prescribed for each individual case, no one is confined to a starvation diet, and better and more ample variety is furnished at meals than is usually found upon invalid tables elsewhere. All questions cheerfully answered. Persons desirous of knowing whether their case is one of probable cure, may do so before coming, by addressing RURAL HEALTH RETREAT.

The Managers have opened the Retreat under a new and experienced Director. They have secured the services of a thoroughly competent physician from New York, of nine years' experience in practice. Being a graduate from a three years' course of medicine and surgery in one of the New York Medical Colleges, it is his intention to keep abreast of the age in his profession. He is assisted by two lady attendants having a two years' course at one of the largest Hygienic and Surgical Sanitariums in the world, with five years' subsequent practice. Especial inducements offered to all suffering with ailments peculiar to females. The Retreat is also opened as a

SUMMER RESORT

To all who desire to spend a few weeks or months in recreation and receive the benefit from rest and breathing this mountain air, whose evenness and purity is unsurpassed. For such a wholesome and liberal table is especially provided. While the Chief Object of this institution is to afford a Sanitarium for those in need of Hygienic and Surgical Treatment, ample means are afforded for recreation, and entertainment is provided for all boarders and pleasure seekers who love decency and good order. Winding and picturesque roads, walls of blasted rock terracing the sidehills about the main building, cottages, and drive-ways, a fine campus, spacious woods, shady groves, arbored seats, swings, swinging rings, swinging chairs, rowing machines, machinery for developing the muscles and expanding the lungs, dumb-bell, and Indian club exercises are found here.

Are a factor of no small interest in coming to the Retreat. A Natural Cave, extending over 400 feet into the mountain, is within a few minutes' walk of the Retreat. A trip overland, twelve miles, through the pleasant and beautiful Napa Valley, of vines and flowers, to the Petrified Forest, can be made any day by a small party. Hotel accommodations or camp furnished. The summit of Round Tower Mountain, less than one-half mile from the Retreat, can be reached by a few minutes' walk, which, with its view covering of Madonna, Live-oak, and Fire, furnishes an unlimited source of enjoyment and interest to the pleasure seeker and admirer of nature. Situated as we are, with the city and bay of San Francisco, with its Golden Gate and the old Pacific Ocean, but 60 miles south of us, and the famous Mount St. Helena towering high above all round, and looking down upon us from the north, this is just the place for

EASTERN TRAVELERS

Tosken and regain their health, and at the same time view the curiosities and natural beauties of this portion of California, and escape the long, tedious, and sickly winter of the Eastern, Southern, and Middle States; for the winter season here is like the beautiful Spring time in the East. Geraniums, Verbenas, and Callas bloom all Winter in the open air.

LOOK AT IT

And think twice before you conclude to go to some other resort where they substitute for natural advantages "rare mineral water," but come and see for yourself where the water is pure as crystal.

EXPENSES.

Rooms, with board, Regular Treatment, \$15 to \$20 per week; without Treatment, from \$9 to \$15. Specially favorable terms for families and others by the month. Some rooms in cottages can be furnished at reasonable rates. Office treatment and surgical operations extra.

TESTIMONIALS.

OAKLAND, CAL., February 22, 1884.

I have visited a number of the "Springs" and "Resorts" in California, and without hesitation can say that the "Health Retreat" is the most delightful of them all. The water is pure; the climate cannot be excelled; and the scenery is unequalled. Baths may be taken here under the direction of experienced practitioners and nurses—an advantage which I have found at no other place which I visited. At one place (Hot Springs) I found an intelligent superintendent who informed me that many invalids came to his place who, by the injudicious use of baths, rendered their recovery almost impossible; but as they did not pretend to govern visitors in that respect, his advice would not be regarded if offered. At the "Health Retreat" it is not so. The feeblest may trust themselves with confidence in the hands of those who have charge of it. It is a quiet, pleasant, home-like place, where the sick are cared for and treated in harmony with nature's laws, and where the weary may find the most enjoyable rest.

E. D. J. H. WAGGNER,

Editor Signs of the Times, Oakland, Cal.

ST. HELENA, CAL., June 11, 1885.

Finding myself gradually failing, becoming emaciated, and with a bad cough, I was warned of consumption; I went to "Rural Health Retreat," weighing 130 pounds. Was happily surprised to find myself improving in one week. Now, at time of writing, my cough is entirely gone; have free use of both my lungs; weigh 155 pounds, a gain of 25 pounds in four weeks. Words are feeble to express my regard for the "Retreat," its physician, and managers, who have the rare faculty of making you feel perfectly at home. I feel that the mercy of God attended their efforts, and to them I owe my speedy and remarkable restoration.

E. D. JOHN A. BURDEN, E. Portland, Oregon.

Persons sending notice previously will be met at the St. Helena depot by a carriage from Retreat. For further particulars and information, address

EUCALYPTUS

Boiler Scale Preventive and Remover.

This Preparation is now in use in many thousands of Steamship and Stationary Boilers all over the World, and has always driven other Scale Removers out of the Market when they have come into Competition.

WHAT IS SAID OF IT.

U. S. NAVY.

"On the surveying cruise of this vessel previous to this, similar in all respects, I found it necessary at times to scale the boilers. The use of Eucalyptus has obviated this necessity." "The use of Eucalyptus has been proved to protect the iron of the boilers from corrosion.—Report of Chief Engineer U. S. S. Ranger."

P. C. S. S. Co.

"I have used many kinds of scale removers, and never found anything that could do as thorough work as yours does. What we have used has paid for itself many times over in the saving in boiler repairs alone."

JOHN COSOROV, Supt. Eng'r P. C. S. S. Co.

O. & O. S. S. Co.

"I hope never to be without it."—T. Toulson, Chief Eng'r S. S. Arabic.

JOHN ROACH & SONS, N. Y.

"Your preparation is perfect in its working and a complete success in all things for which it is intended."

F. DORRITY, Supt. Forging Dept. Morgan Iron Works.

FULTON FOUNDRY.

"We find it to be the best in use for removing scale."—H. P. Christie, Supt.

STARR'S MILLS.

"It is a success, and we advise and endorse its use strongly."—Starr & Co., per A. D. Starr.

BUCKEYE MILL, MARYSVILLE.

"We have never in our experience of 15 years found anything to equal it."—Buckeye Mill Co., per Justus Greeley.

GIANT POWDER WORKS.

"I cheerfully add my testimonial to the many given already in regard to the efficacy of your scale remover."

FRANK ROLLER, Supt.

U. S. MINT.

"I take pleasure in recommending it as the best and cheapest thing I have used."

Geo. L. HARRIS, Chief Eng'r U. S. Mint.

HOOD'S FOUNDRY COKE.

Consumers are respectfully informed that owing to inferior brands of Coke having been sold
in this and other countries under the name of "Patent Coke," the Glamorgan Coal Co.
(Limited), Cardiff, in May, 1884, abandoned the title of "Patent Foundry Coke," substituting
that of "Hood's Foundry Coke."

This Coke is exclusively used by the Selby Smelting and Lead Co., Union Iron Works,
Professor Thomas Price, and other consumers here. Large quantities are regularly forwarded
to Copper Smelters in Arizona and New Mexico, and also to consumers in Nevada and Salt Lake.

The undersigned are the SOLE IMPORTERS of the above Coke, which is for sale in quanti-
ties to suit purchasers.

PLANTS FOR GOLD AND SILVER MILLS,
embracing machinery of LATEST DESIGN and
MOST IMPROVED construction. We offer our cus-
tomers the BEST RESULTS OF 35 YEARS' EX-
PERIENCE in this SPECIAL LINE of work, and
are PREPARED to furnish from SAN FRAN-
CISCO or CHICAGO, the MOST APPROVED
character of MINING AND REDUCTION MA-
CHINERY, adapted to all grades of ores and SU-
PERIOR to that of any other make, at the LOWEST
POSSIBLE PRICES.

We are also prepared to CONSTRUCT and DE-
LIVER in COMPLETE RUNNING ORDER,
in any locality, MILLS, CONCENTRATION
WORKS, WATER JACKET SMELTING
FURNACES, HOISTING WORKS, PUMP-
ING MACHINERY, ETC., ETC., of any DE-
SIRE CAPACITY.

WATER JACKET SMELTING FURNACES

For COPPER and ARGENTIFEROUS LEAD
ores of NEW and ORIGINAL DESIGNS, covered
by LETTERS PATENT. No other Furnace CAN
COMPARE with these for DURABILITY, and in
CAPACITY for uninterrupted work. MORE
THAN 150 of them are now RUNNING in various
parts of THIS COUNTRY, as well as many in
FOREIGN COUNTRIES, giving results NEVER
BEFORE ATTAINED as regards CONTINUOUS
running, ECONOMY of fuel, AMOUNT and QUAL-
ITY of BULLION produced. These CLAIMS have
been PROVEN BY RESULTS in ANY NUM-
BER of INSTANCES, and the GREAT SUPE-
RIORITY of this SYSTEM of smelting ores DE-
MONSTRATED BEYOND QUESTION. COM-
PLETE PLANTS furnished to order of any CA-
PACITY, with ALL IMPROVEMENTS that ex-
perience has DEMONSTRATED as VALUABLE
in this class of work.

Beyond question the cheapest and
most effective machine of the kind
now in use adapted to all grades and
classes of ores.

This machine has been THOROUGHLY TESTED
for the past TWO YEARS, under a GREAT VA-
RIETY of CONDITIONS, giving most EXTRA-
ORDINARY results FAR IN ADVANCE of
anything EVER BEFORE REALIZED. A re-
cent COMPETITIVE TEST at the Carlisle Mine in
Mexico, showed an ADVANTAGE OF OVER 30
PER CENT in favor of THE DUNCAN. The
amount SAVED OVER THE TRUE being suffi-
cient to PAY THE ENTIRE COST of the ma-
chines EVERY MONTH OF THE YEAR. One
of its MOST VALUABLE features is as an AMAL-
GAMATOR. It saves all THE AMALGAM GOLD
AND SILVER that ESCAPES the BATTERIES,
PANS or SETTLERS, making the machine worth
MORE than ITS COST for THIS PURPOSE
ALONE.

Baker's Mining Horse Power.

Possessing all the requirements of a first-class hoist,
and affording means for the continuous operation of a
Pump or Blower, without interfering with a hoisting ap-
paratus. It is made entirely of iron, no piece weighs
over 300 pounds. At the ordinary speed of a horse, a
1,000-pound bucket of ore may be raised 120 feet per
minute. The hoisting-drum is under the complete con-
trol of the man of the shaft, and is capable of carrying
500 feet of five-eighths steel rope. SEND FOR CIRCULAR.

\$1,000 CHALLENGE!

**THE FRUE ORE CONCENTRATOR,
OR VANNING MACHINE.**

PRICE: FIVE HUNDRED AND SEVENTY-FIVE DOLLARS,
(\$575 00), F. O. B.

OVER 1,000 ARE NOW IN USE. Saves from 40 to 100 per cent more than any other Concentrator Concentrations are clean from the first working. The wear and tear are merely nominal. A machine can be seen in working order and ready to make tests at the Fulton Iron Works, No. 229 Fremont Street, San Francisco.

As the result of a suit East against an End-Shake Machine (the Embrey), similar to the Triumph, the Frue Vanning Machine Company owns the Embrey patent, and can put in the market an End-Shake Machine of earlier patent that will do as good work as the Triumph, and superior in construction and durability. There will be no risk of suit for infringement.

The Frue Vanning Machine Company warn the public that they claim and will prove the Triumph machine to be an infringement on patents owned by them.

Protected by patents May 4, 1869, Dec. 22 1874, Sept. 2, 1879, April 27, 1880, March 22, 1881, Feb. 20, 1883, Sept. 18, 1883. Patents applied for.

N. B.—We are and have been ready at any time to make a competitive trial against the Triumph, or any other Concentrator for stakes of \$1,000.

ADAMS & CARTER, Agents Frue Vanning Machine Co.,

SAN FRANCISCO, CAL.

\$1,000 CHALLENGE ACCEPTED!

PRICE, FIVE HUNDRED AND FIFTY DOLLARS
(\$550.00), F. O. B.

THE "TRIUMPH" TRIUMPHANT!

**THE
"TRIUMPH" ORE CONCENTRATOR.**

In a competitive trial recently had between two of the "Triumph" Ore Concentrators and the same number of "Frue" Vanning Machines, at the mill of the celebrated gold producing Original Empire Mill and Mining Company, in Grass Valley, Nevada County, Cal., the "Triumphs" produced thirteen and fifteen one-hundredths (13.15) per cent more concentrations than did the "Frue" Vanners, during a run of twenty-four consecutive days, or a net gold coin result of \$199.15, or \$3.30 per day, in favor of the two "Triumph" Concentrators.

These returns do not include the value of the amalgam saved by the "Triumphs" during the test, which will add to the net gain. The form of construction of the feed bowl is such that considerable amalgam is necessarily saved, which is lost on the "Frue" Vanners. This trial was conducted under the personal supervision of the Manager and Superintendent of that Company, in a strictly fair and impartial manner, and with the sole view of determining, in the interest of that Company, the merits and demerits of the respective machines by a thoroughly practical test. A relation of the course of procedure, a concise analysis of assays, and a tabulated statement of the net bullion results, with accurate deductions therefrom, will soon be published in Circular form.

The superiority of the present construction of the "Triumph" over the form originally introduced, together with the demonstrated results of the above, and other trials had with the "Frue" Vanners, induce us to and we hereby accept the Challenge of \$1,000, floated by the Agents of the "Frue Vanning Machine Company," and hold ourselves in readiness to enter into a second competitive trial for that sum, at such place and upon such terms and conditions as may hereafter be mutually arranged.

We guarantee purchasers against all costs, expenses or charges incurred by reason of any infringements of any existing patents.

"Put up or shut up," and "Let the Best Machine win!"

MINING AND SCIENTIFIC PRESS.

An Illustrated Journal of Mining, Popular Science and General News.

BY DEWEY & CO.,
Publishers.

SAN FRANCISCO, SATURDAY, SEPTEMBER 5, 1885.

VOLUME LI
Number 10.

Dillenburg's Pipe-Coupling.

Michael Dillenburg, of this city, has patented, through the Mining and Scientific Press Patent Agency, a new form of pipe-coupling which consists of a split sleeve fitting on the pipe, and having a conical or wedge-shaped exterior surface, a head having a correspondingly-shaped aperture in which the sleeve is seated, a tubular connecting sleeve or link fitting upon the end of the pipe and seated within the inner portion of the aperture of the head, which is made with a plane surface to receive it, a washer between the tubular connecting sleeve and the split sleeve, and tie-bolts connecting the two heads.

The object of the invention is to provide a simple and effective pipe-coupling, without having to resort to threading the pipes. The coupling is a two-part one, the parts on one side being the counterpart of those on the other. For the sake of clearness, we shall use the singular number in describing them. Figure 1 is a front view of the split sleeve. Figure 2 is a view of the coupling, one-half being in section and the other half in elevation.

A is the pipe. B is the split sleeve, having its exterior surface of a wedge or conical shape. The sleeve is fitted on the pipe, with its base or portion of largest diameter adjacent to the end to be coupled, though removed therefrom a short distance.

C is the head. It consists of a casting or other piece having a central aperture, c. The inner portion of the aperture has a perfectly plane or parallel surface, whence said aperture continues in a conical shape, corresponding to the shape of the split sleeve B, which is seated therein.

Around the end of the pipe and against the inner end of the sleeve is a washer, D. B is the tubular sleeve or connecting-link, consisting of a short section of pipe. It is seated within the plane or parallel portion of the aperture of the head, and encircles the end of the pipe and bears against the washer. F are the tie-bolts between the two heads, and f are the nuts by which the bolts are set up.

The operation of the device is as follows: By tightening up the bolts the heads are drawn together, which, acting on the connecting-sleeve E, causes said sleeve to force the split sleeves apart.

These, being confined in the conical aperture of the heads, bind the tighter upon the pipes and hold them. The washers prevent any leak.

This device is applicable to the coupling of a pipe on to an elbow as well as to another pipe.

Among the advantages claimed by the inventor for this novel form of pipe coupling is that no threads have to be cut on the pipe. Moreover, there is no need to cut the pipe to exact lengths in order to make an exact joint, as the ends do not need to come together, but can be connected even if an end is a half an inch apart. Neither pipe nor any part of the coupling needs to be turned to make a connection. The coupling can be put on with the hands with the assistance of a small monkey wrench, and will be perfectly tight for gas or water. The fact that no threads have to be cut admits of this coupling being made very cheap. Mr. Dillenburg's address in this city is 909 18th street.

MANY miles of valuable timber have been destroyed by the forest fires in British Columbia.

Copper and Lead Smelting in Australia.

A recent issue of the London *Mining Journal* makes mention of the fact that the Cloncurry Copper Company of Queensland, Australia had got into successful operation the Water Jacket smelting plant furnished them by the Pacific Iron Works, of San Francisco, and were turning out copper bullion at a great saving on previous cost of production. The company now feel confident that the facilities afforded by this process will enable them to make a good profit on their product at the present extremely low prices, as well as to meet any further possible decline.

This process is also, we learn, being extensively adopted by many other companies in Australia, as well as in South America. The severe competition to which copper producers in all parts of the world are now being subjected is compelling

The chances are that before very long there will be many miles of cable railroads in New York City. It has taken a long time to get them introduced there, but the opposition has been mainly due to the existing street railroad companies who have until now successfully opposed their introduction. It is stated now, however, that the system is looked on with favor, and one road having commenced running, others will follow.

It seems that they are having some of the same trouble with the system that other Eastern roads have experienced, as a dispatch from there this week states that the new cable cars are not yet a success. There were provoking delays. The engineers say new grips were put on the cars, with the supposition that they were going to be a big improvement on the grips used in operating

DILLENBURG'S IMPROVED COUPLING.

The V-Notch Water Gauge.

The accompanying figure represents a water gauge with V-notch for measuring the flow of water. In the circular of the Risdon Iron and Locomotive Works of this city, is given a very extended table which shows the flow of water in cubic feet per minute through a notch of 90 degrees. Those who use this form of gauge can determine the flow for themselves by using the following formula:

The formula for the V-notch is thus expressed where the angle of the notch is 90°.

$Q = .306 H^{\frac{5}{2}}$ Q = Cubic feet per minute. $.306$ = A constant coefficient determined by experiment. H = The

height of the water in the gauge above the bottom of the notch, measured in inches, about two feet back from where the water is flowing out. $H^{\frac{5}{2}}$ can also be expressed $\sqrt{H^5}$, which means that the height H is to be multiplied by itself five times, then extract the square root.

The large coal mines at Rock Springs, 250 miles west of Cheyenne belong to the Union Pacific Railroad Co. The company recently imported some 400 Chinamen to take the places of white miners, but the latter, armed with shotguns, have driven the Chinamen away from the mines and burned their quarters.

MARSDEN Manson, Chief Engineer of the State Harbor Commission, has been selected as consulting engineer in connection with the proposed system of Stockton city sewerage.

COMPLAINT is made that some of the iron girder work brought from the East for house construction here, is not made in compliance with the law of this city.

CORRESPONDENCE.

We admit, unendorsed, opinions of correspondents.—EDS.

Northern Arizona Mines.

EDITORS PRESS:—Although in the northern half of Arizona there are few mines well developed and systematically worked, when compared with the number in the southern part of the Territory, it is not because the mineral is wanting. The placers have been made to disgorge millions and a few quartz ledges have paid handsome profits for a long term of years, but for every mine—deserving of the name—there are fifty locations on which nothing but assessment work has ever been done and in a majority of cases the "improvements" are of no practical advantage in determining the extent of the lode, or the richness of the ore, being confined mainly to surface scratching. To the few who have carried their work beyond this point a debt of gratitude is due from other miners. Gold, silver, copper and other minerals are known to exist in many localities, often with the most favorable indications, but nothing is so convincing as a well explored ore body. One of the two copper mines, or groups of mines, in

Yavapai County

That have been regularly worked, the United Verde, was visited by your correspondent recently, and merits notice. It is situated on the eastern slope of the Black Hills (which range and others farther north are not yet well prospected) and twenty-eight miles northeast of Prescott.

Riding first along the foothills of the Sierra Prieta the road crosses Lonesome valley—true to its name—enters the Black Hills on the west and passes over the summit at an altitude of 7000 feet above sea level. The formation is mainly limestone, and a few old kilns are to be seen by the roadside which formerly supplied the local market. On the eastern descent the lime continues in horizontal stratifications—noticeable on all the ridges for miles along the range—until within a short distance of the mines when it is succeeded by diorite, which marks the line of the mineral belt. The whole region is capped by lime. The western spurs of the Mogollon mountains on the opposite side of the Verde valley are quite similar in appearance. Turning the point of a large mountain the road descends into a small gulch lying between high ridges, the one on the south terminating in precipitous bluffs. In this gulch are noticed bold outcroppings showing copper stains at a considerable distance, and here are the buildings of the company, tenantless at present, for the mine has been shut down temporarily. Besides commodious lodging houses there are the business office, assay office, blacksmith shop, hoisting works, furnaces, coke bins, etc., and a few hundred yards further down a cluster of houses known as the village of Jerome hangs from the side of the mountain. The original locations were the Wade Hampton, Eureka, North Chrome, South Chrome, Hermit and Venture, all now included in the United Verde Company's property.

On the mountain side above the tunnel on the chrome may be seen the

Works of a Prehistoric People,

Once numerous in the valley below, where remains of their stone structures still exist. They had stoped out the red oxide ore to a depth of 80 feet, but their works have since been filled up with debris washed from above, in which oak trees are now growing. Stone hammers, buck-horn picks and other implements were found when excavating their old works. Blue and green carbonates were also encountered in their workings, and as some of the best copper ore taken out by them was untouched, it is presumed they were in search only of material for pigments. Near by in a large open cut on the Eureka was taken out a large amount of carbonate and black oxide running high in silver, and carrying some gold. Later work has been confined to lower levels. In the old dumps are to be found many specimens rich in native and horn silver and gold, as well as malachite, azurite, bluestone, etc. The total

Amount of Development

Done in the way of sinking shafts and winzes, and extending tunnels and drifts, and some of which was purely exploring work, but attended with excellent results, will aggregate 2500 feet. A tunnel on the South Chrome, the first we entered, exposes for the first 30 or 40 feet a body of carbonate ore assaying 20 per cent in copper, after which it passes into oxy sulphurets yielding a much higher percentage of bullion. The developments in the Eureka, the original location, 450 feet west of the South Chrome, have been greater. A tunnel 275 feet in length is in low grade ore, averaging 10 per cent copper and 15 ounces in silver, but in the face a richer oxy sulphuret was struck, assaying 30 per cent. From a sump 28 feet square at this point 500 tons of ore was taken, averaging as above. A crosscut running east toward the Chrome traverses a low grade body for 150 feet, where an oxy sulphuret like that in the face of the tunnel is encountered. This crosscut was continued 95 feet further to the east side of the ore body, determining its width, 15 feet through 25 per cent ore and 80 feet through ore averaging 33 per cent. Over this crosscut a shaft has been sunk from the surface, 45 feet being through

the same rich ore, the balance through slate and iron-cap. In all of these tunnels and drifts the country rock is found to be principally slate. The greatest amount of work has been done on the Wade Hampton, a continuation of the Eureka, which lies on the north side of the gulch. Open cuts made in the croppings produced ore rich in both gold and silver. About 200 feet from the tunnel, on the Eureka, a shaft has been sunk 150 feet, over which hoisting works are erected. On the first level, at a depth of 80 feet, considerable work has been done, a large amount of ore having been stoped out nearly to the surface. A drift run in 40 feet struck the main ore body, and continuing northwest diagonally across it exposed a vein of azurite and carbonate ore 50 feet wide, which averages 25 per cent. Large caves were encountered in mining this crosscut, showing up rich ore 15 to 30 feet below its level. On the 150-foot level a good deal of prospecting work has been done. A drift run under the Eureka developments pierces the large rich body of oxy sulphurets spoken of, 80 feet wide, for a distance of 250 feet. Thus by the developments in the Eureka and Wade Hampton it is known to be 300 feet long, but as the northern limit has not been reached in the former or the southern in the Eureka or Chrome, its total length has not been determined, and it is not known whether it be a true vein or an immense deposit of ore. Nor has the depth been ascertained. At present there are over 300,000 tons of ore in sight, and how many times this may be multiplied cannot be well estimated at present. This amount of ore, if containing only 20 per cent copper, which is lower than assays or working tests, would produce 60,000 tons of bullion. The company has a 30-ton

Water Jacket Smelting Furnace

conveniently situated between and below the mines, and quite near to each, from which was produced daily 8 to 10 tons of copper matte, yielding 98 per cent refined copper. The largest run made in one day was 16 tons of black copper. The furnace was started August 1st, 1883, and up to December, 1884, when work was discontinued, had produced 2700 tons of matte, valued at \$930,000, of which \$300,000 was gold and silver. Another 30-ton water jacket was completed before work was discontinued, but has not been used. This will enable the company to double the yield. The ore contains enough iron to smelt well, and the only flux used is lime, of which there is a great quantity in the immediate vicinity, but even this may not be necessary. There is an abundance of wood near by for fuel and mining timbers. Water is brought in iron pipes two and a half miles, and the supply is more than ample for all uses. Hay, grain, fruit, vegetables, etc., are grown in the valley below, and in many respects the mine is favorably situated; but in one it is not at the present time.

By the road over the Black Hills it is 56 miles to Ash Fork, on the Atlantic and Pacific Railroad, but there is a shorter one running northward through the valley of the Verde. The cost of transporting bullion to the railroad was \$20 per ton, and the same for freighting coke from the railroad to the mine; and as a ton of coke is required to produce a ton of bullion, there was consequently a freight tax of \$40 on every ton of copper by the time it reached Ash Fork. Owing to this high tariff, and to the low price of copper, work was suspended, to be resumed again as soon as the outlook becomes more favorable. Although the mine was running at a profit, the company thought they could make good interest by reserving their ore for better times. As the mine furnishes employment for 150 men when running, its suspension was much regretted. The completion of the Prescott and Arizona Central Branch Railroad from the A. & P. would materially lessen the distance and cost of freighting by wagons, and a reduction of one cent per pound on hullion and coke would result in a saving to the company, with both water-jackets in operation, of \$400 a day, or for the year (300 days) \$120,000, in itself quite an item. When this branch road is completed (which it is expected to be in the course of a few months) the mine will not occupy its present position of isolation as regards transportation facilities.

The other mines mentioned as belonging to this group your correspondent did not visit. In the North Chrome very little work has been done. The Hermit and Venture, some distance down the mountain, have produced several hundred tons of ore richer than any in the mines described, some found in the latter going as high as 80 per cent in copper. The extent of the vein in those mines, or deposit, which it seems to be, is not known.

There Are Other Mines of Copper

As well as of gold and silver, in Northern Arizona which would undoubtedly be valuable properties, and could be made to return large profits if communication with distant markets were less difficult and expensive. Even with the prevailing low price of copper mines would pay good dividends if it were not necessary to haul hullion and supplies such great distances in wagons over mountain roads. It is confidently expected that the completion of the railroad mentioned will be followed by increased activity in the development of mining interests in all parts of the Territory tributary to it. Returning from the United Verde

A Curious Intermittent Spring

Was visited about two miles southwest. Two or three years ago some men engaged in digging a

well were surprised on returning to their work one morning to find it filled with water and a large stream running over the top. They had left it the night before about twelve feet deep and perfectly dry. Shortly after the water stopped running and a visit to the well showed it to be empty but with a hole a little more than a foot in diameter on the west or mountainside. Two days later the well filled and overflowed again, and has since continued in the same manner. It is said that at first it flowed regularly every third day, but an Italian who uses the water for irrigating a large garden informed the writer that when the moon is full it flows every second day, and during the remainder of the month every third day. Judging from the size of the aperture in the side of the well, and of the ditches carrying off the water, the volume discharged must be at least 50 miner's inches, or one cubic foot per second. We were informed that a short distance up the ravine in which it is situated are two more intermittent springs. Many theories have been advanced, explaining the cause of the interrupted flow from this well or spring, the one most generally accepted being that the outlet acts on the principle of a syphon, emptying a reservoir somewhere in the heart of the mountain whenever the water rises high enough to permit it to flow downward into the channel tapped by the well. This is reasonable and may be the correct explanation.

Geo. W. STEWART.

Prescott, A. T., Aug. 30, 1885.

The Denver Manufacturing Co.

EDITORS PRESS:—The Nichols Manufacturing Company, of Denver, have purchased the Elyrea Mill at Breckenridge, Col., consisting of 15 ordinary stamps of the old pattern, and have just shipped a new plant of machinery, the same being their own Double Giant stamps, whereby the capacity of the mill will be increased 10 tons per day. The company will do some custom work at the mill, but their chief purpose is to treat the ore of the Junco & Buffalo property, situated on the southeast slope of Gibson Hill, about a mile from town, and on which the Nichols Bros. have a lease. That the venture will prove a success there is no doubt, for in addition to being thorough and practical miners and machinists, these gentlemen have a splendid reputation for business judgment and integrity. No concern in camp have ever been so prompt in payment of their men and other liabilities, an example which might profitably be followed by a good many others.

SNAKE RIVER GOLD.—A representative of the Salt Lake Tribune has been shown, in Blackfoot, Idaho, three retorts of Snake River gold from placers two miles below that town. This gold was the product of eighteen days' operations of two men with a machine in which the gold is saved by washing over iron grizzlies and troughs covered with burlap, which fabric catches and retains the fine gold until being washed off in a tank. After this it is collected with quicksilver and then the amalgam is retorted. The product of pure gold weighed forty-six ounces, and will net over \$20 per ounce, or in all, over \$900. This makes a daily average of \$50, which is pretty good for two men. Lowell Holbrook, who is operating the placers, has shipped to the value of \$2200 this season, prior to this last lot. That sent to Boise brought \$18.75 per ounce, while lots sent to San Francisco ranged from \$18 to \$18.75, and for the same quality of gold marketed in Chicago, he has been getting \$20.50 per ounce, making the latter place much the best market for gold bullion. No other placers are being worked near Blackfoot, but at Eagle Rock some machines are operating so successfully as to yield about \$20 per day per man. As the Snake River valley contains broad and deep bars for hundreds of miles along the river, which shows many colors to the pan, mining promises to become extensive in the near future, when it is known to be profitable, and a successful process becomes generally understood.

OPERATIONS are being steadily prosecuted at Reynolds Ferry, by the Stanislaus River Mining Co. The water in the river is very low, which gives a show for working. There has been some sickness among the men, but work has not been materially retarded. The dam will be completed this week, and a new donkey engine has been received from San Francisco, which will be used to hoist gravel out of the river bed into the sluices. If nothing intervenes to prevent washing will commence in another week. Work is still being pushed in the tunnel.—Tuolumne Democrat.

NEW FINDS.—For some time past Mr. Yerrington has been prospecting on claims formerly owned by Jewell & McDonald, northwest from Soda Springs. About ten days ago some very rich strikes were made, the ore running up into the thousands of dollars per ton. What the extent of ore bodies may be is not yet known. Yerrington proposes to put five more stamps into the Garfield mill. The mine continues to turn out hullion at about the same rate as for months past.—Inyo Independent.

The Philadelphia Mining and Smelting Company is having erected at its Ketchum Works, Idaho, first-class sampling works that will have a capacity of 100 tons per day, but will be so constructed that their capacity can be increased to 200 tons per day at slight expense.

Discoveries in Calaveras County.

From a letter in the Calaveras Chronicle we make the following extracts: The Oro Fino mine is about one mile northwest of the Greve ranch. This mine is owned by the brothers William and Aaron Cook, both former residents of Mokelumne Hill, than whom no better or more enterprising men ever lived to benefit a mining camp; and we well know that all their old friends and neighbors will rejoice to hear that their indomitable industry has won its just reward and that they are to-day the owners of the largest and richest ledge of gold-bearing quartz in the county and probably in the State. It was discovered by the Cooks last summer while looking for placers near the Lava Hills, but not until some three months ago did they begin explorations. The formation of this district is porphyritic slate, and so near as we could learn it is very extensive. It is about 6 miles in width and about 18 miles in length. Its southern extremity begins near the renowned "Sheep Ranch" mine and extends northerly some 18 miles to the main Mokelumne river. It is next of the Blue mountain district some 5 miles, lying parallel thereto.

The Cooks have three locations on the vein, each location showing pay in the croppings. On the Oro Fino (the middle location) they have made their development, which consists of a vertical shaft 35 feet in depth and a crosscut at the bottom from wall to wall. This crosscut discloses a vein 23 feet in width between well-defined walls of slate and porphyry. Five feet of this vein (on the foot wall) is solid ore and very rich, average workings made show a yield of over \$100 per ton. The remaining 18 feet is mineral of a low grade. They are now sacking ten tons of the choicest ore to ship to Selby & Co. at San Francisco. The ore is not altogether free in character as it contains much galeua, hence a metallurgical process is required to extract the gold. Seepage of water makes the sinking of the shaft rather tedious. To obviate that difficulty they intend to erect a steam pump in connection with hoisting works. The "boys" feel confident they will have a million dollar mine when 100 feet depth is reached. Several capitalists and experts from San Francisco have been up to see the mine and have attempted negotiations for it, but thus far no deal has been effected. Their price at this time is \$100,000, and they propose to add \$10,000 to that price for every ten feet they sink on the vein. They know they have an extraordinary rich mine and they don't propose to fool it away.

There are many other excellent prospects in the neighborhood of the Cook's, but developments are required to determine their value. The most promising of these is the

Golden Harvest,

Located about one mile west of the Cook's. It is a recent discovery, owned by T. J. Sevrans & Co. The ledge is well defined on the surface, is about eight feet wide and yields \$100 ore. The owners seem to think that it will prove a companion bonanza to the Cook mine. As meager as are developments the owners aver that no \$100,000 ever coined could buy their "Golden Harvest." The next mine we visited was the

Fine Gold Mine,

Situated in the same belt, about three miles west from the Cook property and on the south side of the South Fork stream. This mine belongs to two French gentlemen, the Messrs. Gilman. It was discovered by them two years ago. It is a north and south fissure vein, averaging four and a half feet in width, and presenting smooth, unbroken walls wherever it is opened. The entire fissure is filled with most beautiful quartz and sulphurets. For more than a year the Gilmans have been working the ore in a small adit, getting an average yield of \$20 per ton. We were told that this property was bonded through Mr. T. J. Sevrans and Mr. Harvey to San Francisco parties for \$60,000. A remarkable feature of this vein is its great extent. Extensions are being made along the vein continuously for a distance of three miles, and in all of them the vein is found to be well defined and presenting pay quartz. We prophesy for this mine a future of prosperity and a record of production unsurpassed by any mine in the State.

The next mine we visited was the Cape Horn, owned by Mr. Fred. Greve. This mine is a north and south ledge, in slate, about four feet in width. It is situated near Allen's ranch, about two miles west of the Gilman mine. It lies between the Licking Fork and the South Fork of the Mokelumne river. It is an old discovery, work having been done and ore produced at intervals during the past twenty-five years. The explorations have, however, only been to a shallow depth, and until now no systematic plan of development has been inaugurated. Messrs. Seaman & Co. have bonDED the property of the owners and are opening the ledge to a great depth by a tunnel system of work.

From the Cape Horn mine we wended our way some six miles to the village of West Point, once the active center of vigorous mining. West Point is famous for its many quartz veins and their phenomenal richness. The ores, however, are considered very rebellious, which has been a serious obstacle to the development of the camp. Two reduction works—Russell & Co. and Symson & Co.—have been established and both have recorded a success. How-

MECHANICAL PROGRESS.

Bridge Walls and Boiler Explosions.

A correspondent of the *Age of Steel* writes, in regard to the use of "bridge walls" under boilers, as follows:

I wish to say a few words about horizontal boiler furnaces, such as are used on steamboats under stationary boilers cased with brick work.

The greater number of modern boiler furnaces are constructed with what is called a bridge wall—a wall made of either clay or brick at the aft end of the grate bars. In some furnaces these walls are built perpendicular from the grate bars, and come close to the bottom of the boilers, with the bottom of the furnace bed lower at the aft end of the boilers.

This manner of constructing a furnace, with bridge wall at end of grate bars and close to the bottom of the boiler, is, in my opinion, after thirty years' experience, the cause of fully 90 per cent of all boiler explosions, and I offer the following items of proof for the belief that is in me: Engineers in general recognize the fact that the first place a boiler will "give out," "burn," "blister" or "bag down" is right over the bridge wall. By the elevation of this bridge wall the intense heat of the grate is concentrated in volume on the plates immediately above and the water evaporated so rapidly that the plates frequently become heated beyond the limit of their strength, and give way.

Not only are bridge walls built at the aft end of the grate bars injurious and very dangerous, but also an impediment to natural draft, causing the furnace bed and flues to gather full of ashes and soot. There is a remedy for these ills. Tear out bridge walls and do not put grate bars more than 12 or 14 inches deep from the bottom of boiler. Let bottom of furnace bed be on a level with aft end of grate bars. Furnace bed should gradually rise, so that the space at the aft end of the boiler is half the depth at the aft end of the grate bars. Between back wall and aft end of boiler, in the bottom of furnace bed, should be a pit one foot deep and extending across furnace to catch ashes, the pit being right where the volume of the flame returns to go through the flues, and will surely catch all heavy ashes. The pit can be constructed with a door so as to be cleaned out at any time.

A furnace constructed on the above plan will have better draft, will equalize the heat and distribute it to all the lower boiler plate, and enable the boiler to generate more steam with less fuel than is possible with a bridge-wall furnace. Besides, burned or hag down sheets will be unknown and liability to explosion will be reduced to the minimum.

Experienced engineers well know that where the heat strikes the boiler plates with greatest force there the sediment will gather and settle, frequently in such quantity as to burn out the sheet in a very short time. To prevent sediment settling in boiler locate boiler with mud drum parallel therewith, and let the mud drum extend from aft end of grate bars to aft end of boiler, with leg connections to each sheet of the boiler. Have a cross mud drum under parallel mud drum at aft end of boiler. Let feed water come into the cross mud drum gradually, rising through these legs which are surrounded with heat, which will attract the sediment, causing it to fall back to the bottom of the drum. The sediment can be blown out of these drums at any time.

Cast-Iron Cutlery.

This title, says London *Ironmonger*, may appear anomalous, but cast iron cutlery of certain forms is far more common than its purchasers generally imagine. And it is not necessarily of a poor quality, although made of nothing but cast-iron. In the writer's family is a pair of scissors of cast-iron that has been used for three years, and that has been several times sharpened. The writer has shaved with a cast-iron razor, which did excellent work for months. There are in Connecticut two extensive establishments which reckon cast iron cutlery as among the important products of their work. This allusion to cast-iron shears and scissors does not refer to the combined cast-iron and steel articles which are usually considered superior to the forged ones. These have a steel inner plate cemented on each blade by the fused iron when it is poured into the mold; but the cast-iron shears and scissors are wholly and entirely of cast iron, and they are finished for the market precisely as they come from the molds. The quality of the iron used is the same or similar to that used in casting for malleable iron, and for cutlery it is cast in chills. When broken the crystallization is very similar to that of hardened cast steel, and, except for lack of elasticity, it serves the same general purpose. But although this cast-iron is not adapted to tools which work by blows, it is sometimes made into ice picks and axes, hatchets and steak choppers. The manufacturers of cast iron shears and scissors make no secret of the material, and sell their goods for just what they are. Of course they are sold cheaper than forged work of steel can be sold. Retailers also, know that this cheap cutlery is not steel, and usually—unless dishonest—they will truthfully answer questions.

TEMPERING STEEL WITH LOW HEATS.—Some curious statements on tempering steel are made

in a paper published in *Dingler's Polytechnic Journal*, Vol. 225, on the "Influence of Annealing Temperature upon the Strength and Constitution of Steel." Hitherto it has been generally considered that to obtain a specified degree of softness it is necessary to heat the hard steel to a particular annealing color—that is to say, to a definite temperature—and then allow it to rapidly cool. Thus, for example, that steel might anneal—be tempered—yellow, it had to be heated to 540°, and the supposition was formed and acted upon that it must be allowed only a momentary subjection to this temperature. Herr Jarolimiek says the requisite temper which is obtained by momentarily raising the temperature to a particular degree, can also be acquired by subjecting the steel for a longer time to a much lower temperature. For example, the temper which the annealing color—yellow—indicates can be obtained by exposing the hard steel for ten hours to 265° deg. of heat; in other words, by placing it in water rather above the boiling point.

WIRE-BUILT VS. ORDINARY CANNON.—Siege guns, built of wire, are the newest description of ordnance adopted for the English service. A very tough steel wire is used, having a breaking strain of 100 tons to the square inch, which is wound over a steel tube as tape may be wound on a reel, being frequently fastened off to secure its cohesion, and so neatly put together as to look precisely like solid metal. An experimental howitzer has been made upon this principle, and passed a satisfactory proof at the royal arsenal. It has a caliber of 10 inches, but weighs only about 70 hundredweight. In its trial this howitzer threw a shell of 360 pounds with a charge of 28 pounds, and attained a velocity of 1000 feet per second. The trial weapon seems in no way impaired by the strain to which it has been subjected, and although there will probably be some mistrust in setting so light a gun to fire projectiles which have heretofore been assigned to monsters of over 20 tons, it is thought that they may be safely used with such small charges as are necessary to "lob" large shells into beleaguered places, for which work only sufficient velocity for a fair range will be needed by the besiegers. Another gun is, however, being built of wire for battering purposes; and, although starting on the same principle, will necessarily differ materially in details from the 10-inch howitzer.

TO TEMPER STEEL ON ONE EDGE.—Red hot lead is an excellent thing in which to heat a long plate of steel that requires softening or tempering on one edge. The steel need only to be heated at the part required, and there is little danger of the metal warping or springing. By giving sufficient time, thick portions may be heated equally with thin parts. The ends of wire springs that are to be bent or riveted may be softened for that purpose by this process, after the springs have been hardened or tempered.

LEAD-HEADED NAILS.—An improved lead-headed nail for use in putting on corrugated iron roofs has made its appearance in the English market. The shank of the nail is round and sufficiently sharp at the point to enter the wood readily, and may be driven home in the usual way. The head flattens under the blows of the hammer, or a punch may be used which will give it a conical head. The lead of the head comes in contact with the sheet-iron in such a way as to lessen the chance of leaking.

THE METAL OF THE FUTURE.—A prominent mechanical engineer says the metal of the future is aluminum, and that in a few years it will displace iron and steel and revolutionize the industrial arts. He says the world contains ten times as much of it as of iron—every clay bed being an aluminum mine. It is three times stronger than Bessemer steel, will not corrode, and the raw materials for making it are not worth \$20 a ton.

STEEL RAILROAD SLEEPERS.—Great activity is manifested in Germany in the improvement of steel sleepers—transverse and longitudinal—for railroads, and their use is extending; the transverse being generally preferred, but it does not appear proven, even with European prices for wood and steel, that there is any economy in the use of the latter for the purpose.

HARD OR SOFT STEEL FOR RAILS.—As to the relative merits of hard and soft steel rails, the latest testimony in Germany leaves the matter of wear indeterminate, with the conclusion that the wear of rails depends more upon the impurity of the steel than upon its hardness or softness—a decision in favor of soft steel, since it is unquestionably safer.

A NEW BUILDING MATERIAL.—A mixture of cork, silica and lime is coming into extensive use in Germany. It has the advantage of keeping out heat and cold, and is also claimed to be an excellent preventive of damp and defender of sound. It is substantial, light and durable, and seems to be especially adapted for ceilings and wall linings.

CEMENT FOR RESISTING STEAM.—A cement for resisting water at steam heat may be made by mixing common commercial glycerine with dry litharge into a tough dough and applying the same to the parts to be covered. This composition is said to answer very satisfactorily for uniting the joints of steam pipes.

SCIENTIFIC PROGRESS.

Immortality of Modern Thought.

(By JOSEPH LE CONTE in Science.)

It will be admitted, we think, that the tendency of modern science is materialistic. This is especially true of biology. In fact, to many the doctrine of correlation of vital with physical forces, and the doctrine of derivative origin of species, seem little short of a demonstration of materialism. Thus materialism has become a fashion of thought; but, like all fashions, it has run into excess, which must be followed by reaction. We believe the reaction has already commenced. Science sees now, more clearly than ever before, its own limits. It acknowledges its impotence to bridge the chasm between the physical and the psychical. We pass from physical to chemical, and from chemical to vital, without break. All is motion, and nothing more; also, in the region of the vital, we pass from sense-impression through nerve-thrill to brain changes, and still we find only motions. But when, just here, there emerge consciousness, thought, will, the relation of these to brain changes is just as unimaginable as the appearance of the genie when Aladdin's lamp is rubbed.

It is impossible to emphasize this point too strongly. Suppose a living brain be exposed to an observer with infinitely perfect senses. Such an observer would see, could see, only molecular movements. But the subject knows nothing of all this. His experiences are of a totally different order, viz., consciousness, thought, etc. Viewed from the outside, there is nothing but motions; viewed from the inside, nothing but thought, etc.—from the one side only material phenomena, from the other only psychical phenomena. May we not generalize this fact? May we not extend it to nature also? From the outside we find nothing but motion. On the inside there must be consciousness, thought, etc.—in a word, God. To bridge this chasm, whether in nature or in the brain, science is impotent. As to what is on the other side of material phenomena, she is agnostic, but cannot be materialistic.

Admitting, then, in man a world of phenomena, which cannot be construed in terms of motion, and which for convenience we group under the name of "spirit," is the group permanent? Is the spirit immortal? On this subject, Science can say absolutely nothing. The field is therefore open for evidence from any quarter, and of any degree. Some of these evidences, though not given by Science, are at least suggested by lines of scientific thought. A few of these we briefly mention.

1. We have said that consciousness and thought lie behind material phenomena, in nature and in the human brain. In the one case we call it God, the divine Spirit; in the other, the spirit of man. Now, does not this identity, or similarity of relation to material phenomena, imply, or at least suggest, similarity of nature, and therefore immortality for the spirit of man?

2. Individual human life passes through its little cycle of changes, and quickly closes in death. If this be all, then for the individual, when all is done, it is precisely as if he had never been. "Yes," answers the Comtist, "for the individual, but not for humanity. Every human life leaves a residuum which enters into the life and growth of humanity. It is a glorious and unselfish religion thus to merge one's self into the only true object of worship,—humanity." But, alas! the cycle of humanity also closes; and for humanity too, when all is done, it will be precisely as if it had never been. "But the earth—the cosmos—abides." Yes, but only a little longer. Science declares that the cycle of the cosmos must also close. And then, when all is done, after all this process of evolution reaching upward to find its completion in man, after all the yearnings, hopes, struggles, triumphs of man, what is the outcome? It is precisely as if the cosmos had never been. It is all literally "a tale told by an idiot, full of sound and fury, signifying nothing." Not only heart, but reason, revolts against such a final outcome. If we believe that reason underlies the phenomena of the cosmos, we cannot accept such a result. We cannot believe that the cosmos has no intelligible end. But what intelligible end is there conceivable, unless something is finally attained which is not involved in a cycle, i. e., unless man is immortal?

3. There are three primary divisions of our psychical nature, viz., sense, intellect and will. There are three corresponding processes in making a complete rational philosophy, viz., (1) intreating off impressions of the external world through the senses (facts); (2) elaboration of these into a consistent whole by the intellect (knowledge); (3) outgoing of this knowledge in activity (conduct). Now, a true working theory of life must satisfy all these. But scientific men are inclined to think that only (1) and (2) are necessary; that true facts elaborated into consistent theory is all we need care for. Theologians, on the contrary, seem to think only (2) and (3) necessary: they elaborate a theory of life consistent with itself, and apparently satisfactory in its application to conduct, but are less careful to test its harmony with facts derived from the sense. But all three are necessary. The first furnishes material; the second constructs the building; the third tests its suitability for human habitation. All admit that successful application to art is the

best test of true theory. But conduct is the art corresponding to our theory of life, and therefore the test of its truth. Now, is not immortality as an element of our theory of life in the highest degree conducive of right conduct? Is it not a useful, yea a necessary, element in a working hypothesis?

4. But it may be objected, animals, too, have brains; in them, too, we find evidences of something like consciousness and thought. Are they, too, immortal? If so, where shall we stop? We pass down by sliding scale, without break, to the lowest verge of life. Shall we stop here? No: for vital is transmutable into physical forces. There all is immortal, or none. Thus, hope of immortality vanishes, as it were, by evaporation.

This objection, though serious, is, we think, not fatal. To make our view clear, we use an illustration taken from biology. May we not imagine that in animals spirit is in embryo in the womb of Nature, unconscious of self, and incapable of independent life; and that in man it came to birth—a separate spirit—individual, conscious of self, and capable of independent life, on a new and higher plane? According to this view, geological time is the period of gestation, evolution is the process of development, and the appearance of man the act of birth.

Variable Stars.

There are some stars that exhibit periodical changes in brightness, and for this reason are called variable stars. More than a hundred such stars are now known to be variable to a greater or less extent, the periods in some cases embracing a few days, in others many years. The variation in most of these stars is slight, and only a practised eye can detect it. But there are two stars in which the variation is so marked that it may be seen by an intelligent observer. The stars are Algol and Mira. Algol is in the constellation Perseus. It alternates from the second to the fourth magnitude in a little less than three days. For two days and fourteen hours it is of the second magnitude, the succeeding six hours and three-quarters it decreases to a star of the fourth magnitude, and then returns to the second, after which the same process is repeated. The observers of ancient times called this star the Winking Eye and the Demon, on account of the changes they detected but could not comprehend.

Mira, the Wonderful, in the Whale, is a still more remarkable variable. During most of the time the star is invisible to the naked eye. But, at intervals of eleven months, it shines in the heavens with the brilliancy of a star of the second magnitude. It retains this bright phase for about fourteen days, then for about two months gradually grows dim until it fades into invisibility.

The most interesting member of the class is our own sun, a variable with a period of about eleven years. We know that in the case of the sun the variation in brightness is caused by the immense spots sometimes covering millions of square miles that are at times found on his disk. We infer that the same reason may cause other variables to present similar appearances.

Astronomers living on some planet circling around one of the nearest fixed stars—for they are all suns—may thus classify our glorious orb: "Star of the third or fourth magnitude; variable, with a period of about eleven years; color, yellow." It is difficult to imagine the King of Day, reduced to a shining point, only one of the eighteen million suns that form the Milky Way!

TOUGHENED GLASS IN THE LABORATORY.—The results of eleven months' use of toughened glass beakers are thus summarized by Mr. K. F. Friswell, in a paper read before the Chemical Society: "Of 20 beakers, two burst spontaneously, = 10 per cent; one burst on hot water being poured in, = 5 per cent; six became useless from fissures and enfoliation, = 30 per cent; eight are in good condition, = 40 per cent; three have been broken by unknown means, = 15 per cent. Taking into consideration the loss of confidence caused by the high percentage of spontaneous bursting, it may be said that toughened glass is a complete failure in the laboratory."

IS THE SUN BLUE?—Prof. Langley, of Alleghany College, Pa., in his late interesting address before the Royal Institution of Great Britain, in alluding to the effect of the atmosphere on the color of the sun remarked that he had "years ago conceived that the color of the sun must be blue, and would so appear were it not for the thick covering of atmosphere which envelops the earth and changes the color of our luminary from blue to golden yellow." The professor also concludes that but for the power of the atmosphere to hold the heat of the sun like a great blanket the world would become utterly uninhabitable.

CEMENT FOR RESISTING SULPHURIC ACID.—A cement for resisting sulphuric acid even at boiling heat may be made by melting caoutchouc at a gentle heat and adding, with constant stirring, from six to eight per cent of tallow. Then mix therewith enough dry slacked lime to make the whole the consistency of soft paste; finally add thereto about 20 per cent of red lead, whereby the mass immediately sets hard and dry. A solution of caoutchouc in twice its weight of linseed oil, aided by beating and the addition of an equal weight of pipe-clay, yields a plastic mass which will likewise resist most acids.

TABLE OF CONTENTS.

EDITORIALS.—Dillenburg's Pipe Couplings; Copper and Lead Smelting in Australia; Cable Roads; The V. Notch Watch Gauge, 161. Passing Events; Our Ship Building Interests; Talc; Copper; Foundry Notes, 164. The Rickard Patent Oxidizing Furnace; Auriferous Gravels in Placer County, 65.

ILLUSTRATIONS.—Dillenburg's Improved Coupling; Gauge for Measuring Water, 161. Map Showing Auriferous Gravels of Placer County, 165.

CORRESPONDENCE.—Northern Arizona Mines; The Denver Manufacturing Co., 162.

MECHANICAL PROGRESS.—Bridge Walls and Boiler Explosions; Cast Iron Outlets; Tempering Steel with Low Heats; Wire-bulk vs. Ordinary Cannon; To Temper Steel on One Edge; Lead-headed Nails; The Metal of the Future; Steel Railroad Sleepers; Hard or Soft Steel for Rails; A New Building Material; Cement for Resisting Steam, 163.

SCIENTIFIC PROGRESS.—Immortality of Modern Thought; Variable Stars; Toughened Glass in the Laboratory; Is the Sun Blue; Cement for Resisting Sulphuric Acid, 163.

ENGINEERING NOTES.—Bridges; The Baltic Ship Canal; An Elevated Railway for Montreal; Telegraph Lines; Cable Roads for New York, 167.

USEFUL INFORMATION.—Durability of White Lead; Two Towers; A New Use for Asbestos; Rectifying Rancid Oil; Durability of Paper Water Pipes; Calling for Industrial Schools; The Gulf Stream; Another Premium; Finding the Length of Axes; The Stereoscope Not New, 167.

GOOD HEALTH.—Sunstroke or Thermic Fever; The Sexes; The Art of Rising Early; Office-Seeking a Disease; Appetite; Machine Shop Dust in the Lungs, 167.

MISCELLANEOUS.—Discoveries in Calaveras County, 162. Mechanics' Institute Fair; Management of Mines at Butte, 166.

MINING SUMMARY.—From the various counties of California, Nevada, Arizona, Montana, New Mexico, Oregon, and Utah, 168-69.

MINING STOCK MARKET.—Sales at the San Francisco Stock Board, Notices of Meetings, Assessments, Dividends, and Bullion Shipments, 172.

Passing Events.

The season is now so far advanced that placer work and what little hydraulic mining has been going on has been stopped. The reason has been a poor one, as the water has seldom been lower in most of the streams of the State.

* The lead market seems to be in a state of fluctuation, but the tendency is upward, after a long period of depression. Those who hold good sized lots of lead are much encouraged, and the owners of mines, which have been run without profit for a long time, now look for ward to a season of prosperity again.

The Pine Creek mines, in Oregon, are attracting considerable attention just now, and many miners are now going there. Some of the prospects found are panning out well, but the signs are that the camp is already overcrowded.

THE MECHANICS' FAIR.—The fair is an established success and is very largely attended. The machinery exhibit is attracting more attention than usual. The Pacific Rolling Mills among other home establishments, is arranging a very complete display. Although not complete in all details there is very little more to do to make this probably the fullest exhibit of Pacific Coast industries we have ever had.

A PROPOSAL to apply workmen's insurance risks to accidents at sea, will be submitted to the next German Reichstag.

Our Ship Building Interests.

The ship building interests of this coast are more extensive than most persons imagine. Although the coast line of California and Oregon is pierced by few harbors, comparatively, those few do an extensive trade. Of course the great bulk of the foreign trade is done at San Francisco, which is the center of population and of commerce of the coast. In fact, San Francisco stands third on the list of sea ports of the Union, with regard to magnitude of tonnage entered from foreign countries.

It is but natural, therefore, that there should be a great deal of shipping owned here, and this shows a gradual increase year by year, an evidence that our vessel owners have found the business profitable. The following table exhibits the growth of the navigation in interests of the coast, showing, as it does, the tonnage of vessels belonging to California, Oregon and Washington Territory during each year from 1869 to 1884 inclusive.

Year.	California. Tons.	Oregon. Tons.	Wash'ton. Tons.	Total. Tons.
1869.....	148,776	10,972	24,827	184,575
1870.....	156,788	10,712	29,525	197,025
1871.....	133,301	9,201	24,553	167,055
1872.....	141,314	14,635	24,082	180,031
1873.....	147,866	19,828	28,279	195,973
1874.....	166,434	20,496	34,342	221,272
1875.....	181,287	23,479	34,200	238,966
1876.....	204,535	25,815	22,000	252,350
1877.....	200,076	32,373	28,927	261,376
1878.....	183,280	37,079	31,001	251,360
1879.....	200,319	38,492	29,954	268,765
1880.....	202,114	39,658	29,030	270,802
1881.....	202,907	43,501	33,018	284,426
1882.....	211,126	52,569	37,072	300,767
1883.....	230,168	52,965	43,782	326,915
1884.....	233,440	50,798	49,950	334,188

Within the past few years our whaling and fishing fleet at San Francisco has largely increased. Steam whalers have been built and equipped, and sailing vessels have been bought here for the same business. The codfishery also employs many vessels.

As far as the building of vessels is concerned, the Pacific Coast makes a rather satisfactory showing, though this industry has been for a time depressed. The following table shows the progress of ship building on this coast, as it gives the tonnage of vessels built in California, Oregon and Washington during each year ending June 30th from 1869 to 1884 inclusive.

Year.	California. Tons.	Oregon. Tons.	Wash'ton. Tons.	Total. Tons.
1869.....	11,549	1,782	2,043	15,379
1870.....	10,316	988	1,369	12,664
1871.....	2,450	2,705	169	5,324
1872.....	853	959	464	2,276
1873.....	2,987	1,648	800	5,435
1874.....	7,081	1,430	2,343	10,859
1875.....	6,748	4,498	3,184	14,430
1876.....	8,557	5,926	5,509	19,992
1877.....	4,785	4,941	2,993	12,719
1878.....	5,824	4,865	637	11,326
1879.....	3,860	6,356	966	11,182
1880.....	5,795	2,466	682	8,943
1881.....	4,556	4,331	2,531	11,418
1882.....	6,998	4,836	3,987	15,771
1883.....	9,047	3,740	3,951	16,738
1884.....	4,992	1,290	2,230	8,512
Total.....	95,396	52,761	30,609	178,766

The merchant marine of this State during the fiscal year 1884 consisted of 875 vessels, the aggregate tonnage of which amounted to 233,440 tons. There were engaged in domestic commerce 683 vessels, amounting to 116,074 tons, and in foreign commerce 192 vessels, aggregating 117,366 tons. There were 39 vessels built in this State during the fiscal year, the tonnage of which amounted to 6301 gross tons. These were all wooden vessels. This year one steel steamer was launched—our first effort in this direction. The total tonnage of vessels entered at sea ports of California from foreign countries during the fiscal year 1884 amounted to 934,430 tons; the tonnage entered at San Francisco was 95 per cent of this, the other five per cent being at other ports.

Talc.

We have received from near Colfax, Placer county, some specimens supposed to be a fine talc, and the owners of the deposit considered it a valuable find. The specimens were submitted to Mr. Henry G. Hanks, the State Mineralogist, for analysis. He pronounces the substance a foliated serpentine, allied to picroilite. It has no special value, a fact which will doubtless disappoint the locators of the deposit.

Talc is not rare in this State, having been found in various parts of it. The following localities are represented in the State Museum: Soapstone, Placer Co.; talc, seven miles from Mount Hamilton, Santa Clara Co.; talc in quartz, Yosemite gold mine, Mariposa Co.; Yuba Co.; eight feet thick, Tholmne Co.; 14 miles below San Pedro, Los Angeles Co., on the coast; Wall Rock, Maryland mine, Grass Valley, Nevada Co.; Fresno Co.; soapstone,

two miles northeast of Jackson, Amador Co.; soapstone, Stockbridge Soapstone Works, near Colfax, Placer Co.; Taylorville, Marin Co.; Soapstone mountain, Kern Co.; soapstone, Tule river, Tulare Co., cut in the form of bricks and suitable for fine bricks, Lewis, Mariposa Co.; talc, much resembling French chalk, Pine, Flat Sonoma Co.; talc foliated with chalc-pyrite, San Diego Co., near Murphy's, Calaveras Co.; Rock Island Hill, Plumas Co., and Lone Pine, Inyo Co.

Talc is also called steatite, soapstone and French chalk. The State Mineralogist describes it as a soft mineral, generally foliated, except where it occurs in rocky masses as soapstone, when it is granular or crypto-crystalline. When pure it is of a green-white or yellowish color, with a greasy or soapy feeling. It is practically infusible and is not decomposed by acids. It is usually found associated with serpentine chlorite and talcose schists, and forms an important constituent in some rocks. Talc is a hydrous silicate of magnesia and iron, sometimes containing alumina and other bases. Talc schist is an aggregation of scaly talc, with frequently quartz, feldspar, magnetite, mica and other minerals. The massive variety of talc (soapstone) is used as a fire-resisting material, in place of brick for lining stoves and furnaces. It is easily sawed into the forms required, and answers the purpose when the greatest extremes of heat are not used. The fine-grained talc is used for marking on cloth by tailors, and for dusting into tight shoes and gloves. It is used to some extent as an anti-friction material, and in the manufacture of paper.

Steatite is used to some extent for boiler felt and for fire-proof paint. It can be employed for a variety of purposes, such as soap-making, dressing leather, gloves, etc. In the Eastern States about 30,000 tons a year are mined, worth about \$12 per ton. Some \$20,000 worth of the mineral is also imported into this country annually from Italy, Austria and France. The principal producing center in this country is Pennsylvania.

Copper.

The low price of copper does not, of course, affect only our home mines, but all those abroad as well. The effect of the depreciation on the value of copper is very apparent in the balance sheets of two of the largest foreign producers, recently issued—the Cape Copper Company and the Quebrada Copper Company. The net profit of the Cape Copper Company for the year 1884 shows a diminution, as compared with that of 1883, of £76,246, and with that of 1882 of £108,100, being £60,688 on 19,400 tons of 29½ per cent ore, or 5674 tons fine copper produced. The average price realized in 1884 was 9s. 3d.; in 1883, 11s. 11d., and in 1882, 13s. 2d. per unit, the value now being 8s. 3d. The cost of production in 1884 was 7s. 1½d. per unit, against 8s. 0½d. in 1883.

The accounts of the Quebrada Company show a loss of £30,953 on last year's working, or £7 15s. per ton of copper produced, viz., 4000 tons. The directors of both of these companies have decided to curtail their production.

There has lately been a notable falling off in the production of copper both in Arizona and Montana. The import into Liverpool of copper from the United States for the month of July has been only 1282 tons fine, against an average of 2787 tons per month for the previous three months, while into France it was 745 tons in July, against an average of 960 tons in the previous quarter.

The result of the low prices paid by English smelters for furnace material, in comparison with the value of Chili bars, is seen in the almost entire cessation of shipments of regulus from Chili, smelters there having found it more profitable to ship their copper produce as bars and ingots rather than in the form of ore and regulus. Furnace material is now becoming scarce, and commands relatively higher prices than were obtainable a short time ago.

The statistics for the half year show an increased English consumption of 5818 tons of copper, but a decreased export of 4539 tons. In the French consumption there is little change. Imports into England and France were 12,432 tons more than in 1881, but stocks increased only 5254 tons. Stocks now on hand in Liverpool and Swansea are 32,240 tons fine copper.

The increase of the copper business of this

country is well shown by the figures of the imports into Liverpool and Swansea for the first seven months of the year. For the first seven months of 1882 we sent there only 301 tons; same period in 1883, 3948 tons; same period in 1884, 7846 tons, and same period this year 14,553 tons. This shows a wonderful increase in export of fine copper. Chili sent to the same places the first seven months this year, 18,452 tons, so we are ahead of all other countries except Chili.

James Lewis & Sons, of Liverpool, compile some very interesting statistics of the copper market for the first six months of the year, which show the following results: Imports into England, 66,088 tons fine; exports from England, 29,752 tons; British production, 1100 tons; English home consumption, 32,425 tons; imports of all kinds into France, 8592 tons; exports of English copper to France, 1674 tons; French consumption of copper imported direct, 8336 tons; French consumption of English copper and of copper imported direct, 11,010 tons; English consumption and French consumption of copper imported direct and from England, 42,448 tons; English consumption, English exports and French consumption of copper imported direct, 70,526 tons.

Foundry Notes.

The Pacific Rolling Mills.

While the Pacific Rolling Mills at the Potrero are not employing as many men as they usually do, there is some considerable work going on, especially in steel-making. They are working on some 400 or 500 tons of steel angles for the new dry dock of the Union Iron Works. They are about to cast a 5000 pound steel cylinder for Gharadelli & Co. Steel cylinders weighing 21,000 pounds have already been cast for the California Oil Works. These cylinders are made for pressing oils from castor beans, cocoanuts, etc., and are made to stand a pressure of 7000 pounds to the square inch. With the iron cylinders made for this purpose considerable trouble from breakage has been experienced, but by making them of steel they are reduced in weight 25 to 30 per cent, and can be worked under any desirable pressure.

The mills are also making very fine steel cams and tappets for quartz mills, gears, pinions, plow-shares, cable railway grips, etc. They find a great demand for all kinds of steel articles, and in fact intend enlarging the steel foundry to accommodate orders. It seems as if everybody wanted steel to the exclusion of iron. The demand is much greater than was expected. The output of the mills is 35 tons of steel a day, of which from one to five tons are in the form of castings. Two castings a day are made. Shoes, dies, etc., are made in the mornings and other work in the afternoon. The molds take about three days to dry, a peculiar preparation being used. The steel works are run entirely by gas furnaces, which are found very efficient, in fact no more furnaces will be built except those in which gas is used. The higher the price of coal the more economical are the gas furnaces.

A lot of rails are being made at the mills for the San Gabriel Valley railroad, near Los Angeles. They have also the contract to build the outer end of the California Street Railroad, on which they have been at work for a few months. The Rolling Mills Company do the whole work under specifications, make the yokes, concrete work, adjust tracks, excavate, pave and all, the railroad company paying a lump sum. A peculiar point in the contract is that the road must be kept running all the time. All this outer end of the road was built in a temporary way, and the new work is to put it in first-class shape, like the other end of the road. Therefore the cable cars have to be kept running while the rebuilding is being done. A mechanical mixer is used for the concrete, which is not shoveled or handled at all, the mixed material falling into the carts which are kept moving to and fro between the mixer and the section on which they are at work.

This is the first roadbed ever built while the cars were running, but the Rolling Mills Company are making a good job of it, notwithstanding the difficulties experienced.

A fine exhibit of products of the mill is being made at the Mechanics' Fair. It is nearly complete, and shows a great variety of articles.

BUTTE, Montana, claims a population of 14,000.

The Rickard Patent Oxidizing Furnace.

This furnace was designed and erected in Maidanpek, Servia, in 1876, with a view of reducing the cost of calcining the low grade (2½ per cent) copper ores (pyritous with about 15 per cent sulphur) of the Servian Copper and Iron Co., the ordinary reverberatory having been found too slow and expensive.

After a successful run of some months, and the difficulties of the operation had been surmounted, the following vote of thanks was passed at a board meeting of the company and forwarded to the inventor.

Maidanpek, Servia, July 10, 1876.

W. T. Rickard, Esq.—DEAR SIR: I am directed by the Board of the Servian Copper and Iron Co. to convey their thanks to you for your skill and energy in bringing into successful operation a process for the reduction of the ores of Maidanpek. I remain, dear sir, yours sincerely,

BRENTON SYMONS, Resident Director.

The grand defects in the old reverberatory consist in the time required to oxidize or burn off the sulphur, the air or oxidizing agent having to pass through the fireplace where it is deprived of the greater part of its oxygen before it can attack the sulphur; and the amount of hard labor required to rake and turn over the charge from time to time, in order to expose fresh surfaces to the oxidizing action of the air.

New, as sulphur requires its own weight of oxygen, and iron 30 per cent, to convert the former into sulphurous acid gas, and the latter into peroxide, it follows that a minimum of 130 per cent of oxygen must be introduced before these results can be obtained; and, as a cubic foot of air contains but one-fourth of an ounce of oxygen, it is obvious that an enormous volume of air must pass through the furnace before perfect calcination can be secured; and as only the excess of air passing through the ignited and oxidizing fuel, as applied in the ordinary reverberatory furnace, is available, the operation is necessarily slow, tedious, expensive and unsatisfactory in the extreme.

This difficulty has been completely overcome in the "Rickard" furnace by supplying it with a strong current of pure, hot air (in addition to that passing through the fireplace) which burns off the sulphur with great rapidity, and at the same time, by means of the force with which it is injected, keeps the charge in motion, presenting continually fresh surfaces for oxidation and thereby dispensing (except in discharging) with the expensive and laborious process of raking, so indispensable in the old reverberatory.

This hot air is supplied without any additional cost for fuel, from a pan or any other good blower, and brought up to the temperature of the furnace by passing it through the fire bridge and flues bordering the hearth till it reaches its discharge outlet in the throat, where it encounters the powdered ore as it is continuously introduced at the rate of 30 lbs per minute, or 1800 lbs per hour (more or less, according to the amount of sulphur to be got rid of) by means of a screw working in an external hopper, the amount of ore introduced being regulated by the speed of the screw.

The oxygen of this heated air, uncontaminated by the products of combustion thus introduced in excess of the requirements of the sulphur and iron, instantly attacks the finely divided sulphuretted ore presented to it, and carries off the sulphur as sulphurous acid gas, the lighter portions of the ore being carried by the force of the blast into the upper hearths of the furnace and from thence to numerous dust

chambers prepared for its reception, the number of which can be regulated by the character of the ore to be operated on. A little water sprinkled into the last one will prevent any less through the chimney. The ore collected in these chambers is the most thoroughly roasted, coming out almost, if not quite free from sulphur, or "sweet," as it is technically termed. Ten to 30 per cent of the ore will find its way into these chambers. Thus one frequent objection, viz., loss of dust, is made a prominently successful feature of this new arrangement.

The heavier portion falls on the bottom hearth, where it is attacked by supplementary blasts of hot air from the side flues and fire bridge, which keeps it in constant motion and prevents agglutination while the sulphur is being carried off.

As the charge is ready for discharging every half hour, there is never more than about half a ton on the hearths at a time, thus affording room enough for a thorough motion of the particles and consequent oxidation. The discharge is effected in the customary manner, by raking through openings from one level to another.

A high degree of heat is thus developed by the rapid combustion of the sulphur and iron

of wood in 24 hours, at \$1 a cord—\$14. Labor, four men, at \$3—\$12, or, in all, \$26, and calcines 10 tons imperfectly (leaving 10 to 15 per cent sulphur behind)—\$2.60 per ton.

The "Rickard" will burn but two and a half cords of wood—\$10. Labor, four men at \$3—\$12, or, \$22 in all, and calcines 20 tons perfectly—\$1.20 per ton, being a direct saving of \$1.40 per ton, in addition to the gain effected in the production of a higher grade of matte or black copper, which may be estimated at 16 per cent and would be saved in freight to market. When it is considered that some of our large copper works are calcining several hundreds tons of ore per day, the saving to be effected by the introduction of this furnace of Mr. Rickard's is obvious, and the present low price of copper should, we imagine, induce all engaged in this business to examine into the economical advantages claimed for it.

The tailings of Grass Valley might also be very advantageously treated by this method. Although patented in 1879 through the agency of the MINING AND SCIENTIFIC PRESS, the furnace has not yet been introduced into this country in consequence of its inventor's other engagements having prevented him giving it his per-

canyon of the North Fork of the American river on the south.

The mining towns of Gold Run and Dutch Flat, and the extensive placer mines in their vicinity, are on this "divide," which is traversed by the railroad. Between the North Fork of the American river and Shirt-tail canyon is the Iowa Hill "divide," and between Shirt-tail canyon and the Middle Fork of the American river is the Forest Hill "divide." These two unite above the sources of Shirt-tail canyon, and together with several smaller and less important divides, joining on the south, where they lie between tributaries of the Middle Fork of the American river, and form one main ridge, which runs far toward the summit of the mountain, and is known as the "Forks House divide."

In the lower foothills the country rock is granite. Shallow auriferous placers have been worked extensively all over this granite section, but are now entirely worked out and abandoned.

There is also one range of deep gravels, in some places capped with lava, commencing at a point about one mile west of Auburn and running thence southwesterly to a point about 12 miles southwest of Rocklin. These deep grav-

els seem to be the detritus of a very large dead river. They have been prospected and have been worked by drifting and hydraulicking at several points to be referred to farther on.

On the summits of the ridges, between the canyons, are found the remains of at least two great trachytic lava flows, varying from a few feet to several hundred in depth. In some places the lava has been entirely eroded off, while others it seems never to have covered.

Lying between the slate and lava, and in some instances between two lava flows are found the gravelly detritus of ancient buried river systems, varying from a few inches to 300, and

even 400 feet in depth. These gravels are more or less auriferous, and have produced the greater portion of the gold yield of the county. The auriferous gravels, both as regards extent and richness, are found concentrated in lines of depression in the underlying country or bed rock, as it is termed by the miners. These depressions are evidently old river channels, which, as a more correct knowledge of them is gained, seem to have been made by streams larger than those at present flowing through these grounds. Occasional quartz lodes are found, but the general character of the mines is placer.

The accompanying map of a portion of this placer mining district from the Mint Directors' report will give a better idea of the relative position of the mining claims and the boundaries and extent of the gravel deposits. The shaded portions show the limits of the lava flow.

The Oakland Express is a new evening paper published at Oakland, Alameda county. Dr. W. W. McKaig and Mr. Allum are the principal conductors of the journal. Its typographical appearance is excellent, and the contents bright and newsy. Dr. McKaig is an experienced editor, and knows what the Oakland people want, so the enterprise can hardly be other than successful.

ARRANGEMENTS are being made to start up the ten stamp mill at Bristol, Nev. During the first month the mill will be run on tailings, of which the company have quite a pile, after which it will work on ore from the Mayflower mine, a few miles distant from the town.

PLACER and hydraulic mining is at an end for this season.

(which is not available by the slow combustion of the old reverberatory), and thereby a very considerable saving of carbonaceous fuel is effected, the operation approximating, in fact, to that of the "Hollway" patent, by which, under certain conditions, the sulphur and iron of the ore or matte are the only fuels used. This beautiful process has, after many failures, been recently brought to a successful issue at "Parrott Copper Works," Butte, Montana, in connection with the Bessemer converter. The large amount of oxygen thrown in by the blower also burns up every atom of carbonaceous fuel used in the fire place. It is claimed that no loss of fuel can possibly take place, the extensive dust chambers utilizing all waste heat before it reaches the chimney. In practice it was found that two and a half cords of wood was sufficient to calcine 20 tons of ore with 15 per cent sulphur nearly to sweetness in 24 hours.

Speed, economy and efficiency having been the objects in view, everything in the way of complicated machinery has been carefully avoided, and old ideas of proved success retained as far as possible, the furnace being, in fact, nothing more than a modified reverberatory with hot blast and dust chambers so arranged as to produce the maximum chemical results with a minimum expenditure of fuel and labor.

The advantages derived from its use may be seen in a comparison of its results with those of the common reverberatory at present in use at some of our largest copper reduction works. The reverberatory burns three and a half cords

sonal attention. He is at present in Anaconda, Montana, and will be glad to communicate with parties desirous of using it.

Auriferous Gravels in Placer County.

The placer mines of this county were among the earliest discovered and worked in this State, and in permanence, richness and gross aggregate of yield in the years since they were first operated they compare well with the mines of any other section of the State.

Placer county is peculiarly well situated for the development of deposits of its precious metals. The old overland emigrant road crosses the summit of the Sierras in the eastern portion of the county, and descending toward the Sacramento valley crosses the higher deposits of deep gravel that form the great drift and hydraulic mines, and then on to the lower foothills, reaching the extensive shallow placers worked by the more primitive mining methods. The main line of the Central Pacific Railroad runs through the county, rendering the greater portion of the mining districts directly accessible. Comparatively short wagon roads from the railroad towns give communication with other mining sections.

The western part of the mining section consists of low rolling hills, intersected by numerous ravines and narrow valleys, lying between Bear river on the north and American river on the south, the highest elevation not exceeding 1500 feet. The northern of these ridges, or "divides," as they are locally termed, lies between Bear river canyon on the north and the

Mechanics' Institute Fair.

Lack of space prevented, in our last issue, the publication of the address of Henry C. Dibble, at the opening exercises of the Mechanics' Institute Fair, but we now give it, as it is well worthy of perusal:

MR. PRESIDENT, LADIES AND GENTLEMEN: The annual Industrial Exhibitions of the Mechanics' Institute of San Francisco are intimately identified with the marvelous growth and phenomenal development of California. A collection of the reports of these exhibitions, running through twenty years, would form ample material for a history of the industrial and mechanical progress of the State for more than half the period of its existence as a commonwealth. It is not surprising, therefore, that the enthusiastic and energetic people of this city and vicinity, as well as many from a distance, should regard this fair with warm sentiments of affection. That they do so is not only evinced by the hearty co-operation of the public press, but also by the generous support given to the Mechanics' Institute, in aid of this beneficent enterprise, by the intelligent industrial classes of San Francisco and surrounding country. This generous support, which is shown by the annually increasing number of visitors, has yielded its golden harvest to the institute and has enabled it to yearly improve the exhibitions by furnishing better facilities to exhibitors by more extended advertisements, by adding to the lists of premiums, by offering new attractions and by numerous other devices which the worthy Board of Managers so clearly understand.

And so, year after year, the mechanical and industrial classes and all the good people of our State who are interested in its material prosperity, have had opened to them an annual exchange, as it were, of its industrial and mechanical resources. Here at this fair, each year, the manufacturers, merchants, inventors, artists, machinists and skilled laborers of all grades have been enabled to meet and take note of the further progress which may have been achieved in the line in which each, respectively, is most interested; and, bringing their own wares and work, they have entered the generous rivalry offered by the premium lists, as to the superiority of their manufactured products or handicraft. What higher commendation could any industrial institution receive than the expressed desire of the manufacturers and mechanics to obtain its certificates of "Best." And, taking a broader view for a moment, what incalculable good to the whole State must result from the better work of the manufacturers and artisans in their efforts to excel each other.

Character of The Opening Exercises.

The opening of the fair, has, according to the custom of the country been made a day of ceremony, and the observance of this custom by the institute has served to enrich its records. The printed annual reports during the years past, contain many interesting, instructive and eloquent discourses delivered on opening days. These discourses, thus printed in the reports of the institute, have been widely distributed and have aided in arousing a further interest in the Expositions. Many of these addresses are filled with valuable facts relating to the industrial progress of the State; with profound and philosophic discussions of great economic questions; with model disquisitions upon the dignity of labor, upon the relation of mechanical industries to the progress of civilization, and upon the sovereignty and dominion of man over nature. Indeed, in looking over the reports of the Exhibitions for only a half-dozen years past, it would seem that the subjects suitable for discussion on this occasion had been elaborately exhausted by the able and eloquent gentlemen who have spoken from this rostrum. A few years ago, for instance, a talented and much beloved citizen who is an honor to the State, and whom the people delight to honor, for they have sent him to Congress, gave a comprehensive review of the growth of the agricultural, mining and manufacturing wealth of the State, and a history of the important mechanical inventions made in California. On a more recent occasion an eminent journalist, whose vivid and graphic style is familiar to every reader on the Pacific Coast, and of whom all Californians are proud, however much they may abuse him, discoursed eloquently upon the important influence which artisan and mechanic classes have had upon the progress of society and civilization. Another, a distinguished divine, exalted the dignity of labor in such eloquent and beautiful terms, that there is nothing left to be said upon that subject. And, again, on an earlier occasion than any yet mentioned, an honored citizen of California, who has been often called to the councils of the nation, and who has served the country in high diplomatic position, in the course of an address devoted to a discussion of the dignity of artisans, as exemplified in several international expositions, laid special stress upon the advantage of these fairs as great schools of object teaching.

Thus it may be seen by a mere reference to the subjects treated by a few only of the speakers, that the speaker of to-day is left without much scope unless he should repeat. In view of these considerations, it seems necessary to devote the brief time allowed to an examination of one or two general laws whose operations are to be observed in the progress and development of social life and industrial prosperity.

A Study of Human Nature.

In one of the addresses mentioned, delivered from this platform, the orator said: "The tendency of modern civilization is to honor the inventive worker and to bestow upon him the praise heretofore reserved for the successful warrior." Without doubt, this is the current belief as expressed by public men of the day, and in modern literature. And yet, the magnificent procession of sorrow which was witnessed in New York a few days ago at the burial of a great soldier; which was repeated across the continent and here at this Golden Gate on a smaller scale, but with no less sincerity or solemnity—the profound and universal sorrow thus expressed by the American people over the death of their greatest general might seem to throw a doubt upon the statement quoted and the belief referred to. Has there been such a change in the world's estimate of greatness? Is it true that as modern civilization has advanced, men have come to hold a victorious soldier in no less esteem than other successful men? Is it a fact that the industrial captains of this iron age have taken the place in the hearts of the people once held by the warrior chieftains who were beloved and honored for glorious victories and patriotic deeds? These inquiries present an interesting study of human nature. Let us pursue it a moment. Human nature is the same to-day as in the past ages; it does not change. Men are exalted and honored and revered to-day, for the same reasons as in all times past. But what is it that causes the people to follow men as their leaders; to exalt them as chieftains; to honor them above their fellows; to revere them as heroes? Is it not because such chosen few have wrought results which have been as have seemed to be of value to their race? What is hero worship but the worship of success? What is the measure of human greatness but the net product of a man's life valued by his fellow men? And the world has always delighted to honor men who have achieved greatness, whether as soldiers, as statesmen, as builders of cities, as teachers of philosophy, as poets, as musicians, as painters, as sculptors and yet no less as artisans. Stephenson and Watt, and Fulton, and Arkwright were esteemed and honored by the world for the same reasons that Fabius Maximus was honored by ancient Rome, that Count Cavour is esteemed by modern Italy, that Washington and Grant are revered by their countrymen. There may seem to be exceptions to this rule: Aristides was driven from Athens. Galileo was persecuted, and the wisest and best of all times have been maligned. Grant, as Bishop Fowler said in his memorial oration, "was the best abused man of his day." But such incidents are temporary aberrations of public opinion. Aristides was recalled and named the "Just;" Galileo was honored and respected by the whole world as a great discoverer, and the character of Grant has become lovingly and indelibly impressed upon the American heart. In the end public opinion rights itself.

Evolution Determines Social and Industrial Progress.

After all is said, the heroes of any age are the products of the laws of development and growth which determine the evolution of society and the progress of civilization. It is but trite to say at this day that no one now disputes or doubts the universality of law. And it is scarcely less disputable to say that this intelligent world has now accepted the doctrine of evolution as pronounced by modern philosophy. All that in the world is, was produced under the operation of God's universal laws of growth, development and progress. This is no less true of society, in its broad and comprehensive sense, than of animal and vegetable life. Nations are the results of the law of evolution. Nations are not formed or created or established, in any proper meaning of those terms; they grow; are the results of growth, as are all other living entities.

Lawyers and philosophers of the past have talked and written about the "Social Compact," assuming the existence of an entirely fictitious and imaginary so-called natural state of society, where men have voluntarily entered into the social relation, agreeing then and there to surrender portions of their natural liberty in consideration of future protection.

This idea runs through much of English, French and American literature of the present and past centuries. It has absolutely no historical justification and is out of all harmony with the doctrine of evolution. In truth, man never existed in any other condition than in the social relation. Not that his earlier state was in that higher condition of development into nations; but the unit of all social and political movement and progress has ever been a social group. The line of social and political advancement and development is from the family and tribe to the nation. In the Divine economy of the world, the nation was designed to be the highest product of Nature's laws. It is God's plan for making greater homes for His children on this earth.

A Special View of Evolution.

There is an aspect of the law of evolution that should be here noted. Progress by evolution is ever from the homogeneous to the heterogeneous—from the simple to the complex. But the operation of this law produces an invariable resultant—that is to say, organic life. This is observable in the animal and vegetable kingdoms, but no less so in the social and political order. Thus nations are formed, and, having achieved organic life, they become self-conscious, organic beings. They develop definite tendencies and manifest specific historical purposes. As growth and progress proceed under the

operation of the law of evolution in all phases of life, there is produced what is termed a differentiation of functions—this thing is set apart to do that thing, that to do another, and so on. In the social and political order this law is manifested by the development of different callings and industrial pursuits in life, and by the segregation and distribution of the powers and duties of government. And it is to be noted that the tendency to the differentiation of functions in the process of development and in the course of progress is only limited by the necessities of the organic life which is the ultimate object and product of evolution, but that at the same time the law of differentiation of functions relates solely to such organic life and to nothing beyond.

The Nation and National Economy.

Under the operation of evolution, development and progress in the social and political order proceed, as we have seen, to the construction of the nation, which is the ultimate design of Nature and of God. In the course of such progress this law of differentiation of functions is ever operative—these men are set apart to do one thing, those to do another. We call it a division of labor. But it is not the design of this grand economy that this differentiation of functions or separation of employment should relate to the welfare of others than those who have been associated as a nation, and who are bound together by the instinct of patriotism and passion of loyalty. In a word, in God's economy for the welfare of the human race, it was designed that each nation should perfect itself and to that end should accumulate wealth for itself. And it was designed that the nation developed and constituted, as we have seen, should become a source and means of protection to its constituent members in their efforts to achieve further material and industrial progress. Up to a certain point, the law of evolution in society may be said to be unconscious in its operations, but with the attainment of organic national life, unconscious evolution gives place to conscious development, so that national protection to the industries of a country should become the defined and determined policy of the nation. And such has been and will be the policy of the American Republic.

The English school of political economy, founded by Adam Smith, which has its representatives in France and America, has claimed and claims the exclusive right to furnish the only safe rules and true methods for the production of wealth, and for the development of material prosperity throughout the world. We are told that it is the A, B, C of social science; that, in the production of wealth, the welfare of mankind demands that the law of differentiation of functions must have full and untrammelled play throughout the earth: these people should manufacture, those raise raw material, others should produce food, and so on. And here, without pausing to argue it, will suffice to say that in this proposition is found the ultimate justification of their theory.

But may it not be possible that in this very proposition lies the fallacy of the argument? May it not be possible that an understanding of the natural limit and true scope of purpose in the Divine economy, of the application of the law of differentiation of functions, already suggested, would furnish a refutation of the economic doctrine which is opposed to national protection?

Justice to Our Industrial Classes.

There are no people in our country so much interested in the maintenance of our American system of national economy as the manufacturing and artisan classes throughout the land. They are the bone and sinew of the nation. Intelligent, progressive, and intensely patriotic, they vie with each other and with their countrymen engaged in other pursuits in efforts to advance the prosperity of the country and the glory of the Republic. They help maintain the schools; they aid in the enforcement of the laws; they contribute taxes and they stand ready to bear arms in the defense of the flag. Why should they not have such protection from the nation as their just interests demand? And reciprocity of interests among the different industrial classes of the country renders it to the advantage of all that such protection should be given to each. The agriculturalist finds a sale for his products, the tradesman his opportunities, in the great manufacturing and industrial centers, which are built up through the effect of national protection.

As we contemplate the future of the Republic what a magnificent vision rises before the imagination. A nation which must soon reach in numbers a hundred millions, inhabiting a land of infinite productive power, extending from ocean to ocean, and from the frozen lakes to the sunny shores of the great gulf. A land of incalculable riches, blessed with unbounded liberty. A people enlightened by education, and inspired by a reverence for that God whose laws produce their happiness. A self-conscious nation with a defined purpose to protect its citizens in every political and civil right and privilege, and to protect the industrial classes, capitalist and laborer alike, whether against the insidious attacks of an antagonistic economic policy from England, or the dangerous encroachments of an Asiatic horde.

Nor shall there be in America less of that beautiful sentiment which, in other lands and in all ages, has led men to look up and cling to the heroic and noble characters who have arisen to lead or command, or instruct, or inspire. Who can say what shall be the ultimate fate of

this mighty Republic? That it will not be overpowered goes without saying. Whether its destiny may be demand an extension of its dominions, who can now know? That that destiny may require that it shall present itself as a barrier to some onslaught upon Christian civilization is possible. But whatever its trials, whatever its future, whatever its destiny, whatever its glory, this we know: That the man for the occasion will be found, as, when the nation's life was in danger, Grant was found.

Management of Mines at Butte.

The mines of this camp, says the Butte (M. T.) Miner, at least the majority of them, are better managed than any other mining properties in America, or even the world. If some of the old-time mining superintendents, the duds, reckless, incompetent class of men whose only experience in mining was that the properties (mis-) managed by them were owned by their rich relations and friends, if these should come to our mining camps and inspect mine workings of the present day, they would be greatly surprised and disgusted at the changes time has wrought. The magnificence of the mining superintendent has departed, and the palatial offices, fat teams and fast companions are no longer to be encountered. A mine superintendent of the present day is something more than a mere disbursing officer, and in a majority of cases is a practical miner. The last "dude" superintendents that we have heard of flourished in Nevada, the wrecked condition of the Alhion, Eureka Tunnel, Wales Consolidated, and many other mines of that unfortunate State, are

Standing Warnings

To mining companies not to place their affairs in the hands of men whose only recommendation is their ability to give a grand dinner or drive a fast team. But this class of men is not found in the average mining camp of to-day. They have been buried and the only regret is that their virtues and accomplishments were not forgotten at a much earlier date. A comfortable room in which to transact business and a comfortable team in which to scour the mountains in the interest of his company, now constitute the outfit of a mine superintendent, and

The Work of One Such

Man is more beneficial to the mining industry than the accumulated labors of his predecessors. Underground developments and the surfacing of ore in quantity is now the rule in all well regulated mining camps. Mine owners depend more upon ore showings and less upon the style of the surface improvements, and mine failures are of less frequent occurrence.

The mining companies of Butte and surrounding country are to be congratulated upon the class of men they have selected to manage their respective properties in this district. In nearly every instance they are practical miners, men who have swung the pick, twisted the drill, ran the pumps, and who know everything required for the proper working of a mine, from blasting out a piece of ground and putting in a set of timbers to hoisting a car or bucket of dirt from the bottom, to assorting a pile of ore after it is placed on the ore dump. A class of

Men of this Stamp

Are a blessing to any camp that is possessed of any real merit, and this camp to-day is greatly benefited because those old-fashioned, hard-working, far-seeing, practical miners have the control of our mining affairs.

NEW QUARTZ MILL.—The Virginia Chronicle says: Stevenson's new concentrating mill near the Morgan mine at Galena, a short distance from Steamboat Springs, was started up last Thursday. When steam was turned on, the machinery moved along smoothly, and it has been running ever since. In constructing the mill, provision was made for ten stamps, five of which are now in operation. The others will be added as soon as it has been demonstrated that the base ore of the district can be concentrated at a profit. The ore is hauled down hill from the mine, which is about half a mile distant, by one horse carts. The crushing capacity by the five stamps is 15 tons every 24 hours. D. H. Bisbee, the building contractor of the mill, has been appointed superintendent. He is a Comstock mechanic and built the mill for the Moss mine at Kinkead, on the line of the Carson and Colorado Railroad, which has been in operation several months and is said to be a fine specimen of the millwright's art. A good bullion-producing camp is likely to spring up at Galena very soon, if the present experiment proves successful, which is now considered as almost certain.

For the present everything is at a standstill at Candelaria. At hotels and restaurants most of the help is discharged, and several of the latter are closed entirely. Merchants have discharged part of their help, and are closing up accounts. Mine managers have given notice to miners that they can have till the first of next month to decide whether or not they will go to work for three dollars a day; if the miners refuse this proposition, all supplies in store at the mines will be shipped away or sold, and the mines will remain idle for an indefinite time. Many men have already left the town, and more are leaving daily.

ENGINEERING NOTES.

BRIDGES.—Probably the largest bridge ever built (without mentioning trestleworks) was the Tay bridge, 10,320 feet in length; probably the largest bridge now in use is the Montreal bridge over the St. Lawrence, 8791 feet; probably the longest bridge that will be built in a century from now is the Forth bridge, to be 9200 feet long; probably the highest bridge in the world is at Gerabit, France, crossing the river at the height of 413 feet; probably the most wonderful bridge in the world is the Brooklyn bridge, the permanent weight being 14,680 tons; probably the bridge of saddest reflections is the Bridge of Sighs; probably the bridge most celebrated in song and story is the London bridge; undoubtedly the first bridge in the world is the bridge of the nose; in which list may now be added the bridge built recently by the Erie Railway near Passaic City as the quickest built bridge in the world. A rival road had made preparations to build a bridge at the point selected by the Erie to cross the canal for its branch to Passaic, and everybody but the Erie people were astounded one morning a few weeks ago to see a fine truss bridge at the coveted place, where late the previous night there was no bridge at all. The bridge had been quietly built in Jersey City and taken in cars to the place all ready to be put up. The curiosities of bridge making would fill a large book, and who will say that the crank with a scheme for bridging the Atlantic is not a wise man born a century before his time.—*The Stockholder.*

THE BALTIC SHIP CANAL.—News comes from Berlin that the long contemplated ship canal from the Baltic, through Holstein, to the North sea, is at last likely to be made. The cost of the undertaking is estimated at nearly \$40,000,000, of which one-third is to be borne by Prussia, the remainder being distributed over the other parts of the German Empire. The Government are now engaged upon the details of a measure for the furtherance of the whole project, which is spoken of as a work of peace proper to be undertaken in a time of peace. There is already a shoal water canal between the two seas opened just a century since, with only nine feet of depth. The new ship canal will traverse a distance of 60 miles and afford a passage for the largest ships. Such a canal as the one now proposed has long been considered a great commercial necessity, as it was estimated thirty years ago that fully 30,000 vessels passed through the sound annually from sea to sea. Of course, this new commercial highway will work much damage to Denmark, which has heretofore profited largely from this traffic.

AN ELEVATED RAILWAY FOR MONTREAL.—A company has been formed in Montreal for the purpose of building an elevated railway in that city. Not only is the railway to go through the principal streets of the city, but it is also intended to run it around the mountain and to the surrounding villages. The promoters of the above have a task before them of no ordinary magnitude. It will likely be some years before it will be an accomplished fact, owing to the difficulties in the way of such an enterprise. Among the difficulties may be mentioned the disgraceful narrowness of the business and other streets, a fact which to strangers seems wonderful in such a large and wealthy city. Montreal possesses many magnificent buildings, the effect of which is almost entirely lost by this cause. If this and other difficulties are overcome, as no doubt they will through time, the railway, when constructed, will be a great boon to the city, and a remarkable contrast to the single track system, existing at present, of the City Passenger Railway.

TELEGRAPH LINES.—The United States has more than three times as many miles of telegraph line, double the number of telegraph offices, and forwards twice as many telegrams annually as any other country on the globe. Russia comes next. France, Germany, Austria and Australia rank ahead of Great Britain in miles of line, having 45,878, 45,070, 31,121 and 27,831 miles respectively, though Great Britain, with 31,345,861 telegrams forwarded, sends a few more than one-half the number sent last year in the United States.

CABLE ROADS FOR NEW YORK.—A large organization has been effected to build about seventy miles of cable roads in New York City—the first six miles of which has just been completed and put in operation. It is said that 100,000 tons of steel and iron would be required, and that it would take two years to complete the lines. The capital of the Cable Company is \$42,000,000, and will, it is said, be all expended in the work of construction.

THE RAILROAD SYSTEM OF JAPAN has attained a length of 225 miles and is increasing steadily. It has been mainly built by the Japanese Government with native capital. The business results up to the present time have given no cause for dissatisfaction.

PORTABLE RAILWAYS ON STEAMERS.—A novel use has been found in England for portable railways, and they are now laid upon the decks of steamers while in port, to aid in moving coals and cargo.

USEFUL INFORMATION.

Durability of White Lead.

Why is it that white lead does not wear as well as it used to? is a question that is frequently asked by painters and consumers. They also add: We used to be able to obtain an article that would wear for years, while now its durability is much less. The important reason for this is found in the difference between the methods of manufacture employed now and a few years ago. Formerly, white lead was corroded by immersing it in vinegar acidulated with acetic acid, which is only concentrated vinegar. The process required about eight weeks before the carbonate was ready for use. This process, however, was found too costly, and the production was too limited to supply the demands. Then, too, a process requiring so long a time would compel corrodors to invest a large capital from which they could realize no return for a long period. They could not afford to produce lead in this manner at a cost sufficiently low to meet the demand for a low priced article. Accordingly their ingenuity was taxed to invent some method whereby the carbonate could be produced much quicker and at a much less price. Thus they adopted the present process whereby the lead is now corroded by means of a stronger acid in a month, or even in a few days. The result is that the pure article is much less durable when applied to buildings. Speed in the manufacture of some articles, it is true, does not sacrifice quality, while in others the greater celerity in manufacture the less durable the products. Not only is this seen in the production of lead, but another branch of manufacture where it is especially noticeable is that of leather. Formerly it required 15 months to thoroughly tan a hide. Now the process has been shortened and a month and a half at the longest witnesses the completion of the work. As in the case of white lead, the result is lack of durability, and people constantly complain that leather soon cracks out and lacks its original durability.—*The Painter.*

TWO TOWERS.—"The Center of Civilization"—Paris—is to have two gigantic towers. One, the first projected, will be used as a sort of place of resort, where, for a small sum, an elevated view can be obtained of the great city and its surroundings. The other will be more especially devoted to scientific purposes. For this latter M. J. Bourdais has presented to the French Society of Civil Engineers a project for the erection of a masonry tower 984 feet in height. After an examination of the different geometric profiles realizable, M. Bourdais has adopted the column as being more apt than any other form to satisfy the rules of aesthetics, and as also being the most stable. In fact, the highest chimney in the world—that of St. Rollox, near Glasgow, 433 feet in height—has been submitted to numerous storms without suffering from them, and as other chimneys exposed to great wind pressure have never given rise to any accident, it would seem that a cylindrical form is the one that should be adopted. M. Bourdais' structure would consist of a base 216 feet high, in which is to be established a permanent museum of electricity. Above this would rise a six-storied column, surmounted by a roof, forming a promenade and capable of accommodating 2000 persons. The central granite core, 60 feet in diameter, would be surrounded with an ornamental framework of iron faced with copper. This would be divided into six stories, each containing sixteen rooms, 16 feet in height and 50 feet square, designed for aerotherapeutic treatment.

A NEW USE FOR ASBESTOS.—In the processes connected with dyeing and printing of cotton cloth it is frequently necessary to hang the fabric in loops from parallel rods for the purpose of exposure to steam, air or ammonia. In order that the cloth should hold upon the rods without slipping or being strained, it is necessary to wind rope of strips or cloth around the rods, but this only mitigates the difficulty without accomplishing its removal, for the heat and corrosive action of the vapors rot any covering in a few weeks, and the first notice of any deterioration is generally the appearance of small pieces of roll covering among the cloth in process of finishing. Recently asbestos rope and asbestos cloth has been used for this purpose, and proves to be very durable. Larger ropes of this refractory material have been used for the transmission of power over places exposed to heat.

RECTIFYING RANCID OIL.—Oil which has become rancid, or which contains impurities, can be rectified, according to Viallis, by being filtered through charcoal which has been soaked with a soda solution. For large quantities casks can be used for this purpose whose bottoms have been perforated. The bottom of the cask is covered with flannel, and over this a layer of impregnated charcoal, 20 centimeters thick, is placed, to which another layer of animal charcoal may be added if the oil has to be rendered colorless. The oil becomes pure after passing through two or three such casks.

DURABILITY OF PAPER WATER PIPES.—Water pipes made of paper have stood the test of practical application remarkably well. Dr. D. Lewis says that some years ago he laid 1000 feet of paper pipe, two inches in diameter, to convey water from a spring to his house and

harn in the country. It has never leaked, and has never imparted any perceptible taste to the water. This pipe is made of strong paper wound into pipe form, and thoroughly soaked with tar. It becomes so hard and strong that it will bear a pressure almost equal to iron.

CALLING FOR INDUSTRIAL SCHOOLS.—The Southerners are calling for the organization of industrial schools. With all their fine forests they say they are making out of their wood nothing but logs and boards. They ship lumber north and buy much of it back in the shape of staves, handles and shuttle and bobbin blocks. They sell walnut logs for \$50 and buy them back in boards for \$200. The same is largely true of iron and many other materials.

THE GULF STREAM.—From recent observations, Captain Pillsbury finds that the strength of current of the Gulf Stream is invariably on the Florida, instead of the Bahama side of the stream. He has found the temperature of the stream to range from 42 degrees to 81 degrees. The greatest velocity of the stream at the surface is about 4½ knots, but the fluctuations are frequent and great.

SOFT SOAP. with half its weight of pearlash, one ounce of mixture in about one gallon of boiling water. This is in every-day use in most engineers' shops in the drip-cans used for turning long articles bright in wrought-iron and steel. The work, though constantly moist, does not rust, and bright nuts are immersed in it for days till wanted and retain their polish.

ANOTHER PREMIUM.—The National Planters' Association proposes to raise, through voluntary donations from the planting, manufacturing and commercial interests, \$200,000, to be offered two years hence in various premiums for the development and improvements of farms and of the implements and machinery used in their cultivation.

A SOLUTION OF INDIA RUBBER in benzine has been used for years as a coating for steel, iron and lead, and has been found a simple means of keeping them from oxidizing. It can be easily applied with a brush, and is easily rubbed off. It should be made about the consistency of cream.

FINDING THE LENGTH OF AXLES.—Measure from the back end of the hub to the face of the spoke, then double the length and subtract it from the width of the track. If dodging spokes, measure half the dodge. This gives the length between the shoulders.

THE STEREOSCOPE NOT NEW.—The principle of the stereoscope was known to Euclid, described by Galen, 1500 years ago, and more fully in 1599 A. D., in the works of Baptist Porta.

GOLD INK, as it is called, is made of gold leaf crumbled into gum arabic water. When dry it will take a fine polish by gentle friction, a fact not generally known.

GOOD HEALTH.

Sunstroke or Thermic Fever.

No error can be fraught with more dangerous consequences than that of failing to discriminate between heat exhaustion and true sunstroke. The former is comparatively a mild affection, which does not differ in symptoms from any other form of acute exhaustion. It is characterized by dilated pupils, a cold, pale and perspiring skin, a quick but feeble pulse, with great general prostration, and a tendency to syncope. Recovery ensues within twenty-four hours under rest and the administration of stimulants.

True sunstroke, or *coup de soleil*, is a far more terrible affection. It is characterized by contracted pupils, a hot, dry and flushed skin, rapid and forcible pulse, throbbing carotids, labored or stertorous breathing, with profound coma, or delirium and convulsions ending in coma. In the fulminant cases that have been observed, the unfortunate persons have dropped dead as if struck a mortal blow by an unseen hand. Contrary to the popular opinion, it is not necessary that the patient should have been exposed to the direct rays of the sun. For, as was noticed by many distinguished observers, and practically demonstrated by Dr. H. C. Wood, Jr., in his experiments on animals, excessive heat, and heat alone, is the essential factor in this disease. Many of the worst cases have occurred at night, in houses, in tents, and in narrow defiles, where the sun never entered, but where the atmosphere was hot and stifling. It is, therefore, a true fever, and, as suggested by Dr. Wood, should be designated thermic fever, as expressive of its exciting cause.

The treatment, which must be instituted promptly, can be summed up in three words—reduce the temperature. It is the extraordinary high temperature which is burning up the patient, and which, unless speedily reduced, will cause death by paralysis of the heart. He should, therefore, be at once removed to a shady place in the fresh air, his head slightly elevated, and his whole body, especially his head and chest, kept deluged with ice water. An ice cap, in addition, should be applied to the back of the head, until his temperature and pulse have fallen. Aconite internally will also probably be found beneficial in controlling

the circulation. Morphia, hypodermatically, has been found to be of great value in cases characterized by restlessness and convulsions. If the attack has come on shortly after a meal, there can be no doubt of the propriety of at once unloading the stomach by an emetic. If the patient is insensible, apomorphia, gr. one-tenth, may be given hypodermatically. The Australian physicians produce emesis in these cases by the rectal injection of twenty grains of ipecac. They have always noticed an abatement of the symptoms as soon as vomiting began.—*Medical Bulletin.*

The Sexes.

The Hebrew women are the longest lived and the colored men the shortest. It appears from the gathered statistics of the world that women have a greater tenacity of life than men. Nature worships the female in all its varieties. Among insects the male perishes at a relatively earlier period. In plants the seminate blossoms die earliest, and are produced in the weaker limbs. Female quadrupeds have more endurance than males. In the human race, despite the intellectual and physical strength of the men, the woman endures longest, and will bear pain to which the strong man succumbs. Zymotic diseases are more fatal to males, and more male children die than female. Deverga asserts that the proportion dying suddenly is about 100 women to 700 men; 1680 men in the United States, in 1870, committed suicide to 285 women. Intemperance, apoplexy, gout, hydrocephalus, affections of the heart or liver, scrofula, paralysis, are far more fatal to males than females. Pulmonary consumption, on the other hand, is more deadly to the latter. Females in cities are more prone to consumption than in the country. All old countries not disturbed by emigration have a majority of females in the population. In royal families the statistics show more daughters than sons. The Hebrew woman is exceptionally long lived; the colored man exceptionally short lived. The married state is favorable to prolongation of life among women. Dr. Hough remarks that there are from two to six per cent more males born than females, yet there are more than six per cent of females in the living populations, from which statistics we conclude that all women who can possibly obtain one of those rapidly departing men ought to marry, and that, as men are likely to become very scarce, they cannot be sufficiently prized by the other sex.

THE ART OF RISING EARLY.—The proper time to rise, says the *Lancet*, is when sleep ends. Dozing should not be allowed. True sleep is the aggregate of sleeps, or is a state consisting in the sleeping or rest of all the several parts of the organism. Sometimes one and at other times another part of the body, as a whole, may be the least fatigued, and so the first to awake, or the most exhausted, and therefore the most difficult to arouse. The secret of good sleep is, the physiological conditions of rest being established, so to work and weary the several parts of the organism as to give them a proportionately equal need of rest at the same moment; and to wake early and feel ready to rise, a fair and equal start of the sleepers should be secured; and the wise self manager should not allow a drowsy feeling of the unconsciousness or weary senses, or an exhausted muscular system, to beguile him into the folly of going to sleep again when once he has been aroused. After a few days of self-discipline, the man who resolves not to doze, that is, not to allow some sleepy part of his body to keep him in bed after his brain has once awakened, will find himself, without knowing why, an early riser.—*Popular Science Monthly.*

OFFICE-SEEKING A DISEASE.—President Cleveland recently called office-seeking a disease, and he thus explained to a friend why he made use of that expression: I go to bed after a long day with a feeling that I must be the meanest man in the world, for I seem to say only no where I would be only glad to say yes. But this office-seeking is a disease—I'm entirely satisfied of that. It is even catching. Men get it and they lose the proper balance of their minds. I see them here as undoubtedly crazy as though they were in a lunatic asylum. I can't account for it, but it is clearly a disease. I've known men come here to Washington on other business, with no thought of office; but when they had been here a couple of weeks they caught it. They seem suddenly to get a mania, and such men have come in here for a place when I knew that before they left home they hadn't thought about office.

APPETITE.—The *Lancet* says that appetite is a most misleading sensation, only remotely related to the actual demands of the organism. If we only ate deliberately we should find half our accustomed quantity of food sufficient to satisfy the most eager cravings of hunger, and hence save ourselves from the evils of dyspepsia, or on the other hand, a tendency to over-increase in weight.

MACHINE SHOP DUST IN THE LUNGS.—At a late meeting of the microscopical society in London was shown a section of a Sheffield saw grinder's lung, the irritation from the steel dust inhaled having gradually obliterated the lung structure and rendered it perfectly useless for breathing. Sections of lungs showing carbon deposits from London smoke were also exhibited.

MINING SUMMARY.

The following is mostly condensed from journals published in the interior, in proximity to the mines mentioned.

CALIFORNIA.

Amador.

FROM SUTTER CREEK.—At the Lincoln operations are being prosecuted on a small scale, owing to the water supply being short. Only five stamps of the mill can be kept going, and but little prospect of an increased supply of water until the rainy season sets in. The Iowa mill will commence crushing in a few days. There is a large quantity of ore on the dump, which is estimated to be of the average high grade.

THE NEW YORK MINE.—Amador *Dispatch*, Aug. 29: Work at this mine has been progressing rather slowly for some time past owing to various circumstances, but Mr. W. G. Anderson, the superintendent, informs us that they will commence sinking again in a few days on a more lively scale. He also says that arrangements have been made for putting up a ten-stamp mill, and that work on the same will be commenced in about two or three weeks. A ledge of sufficient magnitude has already been developed to warrant the company in going to the expense of putting up the mill, and they have decided to do so without unnecessary delay. The mines situated along the gulch between Jackson and Middle Bar seem to be keeping up their lick in the way of producing good rock, and rich strikes now appear to be the rule and not the exception.

MATSON.—Amador *Ledger*, Aug. 29: This mine is located at Butte City and is owned by D. D. Matson, J. W. Brown and P. Fleming. On Thursday of last week a strike of unprecedentedly rich rock was made at a depth of only 25 feet from the surface. A specimen was left on exhibition at Ginochio's store, Jackson. It is the finest sample of gold ore we have ever seen. It is literally covered with free gold, and the disposition of these outcroppings leaves no room to doubt that the seams of gold run, in most instances, clear through the specimen. Altogether the piece of rock does not weigh over five or six pounds, but it is estimated to contain over \$100 in gold. The ore carries no sulphurets. The size of the vein from which this sample was taken we have not heard, but we are informed that a considerable sum has already been extracted.

EL DORADO.—Work on this claim, which joins the Median, near Amador City, on the north, is being prosecuted as energetically as the capital of the owners will permit. At the depth of 290 feet one drift has been run 80 feet, another 35 and 10 feet of crosscutting. A ledge four feet wide has been found on the hanging wall with excellent gouge matter. Free gold is frequently met with in the ore and its general character is good. They are now crosscutting toward the foot-wall, where they expect to meet with important developments.

MISCELLANEOUS.—Work on the Spanish mine near Enterprise was abandoned on the 12th of August. W. H. Martin & Co., of San Francisco, have expended over \$40,000 during the past 18 months in prospecting the ground, without meeting with any encouraging indications. There is no prospect of work being resumed under the present ownership. Operations were temporarily suspended on the Median, near Amador City, two weeks ago, pending final arrangements regarding the purchase of the property by the bondholders. When these matters are fixed, as they no doubt will be in a short time, the mine will be started again and the erection of a mill commenced at once. At the Loyal Lead mine, near the Gover, in crosscutting east, a fine body of quartz has been discovered. They have penetrated the ledge four feet, but its exact width is as yet unknown. The ledge throughout shows free gold to the naked eye. At the South Spring Hill the work of building to additional stamps to the mill will be commenced next Monday. A large proportion of the lumber is on the ground. R. B. Reed has moved the five-stamp mill from his claim near Pine Grove, on to the St. Louis mine near by, and expects to start crushing in a short time. The Lambing gravel mine near Lone is again in full blast. Sixty men are employed and work is prosecuted day and night.

Calaveras.

WEST POINT.—Calaveras *Chronicle*: The Cook Bros. are shipping this week to Selby & Co. a lot of 10 tons of the richest tellurium sulphuret ore that ever went out of Calaveras county. Dr. Wright, it is reported, has struck a fine prospect about two miles east of the Cook Bros.' Bonanza. The Virginia mine, a northern extension of the Gilman Bonanza, is opening up splendidly, we hear. Clark & Co. are putting up first class hoisting works on their Anderson Flat mine, which is in the Fred Greve district. Experts are sampling the Reed & Hillary, Lone Star, Texas and Riverside mines, near West Point, with the intention to purchase if satisfactory and they can make terms with the owners. The Russell Reduction Company at West Point have contracted for the cutting of 3000 cords of wood to carry them through the approaching winter. This looks like business.

El Dorado.

SLATE MOUNTAIN.—Georgetown *Gazette*, Aug. 28: Twenty men are now at work on the Slate Mountain mine. The ore continues rich, and the five stamps kept continually engaged pounding out handsome dividends for the lucky owners. The Josephine mine and ten-stamp mill is booming right along with a large force of men. The Idaho mine has finally been placed in good working order, and 13 men are now at work. Sinking on the ledge is going on, and some very rich ore is being brought to the surface. It is plain to judge that the next clean up of the five-stamp mill will be a good one. The new management of this mine is evidently going at it right.

Inyo.

REPORTED STRIKE.—Inyo *Register*, Aug. 27: Mr. Frank White, just arrived from Madera, brings with him a specimen of silver ore from a late discovery, near Mt. Gibbs, at the head of Bloody canyon. The ore looks as rich as any we have seen for many a day, and, we are assured, assays something over \$500 per ton. The ledge is over 19 feet in width, and in five different places has been opened to a

depth of 20 feet in each. One of these in particular is said to show a body of splendid ore. The owners, whose names we did not learn, are wonderfully pleased with their prospect. There are three 1,500-foot locations of the ledge.

SHIPMENTS.—The last of 80 tons of Cerro Gordo ore, belonging to Tom Boland, also five tons of bullion from Fitzgerald's Modock furnaces, were shipped to the Selby works this week. Teams are landing ore almost daily at Keeler from Cerro Gordo and Lee district.

HAS IT IN SIGHT.—*Independent*, Aug. 29: One of the old timers at Kearsage mine has a good thing in sight; the lucky man is Mr. Robert Burnham. Last Monday a carload of ore was shipped from near Soda Springs to be worked at Belleville. The mine is called the Lucky Baldwin, and is a few miles east of the C. & C. railroad a short distance north of the station named. The ledge is two feet wide and at least one-half of the ore goes \$200 a ton; the rest of the ore goes over a hundred dollars. The mine is well opened up, and there is plenty of ore in sight to warrant the building of a 10-stamp mill. This the owners propose to do soon.

SAN CARLOS.—Many years ago a mining location was made in the Inyo range opposite Camp Independence and named San Carlos. A little prospecting was done and several small veins found, but no large ore body; then the claim was abandoned. Lately S. A. Densmore relocated the claim and worked it. A number of the small veins were traced till they ran together and now make a well defined ledge two and one-half feet wide. The ore contains 56 ounces of silver per ton and 39½ per cent lead. The mine is near the C. & C. railroad; a tramway from the mine to the road would cost but little. A shipment of two carloads of the ore will be made in a few days to test its quality.

Plumas.

CHEROKEE MINE.—Greenview *Bulletin*: We are informed by a mining man that there is a good prospect for the Cherokee mine being started up soon. The property has been idle during the past two years, much to the detriment of the owners and the community. It was operated for years, and we learn that over half a million dollars was taken out. It is considered a good property, and it is too bad that a mine capable of yielding the returns which have been obtained from it should be permitted to remain idle. Mining men inform us that there is a large vein of good ore, such as is capable of returning a handsome profit. It is to be hoped that the owners will not permit it to longer remain idle. It is situated in a good mining locality. Near it is the Green Mountain mine from which good pay ore is now being milled at the rate of 95 tons per day. At the Indian Valley, another mine near by, the shaft being sunk is in very rich quartz.

TAYLOR-PLUMAS.—Yesterday we were shown a letter from the secretary of the Taylor-Plumas Mining Co., which stated that arrangements were being perfected by which operations in that mine would be resumed.

Placer.

FOREST HILL DIVIDE.—Correspondent *Placer Herald*, Aug. 29: Having had another interview with our friend and mining expert, Mr. J. H. Ritchie, in relation to various mines, I think it would be interesting to your readers to give a synopsis of his visits and opinions, as he is an experienced miner, and has been superintendent of various prominent mines west of the Rockies. He has been on a tour of inspection over the Divide mines and speaks of that region very highly, says it is the best mining district ever discovered, and being, as it were, nearly obliterated from the mining record, and miraculously turning up in its immense magnitude in richness and space, that the mind can scarcely conceive its importance. One party says he saw panned out in one pan in the Mayflower 32 ounces of gold; but this is not all—as the Queen of Sheba said of the greatness of Solomon, "half of it was not told." He first visited the Spring Garden mine, and speaks highly of it. He did visit all, but next came to the Mayflower, superintended by Mr. Chapellet, who kindly gave him information as to the richness and facilities for working. The facilities are not in ratio with its immense richness, but they have it surveyed to run a tunnel into the works so as to run the gravel out on cars, instead of as they are now doing, hoisting to the surface and pumping water. Thus the tunnel will insure an increase of the product of gold 50 per cent. The working force is 120 men. The Washington mine is situated about a mile from Forest Hill. They are sinking a shaft and working in a scientific manner with splendid machinery—the superintendent showing experience and workmanship. The Baker mine is superintended by Mr. Dodge. Their tunnel is in 300 feet and they calculate to put on more machinery soon. Did not visit the Breece & Wheeler mine, but was told it prospects from \$1.00 to \$2.50 to the pan. It is situated at Bath. All seem to work with confidence of success. The Hidden Treasure mine, at Sunny South, was next visited. The superintendent, Mr. Win. Cameron, is running it with 80 men. This is one of the most practically worked mines, with the finest kind of apparatus, showing great facilities and good management. It is a first class mine. And the great bonanza, known as the Derby mine, is certain to be one of the most valuable on the Ridge. J. M. Bardwell and others are the lucky owners. They have it entered in the Land office for patent. It contains 140 acres in Sections 26 and 35 in Township 15. The rock was very hard to tunnel and has cost the company about \$30,000, the tunnel is in now 1800 feet, and is in to the pay gravel, which looks very favorable for being one of the greatest mines out. They are making calculations to commence on a large scale, so you may hear of them building a vault to keep the dust safe. Mr. Bardwell was speaking of the form of these channels with bars, coves, etc., in those ancient river beds being similar to the present rivers on surface to all appearance. A few miles further up is what is known as the Dam claim. It is worked on an economical scale by the owners, who are nine in the company. They are in about 500 feet, drifting out in a large breast and piling back the cement and rubbish, filling up behind as they go ahead. And the beauty of it they need no timbering, which, you are aware, is a great saving in expense—it is equal to free water in hydraulicking. I have not seen half the tunnels that they are to work on, but I will say that the "Divide" is certain to be the richest, and with such an immense area, the largest mining district ever discovered in California.

MAYFLOWER.—Placer *Argus*, Aug. 27: Forest Hill is livelier than it was at the time of our last visit six or seven months ago. This improvement is due, doubtless, to the "strike" in the Mayflower, made last May, and heretofore noted in these columns. Business is rather better than in most other towns in this county or in the State. The merchants are doing a better business than is usual at this time of year, and altogether a better feeling prevails. Of course, we visited the one great center of attraction at "the Hill," and that is the Mayflower mine. We were surprised to find so much of a settlement there—quite a town in fact, and a busy town too. In addition to the many substantial structures already existing there, we noticed a fine large two-story building going up. It is to be used as a lodging house for the workmen. Work in the mine is being pushed forward energetically by Mr. Chapellet, the superintendent, nearly 100 men being employed there at present. The superintendent and his foreman, Jake Kelton, were so kind as to pilot us through the labyrinthine works of the mine under ground. We saw enough to require columns to describe it, if we were writing for people who did not know better than we do what mines and mining are. Suffice it to say, the works are among the finest and most extensive of any on the coast. The top of the hoisting works is 106 feet above the surface. The mill has had its capacity increased from ten to twenty stamps, and the appliances for ventilating the mine, for conveying the steam from the main engine above to a donkey engine below, for draining the tunnels, etc., are all of the most practical and satisfactory kind. We were shown some of the richest kind of gravel on the bedrock of the channel of the ancient river, 350 feet beneath the surface. But we have not the space nor the time for an exhaustive and accurate description, even were it in our power to give it. We have it from the best authority that the mine is "paying big," though we did not take time to obtain figures. With all that has been done there during the past seven or eight years, never yet has a man lost his life. Thanks are due to Mr. Chapellet for the thorough system and code of signals, regulations, etc., which obtain.

Shasta.

LEASED.—Shasta *Co. Democrat*, Aug. 26: S. H. White, of Lower Springs, has leased his mines to Merithew & Pushaw. Those gentlemen purpose to have a Huntington mill turning out the yellow metal within thirty days. Since Whitton & Small started up their horse arastra on the Squaw creek claim about a week ago they have been grinding out between \$50 and \$60 a day. They crush about 1500 pounds in 12 hours. N. J. Pehrson, O. Anderson and a Mr. Berg are sinking on a splendid prospect lately discovered on Rock creek, about one mile east of Shasta. It is a three-foot vein; much of the rock shows free gold and prospects way up. Mr. Clark informs us that Monday he struck the richest kind of ore in the Harrison mine, now his property. Decomposed rock is perfectly yellow with gold, and the sulphurets are worth several dollars to the pound. Such a prospect is rarely seen in the State. Jake Hudson and a German immigrant have struck an encouraging gold and silver prospect across the river near the Sinaloa mine and about 600 yards south of the Buckeye and Waugh ferry road. The German thought first he would cultivate the land, but sad experience has made him a miner. Lem Williams says the new smelting furnaces at Copper City will be running by the 10th of next month. It is reported that a large San Francisco company is negotiating for the Northern Light and Extra mines, which, if consummated, will make that burg boom as it did in its palmy days.

THE MAMMOTH MINE.—Redding *Independent*, Aug. 28: Located in close proximity to Redding is one of the finest mineral deposits that we have ever had the pleasure of feasting our eyes on. It is situated just about a quarter of a mile west of town, near the old Shasta road, and on what is known as the Breslauer grant. The parties owning and at present pushing developments on this rich claim are Messrs. B. F. Slater and George Bassett, two energetic and well-known citizens of this place. Through the courtesy of the former gentleman, a representative of the *Independent* had the pleasure of visiting the mine last Tuesday afternoon. We were surprised beyond a doubt at the size of the ledge and also at the richness of the ore. The ledge is encased between two solid walls, and is twenty-five feet in width, which runs north and south. They have dug a trench across the ledge east and west to the depth of thirty feet, which exposes the ledge matter so that even a farmer's heart would gladden if he got sight of it. The ore assays from \$20 to \$500 a ton. They have in the neighborhood of a hundred tons on the dumps, and most of it is similar to the Shearer & Rattler ore. At present they employ seven men and are working steadily day and night, and as soon as machinery can be obtained and placed in position to treat the ore there will be over a hundred men employed.

A GOOD DISTRICT.—Republican *Free Press*, Aug. 23: The Old Diggings mining district is gradually making for itself a name as a reliable and permanent one. There are many well developed mines there of gold quartz and rich sulphurets. The quartz is similar to that taken out on the French Gulch and Deadwood districts, and as easily worked, and so far as known, of equal depth. There are several locations which we could mention that have paid well by arastra and small mills. One ten-stamp mill—Reid & Co.—is in operation, and Reuben Clark, of Colusa will soon have another in operation. O'Neil, Flemming, Ebersole, Luce and others we might name, are and have been for some time past making a good living. A little capital is all that is necessary to give the Old Diggings a boom.

Sierra.

PHOENIX QUARTZ MINE.—Tribune, Aug. 29: The Burleigh drill together with the pipes, engine and boiler, formerly used at the Savage placer mine, have been purchased by the parties who are to operate the Phoenix mine and they will be placed in position there at once in order to commence work on the tunnel. The proposed tunnel will be run so as to tap the vein 500 feet below the bottom of the shaft, which shaft is down 300 feet. The length of the tunnel will be 500 feet and it is calculated that five months will be required to run it. It is mainly through the efforts of Mr. A. C. Busch that parties have been prevailed upon to take hold of this property. If the ledge proves to be as good when struck in the tunnel as it is in the bottom of the 300-foot shaft, which there is no doubt it will from all

indications, the Phoenix will then be one of the biggest mines in the State. The outlook for Sierra City is getting brighter every day.

A NEW ENTERPRISE.—Antoine Demartine gave a *Tribune* reporter the following particulars concerning the Cleveland mine, of which claim he is one-half owner: Eight stamps of the Hitchcock mill, at the Sierra Buttes mine, have been purchased and will be erected at the Cleveland mine and run by water power. Ten or twelve men will be put at work at once to build a road to the mine, the distance of which is about one mile. It is expected to have the mill built and running in a month and a half. A force of men was put to work Tuesday on a tunnel which will give 250 feet depth on the ledge.

MILL STARTED UP.—The 10-stamp mill at the Young American mine was started up last Saturday and our informant states that it runs like clockwork. We expect to be able soon to chronicle some handsome bullion yields from this mine.

THE MARGUERITE MINE.—Supt. Myers, of the Marguerite mine, came up from below a few days ago. He can not state anything definite as to when operations will be resumed at the mine. We are sorry to say that the company is in litigation at the present. It is unfortunate that the mine should be closed down, even temporarily, just at a time when it was gotten in shape for working successfully and with such splendid promises of paying well.

STRINGERS.—Two men comparative strangers in that place, are reported to have struck a fine looking quartz ledge not far from Sierra City. Theodore Smith has taken out about \$2,000 to date, from the "pocket" he struck in the Osceola ledge, at Alleghany. Good gravel has been encountered in Lowell's claim at Alleghany.

POKER FLAT.—Correspondent *Mt. Messenger*, Aug. 29: Belmont Consolidated Company mill is not running on account of scarcity of water. The upper tunnel is in about 70 feet, and connects with the middle tunnel by a shaft about 80 feet in length. The quartz thus far has averaged about \$30 per ton. The Forbes quartz pulverizer will be started again as soon as water comes. The average width of the ledge, between the two walls, is about thirty feet, including three stringers of quartz, 3000 long with 600 feet, usual width of location. Sierra Phoenix Co. have a ten-stamp Huntington quartz mill, running night and day, with eight men at work. Silver plates are used. The ledge has been traced for 6000 feet in length, and is exceedingly wide. The lower main tunnel is in 100 feet and delivers ore to the mill chute from above, 75 feet, connecting there on a line with the ledge. Prospecting tunnels have been put in at various places for 3000 feet, with satisfactory results. There is available 150 feet pressure of water—all that of Canyon creek—to run the mill and drain the mine so that the ledge can be worked to a great depth. A new ledge is being prospected that shows up much gold at Deadwood.

David Ross is building a house there. Ross, O'Donnell and Mr. Wood are running a bedrock tunnel in their drift mine, and expect to reach pay gravel this fall. Work has been temporarily stopped on the Grand Prize on account of need supplies. Rock in main tunnel still has to be blasted but is growing softer. A McIntyre and M. McFarland, owners in the Ballarat, will soon resume extending their main tunnel, and pay gravel is expected three hundred feet ahead. Bonanza Extension Co., will extend their main tunnel, in fifty feet, toward the pay channel in the Grand Prize this winter. Three hundred feet is expected to tap gravel and 700 feet good pay. Sunnyside Co. have their tunnel in near 500 feet, with face in prettiest kind of soft grey and light blue slate rock, similar to that in the North America. An upraise is being made for the channel. Bunker Hill Co., whose ground is mostly in Sierra, near Pilot Peak, obtained a prospect of 20 cents to the pan the other day. Soft slate rock in main tunnel.

PORT WINE.—Mountain *Messenger*, 29: Quite a number of men are working at the Queen drift mine. Good pay will soon be reached. The other mines hereabout have done very well this season. The public school has been closed for two weeks. Ninety-six and a half ounces of gold was cleaned up for last week's run at the Sutherland quartz ledge, owned by the Sierra Phoenix M. Co., Poker Flat.

Tuolumne.

TIOGA MINES.—Correspondent *Tuolumne Independent*, Aug. 29: Tuolumne county bids fair, by the present outlook, to be once more the scene of another mining excitement. This time it is silver; and there is no end to it—native and horn silver—in an unbounded quantity. The first grand strike was that of K. A. Sawyer, on the "Consolidated" and "Deer Lodge." He has got a twelve foot ledge all full of "black metal," and streaks through it of the "simon pure." There are four shafts on the two claims, all full of "black metal." The shafts are from 15 to 20 feet in depth. A gentleman who was here this week, says that it will assay at least five or six thousand dollars to the ton; and, in the language of Col. Sellers, "there's millions in it." These claims are situated on Mt. Gibbs, near the center, on the western slope, and are in the Tioga district, Tuolumne county, and about four miles from Bennettville, almost due south. Everybody is excited, and claims are being located all around. There is quite a number of prospectors here, doing assessment work, and all feel elated. This "rich strike" will benefit Sonora to some extent, as it will be the starting point for the new El Dorado, and before two months the camp will be booming. It will be a second Virginia City, only on a larger scale, as the ledges can be traced from Mt. Conness, about seven miles north of here, to about four miles south—the whole distance being about eleven or twelve miles. I have seen the ore from Sawyer's claims, and although not an expert in silver ore, can truly say that he has got a "big bonanza."

NUGGET.—We saw a fine nugget of gold, weighing about \$18, which John Coffee found in his claim, near Kennebec Hill. Gus Wickelind, got a piece at Pine Log last week. This was worth, in gold, about \$30. Both of the pieces contained quartz.

Trinity.

NEW RIVER.—Cor. Yreka *Union*, Aug. 29: We have passed the season of quietness consequent upon the rush to New River last winter and spring, and for the last three weeks a constant dropping in and commencement of work by men of some means insures us a steady development of the mines of this district from this time out. In the past the prosperity of this camp has been gauged by the number of

stores, hotels and saloons that have been supported. From this on it will depend upon the output of gold from the mines now prepared and in a fair way of being ready when the water season commences. The San Francisco Company (three men employed) are running 30 tons of good rock through an arrastra as a prospect, to warrant or discourage the erection of a mill to work the good-looking ore from their ledge located near the Mountain Boomer mine. The Mountain Boomer mine is being opened and ore taken out to run in their first-class arrastra, which ground out \$11,000 last fall. Four men are employed in this mine. The Tough Nut mine, two to four men employed, are getting out ore to keep their two arrastras running. The Hard Luck mine employs six to eight men, taking ore from an incline 180 feet deep, where the ledge is three feet wide. This mine has a first-class water-wheel and arrastra and has ground out over \$30,000 since February 1st. Next to the Hard Luck mine is the Ridgeway, employing from two to five men. Their new water-wheel and arrastra is ready to run upon a dump of at least 50 tons of ore, and over 200 tons are in the stopes ready to be taken out when wanted. Mr. Healy, of the St. Elmo mine, has two to four men employed in running a tunnel and constructing a first-class water-wheel with which to run two arrastras. The Sherwood mine, employing four men, has been leased by parties paying a royalty of \$2 per ton of ore ground. This ore is to be crushed in the five-stamp belonging to the Uncle Sam mine. The Grover Cleveland mine, employs five men, has one arrastra ready to run upon a light increase of water. Two hundred tons of good ore are in sight, three and a half tons of which yielded \$225 of gold. The above may be classed as mines of permanence and value, having a good amount of rock that will work from \$30 per ton and upward, and as soon as water comes each mine will have its own means of reducing the rock. There are at least five more ledges being prospected and developed with a showing equal to most of these named.

DEADWOOD.—Cor. *Trinity Journal*, Aug. 29: All of the mines in operation are doing well. Wm. Blagrove has out about 20 tons of ore which will go at the best—\$100 per ton. Lamb & Co. have a very good prospect shaft down to the depth of 45 feet shows up a vein of nice paying ore. Jud. and Walter Van Matre have closed down on their mine for a time in consequence of starting up their reduction works which will only continue for a few weeks and then work will again be resumed. The Vermont mine purchased a short time ago by Minear & Co. are doing lively work. We live in hope to see a bonanza opened in that section of Deadwood. McDaniel on the Enterprise location has a very nice pile of ore upon the dump, and a very nice healthy vein of rock at the end of a 100-foot tunnel. Mr. P. Varnum has struck the west extension of the Black Bear, and judging from the appearance of his dump pile and the size of the vein we have every reason to believe his find to be a bonanza. Samuel Hulbert of Eastman gulch passed through Deadwood the other day. Sam reports his vein on Shooter gulch as looking better than ever and if such be the case it is not necessary to go beyond the boundary line of Trinity to see the richest specimens in the State. C. Blakemore has out about 124 tons of splendid ore and plenty more in sight.

NEVADA.

Washoe District.

CON, CALIFORNIA AND VIRGINIA.—*Enterprise*, Aug. 29: On the 1750 level about 125 tons of ore are being extracted, on company account, of the average assay value of \$22 per ton. From the Jones lease section above the 1550 level, about 60 tons per day are being extracted, and assaying about \$15 per ton. The northwest drift on the 1050 level was extended 37 feet during the week, and is now running in good working ground, having passed through the broken material of the old workings. During the past week the air has been bad in some of the ore breasts of the 1200 level, proceeding from foul gas coming, it is thought from some of the old burned out workings below. Better ventilation, however, has obviated this difficulty during the last day or two. Rumors have been prevalent the last few days that a largely increased force of men was to be put to work in the Jones lease section of the mine, but this will not be the case for a few weeks, or until better milling facilities are given than exist at present. The Jones lease terminates a year from next November.

HALE AND NORCROSS.—Work is concentrated upon the opening of the station in the deep winze for the 3100 level. It is being made 15x10 in the clear, and the first set of timbers is in place, and the second set soon will be. Some good ore is met with in chambering out the station, giving assurance that when the drift is fairly started on its southeast course to connect with the drift now advancing to meet it from the Combination shaft, it will pass through the good ore vein thought to lie in that direction, east of the winze. The ore in the bottom of the winze itself, however, indicates the possibility that the main ore body may really lie to the west of the winze. This will be easily demonstrated, however, when the 3100 level is fully opened and connected with the shaft by running a crosscut west which can then be done without fear of tapping more water than can be handled. During the coming week good progress will be made with the northeast drift toward the shaft.

CROWN POINT.—The thorough overhauling of the machinery continues, and will be completed before the first of September, when it is rumored that work will be resumed in the mine and also in the Belcher to some extent, in case the milling facilities on the Carson river will allow. The Mexican and Santiago mills are being put into a first class state of repair for active work as soon as an increase of water in the river will permit. The Eureka mill, also under the Jones management, is to be thoroughly overhauled and put in repair by sections, as there is water enough to keep one-third of its stamps running on ore from the Consolidated California and Virginia mine.

UNION CONSOLIDATED.—The main north lateral drift is being steadily pushed ahead at the rate of 55 feet per week, and has reached within 100 feet of the Sierra Nevada south line, running in vein porphyry and quartz. The formation and ore indications are favorable for this drift running into an ore body before long. The quartz met with is of a very favorable character, and increases in quantity and quality with

further advancement. It was rumored yesterday on the street that a valuable strike of rich ore had been made at that point, but "there's nothing in it."

YELLOW JACKET.—The daily yield is now a little over 200 tons from the 1200 level and the levels above up to the 400. Good ventilation and air circulation is given through the old shaft and incline and the imperial incline. The Brunswick mill is working finely and doing better work even than was expected when it started up with the auxiliary steam power arrangement.

ALTA.—The station chamber for the west drift on the 700 level is now completed, and advancement toward the ore body developed by the upraise from the 900 level is inaugurated. The distance is about 500 feet. The ground is favorable for a good rate of advancement.

BEST AND BELCHER.—On the 1000 level west crosscut No. 2, recently started, 200 feet from the Consolidated Virginia south line, is now in 96 feet, 44 feet having been made during the past week. The face of the drift is in vein porphyry, with streaks and bunches of quartz.

OPHIR.—The upraise from the 500 level being completed to its connection with the old Mexican shaft, that shaft is now being cleaned out and put in a thorough state of repair, from top to bottom, for ventilation and prospecting purposes.

ANDER.—The work in this mine is confined to drifting west on the 175 and 375 levels. On the 175 the drift is in 40 feet, principally in vein porphyry, and that on the 375 is in 500 feet, and running in quartz of a very favorable nature.

SIERRA NEVADA.—The west crosscut on the 520 level has been advanced 60 feet during the past week, making a total length of 580 feet. It continues in dry, hard porphyry, with no favorable changes to report.

JUSTICE.—About twenty tons per day are being extracted from the southern portion of this mine, on the 450 level, through the Woodville shaft, and reduced at the old Thompson mill above in the canyon.

GOULD AND CURRY.—Crosscut No. 1 west on the 1000 level has been advanced 48 feet during the week, giving it a total length of 249 feet. Face in vein porphyry, clay and quartz seams.

MEXICAN.—The middle crosscut, recently started east on the 500 level, is now in about 60 feet in wet, heavy ground, with clay and quartz in the face of the drift.

KENTUCK.—The regular extraction of low grade ore from the upper levels continues, which is hauled by teams to the Rock Point mill on Carson river for reduction.

Aurora District.

THE SITUATION.—Carson *Free Lance*, Aug. 24: In contrast with the palmy days of Aurora, when she contained eight or ten thousand inhabitants, at the present time all told, the town does not contain more than seventy-five persons. The courthouse is locked and barred, and is fast becoming ancient ruins. Large brick buildings two stories high are fastened as tight as if hermetically sealed, by heavy iron doors closed by day and night waiting for Aurora, the goddess of morning with her rosy fingers, to shed redolent light into those mining regions. Just now the eastern horizon seems to be growing brighter, and the watch-word already is being passed from lip to lip that the morning dawneth. The \$10,000,000 which has been taken from the mines is not forgotten. The report has gone across the water and reached London. An English company there is now considering the proposition made by Messrs. H. M. Yerrington, H. G. Blasdel and George Coulter, and it is expected will give their final answer by the fifteenth of September next. Just at what price it is not known, but the owners have all combined and have offered to sell to this company the Del Monte, a combination of ten claims, the Junieta, Humboldt, New Esmeralda and other mines. The latest news is to the effect that the company will accept the proposition, and that a large number of men will soon be put to work. Of the so-called outside claims, the Antelope, owned by Judge Sewell, of Nevada, and Judge McKinstry, of California is said to be looking well. Messrs. Simult and Donahue are now taking out some very rich ore from the Bright Star. The Grand Truck mine owned by Justice Field, Colonel A. C. Ellis, Mr. Neidy and others, has just been leased to Carson parties, and a force of men will at once be put to work. A rich streak of gold ore two feet wide in the ledge was struck which contains free gold and which assays about \$100 per ton. The last ore from this mine milled \$43, and there is now about 40 tons of ore of the same quality on the dump. This mine has cost the company in making development, a great many thousands of dollars, and is still a great pet with Justice Field and Colonel Ellis.

Como District.

ORE FROM COMO.—Virginia *Enterprise*, Aug. 28: The hauling of forty tons of ore from the North Rapidan mine, near Como, to Dayton for reduction was commenced yesterday. It is said to be fine looking ore, giving excellent assays, and is expected to pay well. If it does, good works will be put upon the mine immediately, with a view to practical development of the mine and the regular extraction and milling of the ore. The mine is owned by Dr. Hazlett and Senator Westerfield, of Dayton, and other men of means and energy.

Reese River District.

THE MANHATTAN MINES.—*Enterprise*, Aug. 29: The following report of Superintendent Curtis, of the Manhattan mines, Austin, gives an idea of the style of mining, number of men employed, etc.: At the Paxton incline the 870 drift has been cleaned out and a chute is being raised to connect with the Isabella cross-cut, and when completed the waste and ore will be removed through the Paxton incline. On the 1440 and 1500 levels tributaries are extracting considerable ore. No work is being done at present below the 1850 level. At the Lander shaft the 700 west drift is being continued, the formation being split up into several stringers. A cross-cut is being run into the west wall to prospect the ground south of the ledge on the 740 level. The cross-cut run into the hanging wall cut a good six-inch ledge of average ore, and drifts since run show considerable ore. A winze will be started to prospect the ground. Most of the tributaries on the 700, 740 and 800 levels are doing well. At the Union shaft the ledge cut in the south cross-cut has been drifted on about 60 feet each way; the ledge in the east drift has carried good

ore most of the distance; on the west side the ledge carries ore in bunches. During the past week the following men have been employed: Surface men on days pay, 38; miners on days' pay, 16; miners on contract, 38; miners on lease, 59; miners on tribute, 121; total 241.

THE MANHATTAN DIVIDEND.—Relative to the dividend of 25 cents per share declared by the Manhattan Mining Company, Reese River district, the San Francisco *Bulletin* says: It is the first declared by that company since February, 1877. The mine paid eight dividends up to that time, aggregating \$400,000. There have been three assessments, the last in August, 1879, the total being \$150,000. The mine is in Lander county, Nev., and has been a regular and large producer of silver bullion, but owing to expensive working and heavy discount on silver, there has been nothing to divide up among stockholders in the last eight years. It is so long since there was a dividend from this mine, that the one just declared will be a real surprise to many. The dividend will inspire hopes from some other claims that have appeared to be unprofitable in the past decade.

Taylor District.

QUIET.—Cor. *Eureka Sentinel*, Aug. 29: Our town is rather quiet at present. Yet there are over 100 men at work in the two principal mines here. The future of Taylor never looked as well as at present. Large chambers of ore are to be seen in both the Argus and Monitor ground, from which good sized quantities are being daily extracted and shipped to the mills in the valley. Rumor has it that the Monitor is about to change hands.

ARIZONA.

HUMBURG.—Prescott *Courier*, Aug. 29: T. W. Cochran, the superintendent of the West Humburg quartz mill belonging to the St. Louis Yavapai Mining Co., is now in Phoenix, his mill being shut down at present for want of water. We learn from the *Herald* that the company have let a contract for sinking 100 feet on the Gold Hill. Mr. Cochran has recently devised a plan by which base ore may profitably be handled for \$15 per ton, and on the strength of this the company is now purchasing such ores at 80 per cent of the total value per ton.

QUJOTOA.—A special to the *Times* of the 24th of Aug., states that the first car of ore from Mount Ben Nevis came down to the mill yesterday morning at 9 o'clock over the company's tramway. Everything is working nicely. Nick Warlamont is in charge of the brakes at the top of the hill. Mr. W. S. Lyle, president, has been here for several days. Mr. Arentz and Mr. Boss, will be here by Wednesday to witness the maiden milling of the Peerless Mining Co. Superintendent Smith is rushing everything through at a lively rate. Heavy rains and cool weather for the past two days.

PINAL.—Two miles of ledge from 80 to 100 feet wide and carrying ore of exceptionally high average is being developed by Judge Reymert. The Tucson *Star* devotes two columns to the description of this property, describing it as a second Comstock. The ledge is a contact vein between slate and syenite and pays from \$8 to \$400 per ton, two of the claims very much exceeding this. The owner has expended over \$50,000 in developments and has refused an offer of \$150,000 from the Bonanza company. The Specie Paying company's mill is now running on the ores from these mines and works it up to 90 per cent of assay. The *Star* pays a high compliment to Judge Reymert for his energy in paying all the heavy expense of developing this handsome property out of his professional earnings as a lawyer. The Tombstone M. & C. Co., paid \$23,500 for the Way Up and Gilded Age mines. Another smelter will be put up on the San Pedro by Judge Reymert.

SALERO.—The Salero camp near Tucson has only recently come into importance as a bullion producer. The *Citizen* states that the Waddell mill and mine are employing 37 men and 50 chloriders get their ore worked there. Large quantities of horn silver are found. One thousand gallons of water a day are supplied from a twenty-five foot well.

COLORADO.

WORK.—Georgetown *Courier*, Aug. 29: But little work is being done on the Dunderberg mine at present, although the results of the operations are good. The mine is in great need of machinery. The Ute creek mines are shipping between 35 and 40 tons of ore per month. Work has been resumed on the Great West mine, near Dumont. The lessees on the Mint vein are reported to be taking out good ore, and making good pay. Several tons of ore are at the mine awaiting shipment. Davis & Co. are making regular and large shipments from their Ute creek property. The average value of the mineral is over \$400 per ton. The last shipment of ore from the Mary Foster returned for first class, nearly \$1000 per ton. Colonel Baldwin informs us that there is an immense amount of development and improvement work being done in the Terrible mine and that the work of extracting the ore has not been fairly commenced. Several lessees, however, have large streaks of mineral exposed, and are making big pay. There is undoubtedly a large amount of ore coming out of the mines, every available burro and every ore wagon in this section are busy conveying mineral to the several ore markets in Georgetown. Shipments of ore are being steadily made from the Cashier mine at Empire. The mineral is improving as development progresses. Several feet of smelting and concentrating ore are exposed. There is a wide field for the prospector in Argentine, Cascade, and several other districts in the county. The mining properties thus far discovered and now in operation in these districts are producing well. The country, however, has not been thoroughly explored. The Empire City ledge is said to show a ten-inch vein of nearly solid copper pyrites, and some of the ore shows free gold. It is being worked by Wm. Moore. A party of men are working a prospect on Lincoln mountain, which is said to carry horn silver and silver glance. Over 9000 pounds of ore from the Queen of the West mine was marketed this week. Roberts & Co., lessees on the Centennial mine, opened up another fine vein of solid yellow copper ore in the breast of the second level from the 100-foot shaft last Friday. The streak varies from 2 to 18 inches, and gives promise of opening out to the width of several feet, as was the case in the first level. Two men are engaged driving the second level ahead. Henry Bates is

stopping above the first level on about a foot of mineral, accompanied by several feet of concentrating ore. The Centennial is constantly improving. Its production is steady and the value of the ore is increasing. Work is going steadily forward in the Moline tunnel, and large quantities of galena is being extracted. The upward tendency of the lead market is causing renewed activity on the lead producing veins. Fourteen tons of ore from the Two Sisters lode, near the Joe Reynolds, were shipped to Georgetown this week. The returns showed from 80 to 250 o.s. silver per ton. We understand that the owners of the Mary Foster have notified their lessees to cease work. The lessees have been making big money. The owners probably intend to take the ore out themselves and reap all the riches. A couple of lessees on the Invincible lode, at Ute creek, shipped over two tons of ore last week that milled upward of \$200. This was the result of only twelve days' work. A great many building improvements, such as cabins, ore and shaft houses are being made at the mines in Cascade district.

NEW MEXICO.

GENERAL NOTES.—Silver City *Enterprise*, Aug. 29: Thomas and Noel, who are leasing on Gilmo's claim, on the hill just west of town, are taking out some very fine chloride ore. The new roaster and rolls recently added to the Flagler works are now working successfully. Sixty tons of concentrates are treated daily. The Peacock mill in the Mogollons will start up to-day, and in a very short time some forty or fifty teams will be engaged in hauling the concentrates from the mill to this place. It is probable that the concentrates will be treated at the Flagler works in this city. The Copper King, in Apache district, is making a remarkably good showing. A shipment of thirteen tons of ore from this property recently made averaged 107 ounces, and it is claimed that all of the ore taken out will average 100 ounces. An average in the bottom of the main shaft returned 250 ounces. The Solid Silver mining company recently purchased a pump from the Santa Rita company, which will be used in the lower workings of the mine. A larger pump will be purchased in the East for the surface. The Black Hawk mine is looking exceedingly well. Word reached this city on Tuesday, that the Cooney mine in the Mogollons, had been closed down. There is an abundance of ore in sight and as the mine for two years past has been paying handsome dividends to its owners, the cessation of work is but temporary. It is learned from a gentleman recently from Carlisle that the company's mill and mine at that place will resume operations some time next month. If the new process now being experimented with should prove a failure twenty more stamps will be added to the mill, and the ore will be concentrated as it was in the past.

GEORGETOWN MINES.—The official figures of the output for the Georgetown district for the present year make an extraordinary good showing thus far, and will do much towards making Grant county's record for this year eclipse that of any previous one by many thousand dollars, notwithstanding the fact that many of the best properties in the county have for various reasons run on short time or closed down for shorter or longer periods. The mines of the Mimbres company have produced from the 25th of January of the present year to date, \$124,616 in bullion, and shipped to the smelter about \$6000 worth of concentrates. To do this they have handled in the neighborhood of 5000 tons of ore, a greater portion of which was broken by leasers for the privilege of which they pay the company one-fourth royalty. The company's mill, under the management of T. B. Pheby, treats the ores extracted by the leasers at about the same price charged by custom smelters throughout the Rocky mountains. The McGregor mine has made a record \$37,774 from January 1st to June 30th, and gives promise of doubling these figures the ensuing six months.

OREGON.

PINE VALLEY.—Cor. *Oregon Sentinel*, Aug. 29: The Pine creek excitement over the new discoveries made this summer, are undoubtedly the best known on this coast. For a permanent camp, it prospects to be one of the best ever discovered yet. Its quartz is of such even nature, and the gold so plainly to be seen with the naked eye that it has astonished the most experienced miner and capitalist. Of what is known as the "Forest Queen mine" which is now bonded for \$40,000 to an Eastern company, a seamless sack of rock and ore was taken out on the 7th, and four men were required to put the sack in a wagon. It was said by many who saw it, that it was almost the pure gold, as chunks were seen as large as a man's hand that were gold only. There is considerable excitement at present in camp over the jumping of claims, and the Princeville law is likely to take effect soon if not stopped. The notice 101 is plainly to be seen tacked in and around camp, with 100 chances to swing to a limb where there is only one chance to get away. There is a daily stage running in to the mines from Baker City and the travel is terrible, an eight passenger coach is loaded daily.

UTAH.

REVIEW.—Salt Lake *Tribune*, Aug. 29: The shipments of bullion and ore out from this city for the week ending Saturday, Aug. 22d inclusive, were 2,216,153 lbs. The receipts of bullion and ore in this city for the week ending Aug. 25th, inclusive, were: Bullion, \$88,510.32; ore, \$8900, a total of \$97,410.32. The week previous the receipts were \$101,342.98, of which \$85,201.99 was bullion and \$16,140.99 was ore. The Ontario shipped for the week forty-six bars of bullion, of the value of \$29,993.77. Total output for the year to date, \$1,002,749.11. The regular monthly dividend of fifty cents a share has been declared, payable in New York on the 31st, the eighth of the year, of \$75,000 each, or \$600,000 altogether. The output of the Stormont during the week was four bars of silver, \$5825. The Hanauer smelter turned out during the week ten cars of bullion, \$23,700. The Germania shipped one bar of fine silver, \$1,377.30, and several cars of bullion, \$72,956.25, a total of \$24,343.55 for the week. Miscellaneous receipts were one silver bar, \$775; Utah gold dust and bars, \$1500; one car copper bullion, \$2900. The Alice, on the 26th, declared its sixteenth dividend of 6 1/2 cents per share,

PATENT
LIFE-SAVING RESPIRATOREntirely Prevents Lead Poisoning
and Salivation

The most perfect appliance for people engaged in Smelting, Dry Crushing, Guano Works, Quicksilver Mines, Lead Corroding, and all other occupations where there is dust, poisonous vapor, or bad odor.

In Feeding Threshing Machines, and similar work, they are indispensable, as no foreign substances can be inhaled when they are worn.

The Respirators are sold subject to approval after trial and if not satisfactory the price will be refunded. Price, \$3.00 each or \$30.00 per dozen. Sent post-paid to any address on receipt of price.

JENKINS PATENT VALVES.

Gate, Globe, Angle, Check and Safety.

Manufactured of BEST STEAM METAL. We claim the following advantages over other Valves and Gauge Cocks now in use:

1. A perfectly tight Valve under any and all pressures of steam, oils or gases.
2. Sand or grit of any kind will not injure the seat.
3. You do not have to take them off to repair them.
4. They can be repaired by any mechanic in a few minutes.
5. The elasticity of the Disc allows it to adapt itself to an imperfect surface.

In Valves having ground or metal seats, should sand or grit get upon the seat it is impossible to make them tight except by regrinding, which is expensive if done by hand, and if done by machine soon wears out the valve, and in most cases they have to be disassembled from the pipes, often costing more than a new valve. The JENKINS Disc used in these Valves is manufactured under our 1880 Patent, and will stand 200 lbs. steam. Sample orders solicited. To avoid imposition, see that Valves are stamped "Jenkins Bros." For sale by

DUNHAM, CARRIGAN & CO., San Francisco, Cal.

THE GIANT POWDER COMPANY

Manufacture Three Kinds of Powder, which are acknowledged by all the Great Chemists of the World as

The Safest and Strongest High Explosives in the Market.

GIANT POWDER or DYNAMITE,
Of Different Strengths as Required.

NOBEL'S EXPLOSIVE GELATINE," which contains 94 per cent of Nitro-Glycerine, an GELATINE-DYNAMITE, Stronger than Dynamite and even Safer in Handling.

JUDSON POWDER IMPROVED.

FOR RAILROADS AND LAND CLEARING. Is from three to four times stronger than ordinary Blasting Powder, and is used by all the Railroads and Gravel Claims, as it breaks more ground, pulverizes better and saves time and money. It is as dry as the ordinary Blasting Powder and runs as freely.

IMPROVED FORM OF HYDRAULIC GIANTS.

The above cut illustrates the IMPROVED FORM OF HYDRAULIC GIANTS, which we manufacture. All similar styles are infringements upon this form, and a judgment stands of record to that effect, under the decision of Judge Sawyer of the U. S. Circuit Court in the matter of Hendy and Fisher vs. R. Hoskin et als.

Prices furnished upon application to
JOSHUA HENDY MACHINE WORKS,
39 to 51 Fremont St., San Francisco, Cal.

IT DIFFERS FROM THE OLD STYLE IN HAVING ONLY ONE JOINT instead of two. It is of greater capacity and more easily worked and kept in repair. The statement of Mr. Hendy that all styles are infringements on the machines made by him, he knows to be utterly false. All litigation has been in reference to old style two jointed machines, which are superseded by our new style one jointed. The decision of Judge Sawyer, referred to by him, is carried up on appeal to U. S. Supreme Court, with absolute certainty of a reversal in our favor. Send for Circulars and Price List.

Market Reports

List of U. S. Patents for Pacific Coast Inventors.

From the official list of U. S. Patents in Dewey & Co.'s Scientific Press Patent Agency, 252 Market St., S. F.

- FOR WEEK ENDING AUGUST 25, 1885.
- 324,912.—RASP.—Jesse Anthony, Covelo, Cal.
324,917.—BILLIARD TABLE LEG.—M. Cashin, S. F.
324,920.—BORING MACHINE.—J. P. Cobb, College City, Cal.
324,923.—CIGARETTE MOUTH PIECE MACHINE.—J. C. Davis, S. F.
324,935.—SUPPORT FOR WHALING GUNS.—J. J. Haviside, S. F.
324,937.—ROCK CRUSHER.—F. A. Huntington, S. F.
324,952.—BUILDING JETTIES.—R. S. Littlefield, Empire City, Or.
325,127.—SUBMARINE WALL.—Daniel Spangler, Hanford, Cal.
324,954.—VALVE GEAR FOR STEAM ENGINES.—A. J. Stevens, Sacramento, Cal.
325,027.—STEAM BOILER.—G. G. Tindall, Oakland, Cal.
324,901.—PIANO FORTE MUSIC RACK ILLUMINATOR.—Ward & Utes, Stockton, Cal.

NOTE.—Copies of U. S. and Foreign patents furnished by Dewey & Co., in the shortest time possible (by telegraph or otherwise), at the lowest rates. American and Foreign patents obtained, and all patent business for Pacific Coast Inventors transacted with perfect security and in the shortest possible time.

Notices of Recent Patents.

Among the patents recently obtained through Dewey & Co.'s Scientific Press U. S. and Foreign Patent Agency, the following are worthy of special mention:

OATMEAL MACHINE.—James C. Holloway, S. F. No. 324,556. Dated Aug. 18, 1885. This invention relates to that class of oatmeal mills in which a rotating perforated rim is adapted to cut the oats against an exterior annular series of knives. The object of the invention is to provide a simple, effective and rapidly-working oatmeal mill of great capacity.

HARNESS CHECKS.—Wm. B. Frost, S. F. Assignor of one-half to Geo. S. Ingersoll. No. 324,765. Dated Aug. 18, 1885. This consists of a check rein of either the form known as "side" or "over" check attached to the bit, passing through the usual guides or runners, and thence to a point where it is attached to the reins by which the horse or horses are driven, and an independent guide or terret.

BEDDING KNIFE.—Harry E. Hulbert, Santa Rosa. No. 324,700. Dated Aug. 18, 1885. The hudding knife consists in a blade suitably mounted in a handle, and provided on its cutting edge, back of the point, with a small piece of a section of a cone taken from vertex to base, and laid with its flat side down and point forward, or resembling somewhat the shape of an ordinary flat-iron. The object is to provide a simple hudding knife adapted to be handled easily, accurately and rapidly.

SMOKE-CONSUMING FURNACE.—Chas. C. Carter, S. F., No. 324,532. Dated Aug. 18, 1885. This invention relates to that class of smoke-consuming furnaces in which a suction blower or fan is connected with the smokestack and with the fire box or the chamber below the grate, whereby the smoke and other products of combustion are drawn from the stack and forced through the furnace again. The invention consists in a conical or inverted funnel-shaped mouth piece, located within the stack, and having a diameter at its base a little less than the diameter of the stack. Said mouth-piece being connected with the suction-blower by a metallic pipe, and provided with ports or apertures controlled by valves or gates. The object is to provide the suction pipe with such a mouth-piece as will nearly fill the stack, thereby catching all the products of combustion and at the same time so constructing it with valved ports that it will not interfere with the natural draft.

WIRE SCREEN STRETCHER.—Chas. Ehrenfeld, Pasadena, Los Angeles Co. No. 324,673. Dated Aug. 18, '85. The invention relates to a new and useful stretcher especially adapted for stretching wire screens over doors, windows, etc., though it may be used for other similar purposes and as a clamp for holding articles and tools to be worked upon, such, for example, as a saw which has to be filed. The invention consists in an adjustable frame adapted to straddle the sash or door stile, and provided with clamps for seizing and holding the screen, a bolt and nut for operating the adjustable frame and clamps; a sliding block between the bars of the frame, and adapted to bear against the outer edge of the stile, and a screw for setting the block up, whereby the frame is moved back and the screen stretched to its place.

OBSTETRICAL SUPPORTER.—Joseph T. Surbaugh, Modesto. No. 324,498. Dated August 18, 1885. The invention relates to that class of obstetrical supporters in which certain straps are so united and operate in unison to provide support and assistance to the patient; and the invention consists in the construction of certain shoulder straps, body and leg straps, stirrups, knee straps and handles and a back supporting strap, and in their various peculiar adjustments. The object is to provide a simple and effective device or harness of this character, which can readily be accommodated to different persons, and which will be serviceable in every

part, each part being adapted to perform its function complete, and the whole to give the necessary relief.

RASP.—Jesse Anthony, Covelo, Mendocino county. No. 324,912. Dated Aug. 23, 1885. This invention relates to that class of files which are made up of separate plates, adapted to rock on their bearings, to enable them to be sharpened; and the invention consists in a series of independent plates, pivoted in transverse rows and united by longitudinal strips, which are suitably clamped to hold the plates in position. The object of the invention is to provide a file or rasp, the teeth of which may be ground, and thus preserve the implement long after it would otherwise be considered useless.

SUPPORT FOR WHALING GUNS.—John J. Haviside, S. F., No. 324,935. Dated, Aug. 25, 1885. The invention relates to a whaling-gun and the stand by which it may be supported within the boat, so as to resist the recoil or kick of the gun when fired. It consists of three barrels fixed side by side, the central one being adapted to discharge the harpoon by which the whale is made fast, while the two exterior barrels may discharge bomb-lances, which serve to kill the animal. The lock of the gun contains three hammers, all actuated at the same instant, so that all the barrels may be discharged at once. The apparatus is supported upon a peculiar stand, whereby the gun may be properly aimed and then locked, so as to resist the recoil or kick when fired.

HARVESTER.—Daniel Houser, Stockton, No. 324,697. Dated Aug. 18, 1885. This invention relates to certain improvements in apparatus which is designed to cut, thresh, separate and clean the grass at a single continuous operation, the machine being drawn about the field by a team or other suitable power. It consists of a frame having the threshing, cleaning and sacking mechanism supported upon it, and suitable bearing wheels therefor, a second frame hinged to and projecting from one side of the threshing apparatus and supporting the cutting and conveying mechanism, or the construction of the frame and the manner of supporting its outer end, and in the means of raising and lowering the sickle.

TYPE WRITING MACHINE.—Edwin S. Belden, S. F. No. 324,520. Dated Aug. 18, 1885. This is an improvement in calligraphs, the object of which is to give each letter or other character approximately suitable space, according to the requirements of its width. A previous application has been made by the same inventor for an improvement, the object of which was to make the last letter of a word and the space following it at the same time. This was accomplished by the mechanism operated by the space bar or key, which permitted the paper carriage to move a greater distance than any of the type keys could effect. The present invention embodies a part of that mechanism, conducting to the same end of permitting a varied movement, between suitable limits, of the paper carriage; but the present mechanism is essentially different in the graduated stop and the means employed for calling it into action, as the result to be attained is of a different nature.

COUPLING FOR CONNECTING PIPES.—John J. Lacey, S. F., assignor to Lacey Automatic Coupling Co., of Oakland. No. 324,031. Dated Aug. 11, 1885. This is a joint or coupling for pipes which are supported on structures, one or both of which may be subjected to irregular, transverse or other movements; and it is especially applicable to the coupling of pipes which carry air, steam, water, etc., beneath railway carriages. It consists of adjustably supported pipe ends at the adjacent or meeting ends of two cars, so constructed that one may slip into the other as the cars approach, a means for the automatic opening of a passage of one pipe to any other when they meet, a means for rendering the joint, steam, water or air tight while allowing the pipes a side or end play to accommodate them to the motion of the cars; a protecting cap or cover for the open or hell mouthed coupling end, and an arrangement by which the coupling device may always be used, whichever ends of the cars may come together.

BOILER-TUBE EXPANDER.—Michael Cashin, S. F., No. 324,007. Dated Aug. 11, 1885. In implements of this class, a guard, either in the shape of an annular band or of two short arcs or lips, is generally present. The object of the guard is to limit the insertion of the expanding block of the implement. It bears against the tube sheet while the rest of the implement is being rotated. The inventor considers that both these forms of guards are disadvantageous in confining or limiting the use of the expander. In some boilers the tubes are closer together than in others. An expander provided with a guard of fixed diameter, while adapted for use on boilers in which the separation of the tubes is such as to permit the guard in being seated against the tube-sheet to avoid the ends of adjacent tubes when the expanding block is inserted in the tube then to be operated on, is not adapted for use on boilers in which the tubes are separated by a distance less than the diameter of the guard, as in that case the lips of the guard would come in contact with adjacent tubes. It is the object of Mr. Cashin's invention to provide a guard adapted to be extended or contracted and set where desired, thus adapting it for use in boilers, no matter what may be the separation of the tubes.

Inducements to Subscribers.

To favor subscribers to this paper, and to induce new patrons to try our publication, we offer the following advantages to all new subscribers who pay one year in advance, or present subscribers who will pay their subscription up to a date fully one year in advance of the present time. We will furnish the following articles (while this notice continues), at the reduced rates named, viz:

- | | RETAIL PRICE. |
|--|-----------------------------|
| 1.—World's Encyclopedia, 794 pages, with 1,200 illustrations, worth \$1.75. | Postpaid for 50 cts. |
| 2.—Patent Binder (cloth cover) with name of this paper in gilt. | Postpaid for 50 cts. \$1.00 |
| 3.—To New Subscribers, 12 select back Nos. of the Rural Press. | Free .75 |
| 4.—Any of Harper's first-class periodicals, 15 per cent less than regular rates. | |
| 5.—Frank Leslie's and most other U. S. periodicals, 15 per cent discount from regular rates. | |
| 6.—Pacific Coast and Eastern Dailies, Books and Periodicals, except special publications, we can usually give 10 to 15 per cent less than advertised retail rates. | |
| 7.—Pictorial Arizona, 350 pages, in cloth and gilt. | Postpaid for 25 cts. 1.25 |
| 8.—California, 100 pages, Magazine, 1880 to 1882 (3 Vols.) single No. | Postpaid for 3 cts. .35 |
| Per volume, unbound, 5 Vols., Postpaid for 20 cts. | 2.00 |
| Per volume, bound, cloth back and stiff paper sides. | Postpaid for 40 cts. 2.50 |
| 9.—Pictorial California Homes (10 build-ing plans and estimates). | Postpaid for \$1 3.50 |
| 10.—Dewey's Patent Newspaper File Hold-er (18 to 36 inch). | 25 cts. .50 |

NOTE.—The cash must accompany all orders. If too much is sent for any article or publication, the balance will be returned immediately. Address this office, No. 252 Market St., S. F.

P. S.—No. 11 is really a valuable premium to new-comers and others who appreciate the better class of stories and a good standard of California literature.

- | | |
|--|--------------|
| Webster's Dictionary, 634 pages, with 1,500 illustrations. | 50 cts. 1.50 |
| Grant Lithograph, size 24x19. | 50 cts. .50 |
| Cleveland Fine Steel Plate, size 12x18. | 10 cts. .50 |

| De Groot's History of Mining in California. | 5 cts. .25 |
| Beautiful Poetic Review, a handsome, enter-taining and instructive souvenir of real merit. | 25 cts. .50 |

Send for any further information desired. Readers will please inform their new neighbors and others concerning our paper and these offerings. On application, sample copies of this paper will be mailed free to the address of any persons thought likely to subscribe.

ORDERS have been received from Wash-ington to resume work at once on the new stone dock at Mare Island Navy Yard. It is anticipated that a general resumption of work will take place in a day or two. The 12 boilers for the dock are to be built by the Steam Engineer-ing Department, and a number of stonecutters, masons and laborers will be given employment about the dock. The outlook for work in other departments is not bright.

TWENTIETH Industrial Exhibition OF THE MECHANICS' INSTITUTE

Opens August 25th, Closes Sept. 26th.

With a most Comprehensive display of MANUFACTURES, NATURAL PRODUCTS AND ART.

DEWEY & CO.'S

Scientific Press Patent Agency. [ESTABLISHED 1860.]

Inventors on the Pacific Coast will find it greatly to their advantage to consult this old experienced, first-class Agency. We have able and trustworthy Associates and Agents in Wash-ington and the capital cities of the principal nations of the world. In connection with our editorial, scientific and Patent Law Library, and record of original cases in our office, we have other advantages far beyond those which can be offered home inventors by other agencies. The information accumulated through long and careful practice before the Office, and the frequent examination of Patents already granted, for the purpose of determining the patentability of inventions brought before us, enables us often to give advice which will save inventors the expense of applying for Patents upon inventions which are not new. Circulars of advice sent free on receipt of postage. Address DEWEY & CO., Patent Agents, 252 Market St., S. F.

A. T. DEWEY,

W. B. EWER,

GEOR. H. STRONG,

DELINQUENT NOTICE.

Grosh Consolidated Mining Company.— Location of principal place of business, San Francisco, Cal. Location of works, Storey County, Nevada.

NOTICE.—There are delinquent upon the following de-scribed stock on account of assessment No. 1, levied on the 13th day of July, 1885, the several amounts set op-posite the names of the respective shareholders, as follows:

NAME.	No. CERTIFICATE.	No. SHARES.	AMOUNT.
Fleming, A.	11	5	25
Fleming, A.	45	21,985	1,249 25
Fleming, A.	18	11,500	675 00
Fleming, J. B.	7	12,500	625 00
Fleming, J. B.	19	5	25
Fleming, J. B.	46	24,990	1,249 50
Hastings, E. O. F.	40	2,500	125 00
Mcquaid, A. J. Trustee.	14	12,185	624 25
Mcquaid, A. J. Trustee.	49	24,001	1,200 00
Mason, A. J.	51	36,001	1,800 00

And in accordance with law and an order of the Board of Directors, made on the 13th day of July, 1885, so many shares of each parcel of such stock as may be necessary will be sold at public auction at the office of the Com-pany, on Monday, the 31st day of August, 1885, at the hour of 10 o'clock A. M. of said day, to pay said delin-quent assessments thereon, together with costs of ad-ver-tising and expenses of the sale.

A. C. HAMMOND, Secretary.

Office, room 39, Merchants' Exchange, San Francisco, California.

POSTPONEMENT.

The delinquent sale of the above assessment is hereby postponed until Monday, September 1, 1885. By order of Board of Trustees.

A. C. HAMMOND, Secretary.

Dated August 25, 1885.

THE ORIGINAL Roller Ore Feeder.

(PATENTED JUNE 24, 1873.)

This form of Ore Feeder is well adapted for its peculiar work.

Manufacturers of the Celebrated "Chal-lenge" Ore Feeders for any character of ore; also "Stanford Improved" Ore Feeders and Tullock's Ore Feeders for dry ore.

HOOD'S FOUNDRY COKE.

Consumers are respectfully informed that owing to inferior brands of Coke having been sold
in this and other countries under the name of "Patent Coke," the Glamorgan Coal Co.
(Limited), Cardiff, in May, 1884, abandoned the title of "Patent Foundry Coke," substituting
that of "Hood's Foundry Coke."This Coke is exclusively used by the Selby Smelting and Lead Co., Union Iron Works,
Professor Thomas Price, and other consumers here. Large quantities are regularly forwarded
to Copper Smelters in Arizona and New Mexico, and also to consumers in Nevada and Salt Lake.The undersigned are the **SOLE IMPORTERS** of the above Coke, which is for sale in quanti-
ties to suit purchasers.**BALFOUR, GUTHRIE & CO.,**

316 California St., San Francisco.

HEINE PATENT SAFETY BOILER.

RISDON IRON AND LOCOMOTIVE WORKS.

Sole Agents for the Pacific Coast, Corner Beale and Howard Sts., San Francisco.

FIRST PREMIUM AWARDED at MECHANICS' FAIR, 1884.Economy in space and fuel. Safety at high
pressures. Freedom from scaling. Equally
adapted for power and heating purposes.
Especially adapted for mills, factories, hotels,
stores or any place where safety is a necessity.
Will work well with muddy water and any kind
of fuel.

TESTIMONIALS.

SAN FRANCISCO, Sept. 19, 1884.

Risdon Iron and Locomotive Works—Gentle-
men: We have had one of your Heine Patent
Safety Boilers in use for four months at our
Borax Works, in Alameda. It does good work
and gives perfect satisfaction. Yours truly,
(Signed) WM. T. COLEMAN & CO.

SAN FRANCISCO, Oct. 4, 1884.

Risdon Iron and Locomotive Works—Dear
Sir: I am using one of your Heine Patent
Safety Boilers in my Candy Factory on Twenty-
Third street, near Valencia. For economy of
fuel, safety and efficiency I have never seen its
equal. Very truly yours,
(Signed) W. S. TOWNSEND.

\$1,000 CHALLENGE!

**THE FRUE ORE CONCENTRATOR,
OR VANNING MACHINE.**

**PRICE: FIVE HUNDRED AND SEVENTY-FIVE DOLLARS,
(\$575 00), F. O. B.**

OVER 1,000 ARE NOW IN USE. Saves from 40 to 100 per cent more than any other Concentrator in working order and ready to make tests at the Fulton Iron Works, No. 220 Fremont Street, San Francisco. As the result of a suit East against an End-Shake Machine (the Embrey), similar to the Triumph, the Frue Vanning Machine Company owns the Embrey patent, and can put in the market an End-Shake Machine of earlier patent that will do as good work as the Triumph, and superior in construction and durability. There will be no risk of suit for infringement. The Frue Vanning Machine Company warn the public that they claim and will prove the Triumph machine to be an infringement on patents owned by them. Protected by patents May 4, 1860, Dec. 22 1874, Sept. 2, 1879, April 27, 1880, March 22, 1881, Feb. 20, 1883, Sept. 18, 1883. Patents applied for. N. B.—We are and have been ready at any time to make a competitive trial against the Triumph, or any other Concentrator for stakes of \$1,000.

MINING MACHINERY.

San Francisco: 127 First Street. Chicago: 100 N. Clinton. New York: 145 Broadway.

PLANTS FOR GOLD AND SILVER MILLS, embracing machinery of LATEST DESIGN and MOST IMPROVED construction. We offer our customers the BEST RESULTS OF 35 YEARS' EXPERIENCE in this SPECIAL LINE of work, and are PREPARED to furnish from SAN FRANCISCO or CHICAGO, the MOST APPROVED character of MINING AND REDUCTION MACHINERY, adapted to all grades of ores and SUPERIOR to that of any other make, at the LOWEST POSSIBLE PRICES.

We are also prepared to CONSTRUCT and DELIVER in COMPLETE RUNNING ORDER, in any locality, MILLS, CONCENTRATION WORKS, WATER JACKET SMELTING FURNACES, HOISTING WORKS, PUMPING MACHINERY, ETC., ETC., of any DESIRED CAPACITY.

WATER JACKET SMELTING FURNACES

For COPPER and ARGENTIFEROUS LEAD ores of NEW and ORIGINAL DESIGNS, covered by LETTERS PATENT. No other Furnace CAN COMPARE with these for DURABILITY, and in CAPACITY for uninterrupted work. MORE THAN 150 of them are now RUNNING in various parts of THIS COUNTRY, as well as many in FOREIGN COUNTRIES, giving results NEVER BEFORE ATTAINED as regards CONTINUOUS running, ECONOMY of fuel, AMOUNT and QUALITY of BULLION produced. These CLAIMS have been PROVEN BY RESULTS in ANY NUMBER of INSTANCES, and the GREAT SUPERIORITY of this SYSTEM of smelting ores DEMONSTRATED BEYOND QUESTION. COMPLETE PLANTS furnished to order of any CAPACITY, with ALL IMPROVEMENTS that experience has DEMONSTRATED as VALUABLE in this class of work.

Beyond question the cheapest and most effective machine of the kind now in use adapted to all grades and classes of ores.

This machine has been THOROUGHLY TESTED for the past TWO YEARS, under a GREAT VARIETY of CONDITIONS, giving most EXTRAORDINARY results FAR IN ADVANCE of anything EVER BEFORE REALIZED. A recent COMPETITIVE TEST at the Carlisle Mine in Mexico, showed an ADVANTAGE OF OVER 30 PER CENT in favor of THE DUNCAN. The amount SAVED OVER THE TRUE being sufficient to PAY THE ENTIRE COST of the machines EVERY MONTH OF THE YEAR. One of its MOST VALUABLE features is as an AMALGAMATOR. It saves all THE AMALGAM GOLD and SILVER that ESCAPES THE BATTERIES, PANS or SETTLERS, making the machine worth MORE than ITS COST for THIS PURPOSE ALONE.

Baker's Mining Horse Power.

Possessing all the requirements of a first-class hoist, and affording means for the continuous operation of a Pump or Blower, without interfering with a hoisting apparatus. It is made entirely of iron, no piece weighs over 300 pounds. At the ordinary speed of a horse, a 1,000-pound bucket of ore may be raised 120 feet per minute. The hoisting-drum is under the complete control of the man of the shaft, and is capable of carrying 500 feet of five-eighths steel rope. SEND FOR CIRCULAR.

Granzita Furnaces.

At the New Almaden quicksilver mine, in Santa Clara county, this State, the ores are classified and the classes of ore are treated in different furnaces specially adapted to them. After the cleaned ores are transported to the ore-chutes and tried at the hacienda, they are still further classified, partly by screens in the ore-chutes, and partly by screens on the top of the ore cars. By this means a new class of ore is introduced, intermediate in size between the *tierras* and the *granza*. This class is called *granzita*. The screens at the ore-chutes are mostly made of cast-iron plates, with 1½-inch square holes arranged in diagonal rows across the plate. These separate from mine *tierras* and *granzas* a certain quantity of coarser fragments (called *granzita*), that has passed the bar screens owing to the shape of the fragments or the spreading of the bars. One of the furnaces for treating this *granzita* is described by Mr. S. B. Christy, before the American Institute of Mining Engineers.

The furnace shown in the engraving is No. 2. Having only two ore chambers its maximum capacity is only half of that of No. 1; its discharging arrangement is simple also, owing to the small number of ore chambers. The figures need no further remark, except that while sections *A B* and *C D* show the pigeon-holes, section *E F* is so taken as not to show them.

The hoppers on top of this furnace are arranged in the same line, and feed into the same ore-chambers; but they are divided into compartments, so as to permit more control over the operation of the furnaces. These compartments are charged with 1000 pounds of ore (when in full operation) every 40 minutes, alternating with each other. This would make the working capacity of the furnace 18 tons per 24 hours. The drawing precedes the charging. In drawing, 250 pounds are taken from each of the two end draw-pits on each end of the furnace, or 1000 pounds (volume) at a time. The drawings, from either end of the furnace, alternate with each other every 40 minutes.

No fuel is charged with the ore of this furnace, but instead, coal is used in the fireplace. The consumption of fuel is 3 cord of wood and 500 pounds of coal per 24 hours.

When this furnace is run alone, there are employed: One charger and 2 fire-or-slag-men per 12-hour shift, or six in all per 24 hours. When No. 1 and No. 2 are both in operation at the same time, labor is economized by running them with the same force. For this purpose are assigned:

One charger; at \$2.50 per 12 hour shift.

Four slag or firemen, at \$1.25 per 12 hour shift.

In addition, two men are employed part of the time to bring the ore from the chutes to the furnace-bins. This furnace is not always run up to its full capacity, only enough ore being run through it to make up the desired monthly production.

The placer diggings of Similkameen, B. C., are represented to be very rich, as much as \$50 a day being carved with rockers.

The New River Region.

We had a conversation this week with Mr. Yokum, of Humboldt county, who has recently visited the New River mines, in Trinity county. He is impressed with the fact that the section is one which in course of time will prove a rich one, though at present development is retarded from lack of reduction facilities. There is quite

out may be worked. There is one small 5-stamp mill which worked custom rock for a while, but the owners are now crushing their own ore. Miners have all the way from 25 to 100 tons of ore out on their dumps, but they cannot do anything with it at present. There are many good mines, and in a year or so, when there are mills, the region will be a prosperous one. Mr. Yokum is satisfied that a few

GRANZITA FURNACE FOR QUICKSILVER ORES.

a number of men prospecting thereabouts, and many mines are being opened. Most of the men, however, are not financially able to do much. They have taken out rock from their prospects, but are not able to have it crushed or worked.

About the deepest shaft so far sunk is 80 or 90 feet. The mine that has been most worked is the Hard Tack, and it improves as depth is attained. The ledge is from one to three feet wide. It pays in an *arastra* about \$100 per ton.

What the country needs badly is some little capital for custom mills, so that the rock taken

mills could get all the work they needed for some time to come, with only the ore now out. And, of course, with any encouragement more would be raised. There is a strip of country on the mountain side, four or five miles wide and seven or eight miles long, which is being prospected, and discoveries are also being made outside of this belt.

THE British Museum has just received the great Hume collection of Indian birds. There are 63,000 specimens, of which 50,000 are new, thus making the museum's collection an unapproachable one.

Flue and Chamber Dust.

Leadville being situated at an elevation of 10,000 feet above the sea, the volume of air blown into a smelting furnace with a given blast pressure is far greater than with the same pressure at sea-level; consequently the draught of the furnace is correspondingly increased, and the quantity of dust and fumes escaping by the stack is very large. This would seem to necessitate the employment of a very perfect system of condensing flues and chambers. In point of fact, however, Mr. S. F. Emmons in his monograph on Lead Smelting at Leadville, published by the U. S. Geological Survey, says these arrangements are, with one or two exceptions, very poor, and consequently a large proportion of the dust and fumes is lost in the air.

Their composition is extremely complicated, and is characterized by the presence in considerable quantities of chlorides, iodides, bromides and phosphates. They carry from 25 to 60 per cent of lead, the latter figure applying to the fumes condensed in the Bartlett filter, and from 30 to 40 ounces of silver to the ton, although the Bartlett filter fumes held but 4.3 ounces. The composition of the latter is otherwise remarkable in that they contain over 11 per cent of phosphate of lead, 9 per cent of chloro-bromo-iodide of lead, and 18 per cent of sulphide of lead, and from the further fact, according to Mr. Guyard, that even zinc and manganese exist in their entirety in the state of sulphides.

It must be borne in mind however, that these fumes were condensed at a distance of 200 feet from the furnace. Mr. Guyard has calculated the weight of calcined dust collected from one furnace of 30 to 40 tons capacity during 24 hours at 1400 pounds, and estimates that where the filter is not employed, the loss of lead equals half a ton of silver, 4½ ounces per day of fineness. On this assumption more lead is lost in the air than is collected in the dust chambers. The chamber and flue dust is mixed with lime and thrown over the ore beds to be resmelted. In one smelter the flue dust is prepared for resmelting by melting down in a reverberatory furnace at first with, and now without, the addition of slag. It is then run out, and after cooling it is broken up and mixed with the charges.

THE Elk rapids, Mich., Iron company have received an order for 300 tons of charcoal iron, to be shipped to England, probably the first iron of a Western manufacturing company ever shipped from this country.

ORDERS have been received from the United States Adjutant General's office at Washington, relieving Lieutenant Robert Craig from the Signal Office of this city and ordering him to report for duty at Washington.

THE Indians are leaving Belleville, Nev., on account of some strange disease which is carrying them off. They are much alarmed and are going to new camping-grounds as fast as they can get their ponies to travel.

CORRESPONDENCE.

Why Mines do not Sell.

Bonding Claims.

EDITORS PRESS:—In an article in the PRESS of Aug. 8th, headed "Why Mines do not Sell," "Experience" has mentioned some very good reasons why they do not sell, but mine owners are not to blame altogether.

To begin with, he refers to a gentleman in San Francisco, who he says is always ready to undertake the sale of a mine that can stand an honest test. Now, what need has a mine owner for any one to sell his mine if it will stand an honest test? The trouble is, capitalists have been in the habit of buying mines of middlemen, or, in other words, speculators. The owner of a mine will ask all it is worth; the middleman must have from one to ten thousand dollars or more for making the sale, consequently he must sell it for that amount—more than the owner is really willing to take.

Another trouble in the mining camps is that of bonding mines to men who only want to speculate on other people's labor and are not willing to do a day's work on a mine or put up a dollar for the bond. It should be very plain to capitalists that they can buy a mine cheaper from the owner than they can from the man who has it bonded and with less chance of chicanery and fraud.

The fact is there are many mines in California that would prove valuable properties and can be bought at reasonable prices, if capitalists will buy direct from the owners or through reliable agents. By mine owners I do not have reference to the man who without labor or capital has secured some worthless mine which he expects to sell for a fortune or the man who is sitting over a prospect hole ten feet deep waiting for something to turn up. I have reference to those who go at it with a will and develop their mines sufficiently to show that they have a mine or those who by their good judgment and capital at their command have several mines that are sufficiently developed to show that they are permanent and valuable.

Quite frequently you will see men in the mining camps claiming to be looking for a mine for parties with plenty of capital. They will usually want to bond your mine for six or twelve months. If you tell them you will not give the bond unless they agree to do a certain amount of work or make a small payment, they will most invariably tell you, shortly after, that they are called away on important business, but will be back in a short time and will see you again. Now when they take their departure you had better take a good look at them and hid them good-by, for nine times out of ten you will never see them again.

When men come into a mining camp wanting to bond mines without agreeing to do any work or advance any money on them, or wanting to sell your mine for you for the consideration of a few thousand dollars in case the sale is made, the thing for mine owners to do is to sit down on them, as it is evident capitalists are doing; which, by the way, may be the reason the gentleman in San Francisco referred to by "Experience" has not made three sales in the State in 20 years.

There are also many mines in California owned by men of capital that have not been remunerative, simply because of extravagance in operating them often through superintendents who know little or nothing about mining; or the keeping of a surplus of bosses who fill the place of the fifth wheel on a wagon.

The appearance of things now would indicate that Eastern capitalists think we have but few good mines in California. There could be much said in regard to the way mines are often managed by Eastern capitalists, showing some of the reasons why they have not made a success of mining. However, I will say no more at present.

A MINE OWNER.
Georgetown, El Dorado Co.

Nogales.

EDITORS PRESS:—This little town where your correspondent has for the present the fortune or misfortune, as the result may prove, to reside, is interesting from the circumstance that it is the gateway between the United States of North America and the United States of Mexico, via the State of Sonora.

The town, or village, rather, lies about equally on both sides of the boundary line, which, at this point, is marked by a monument twice determined by astronomical observations, as I am informed, and therefore likely to be permanent.

The population, including the entire village, numbers some two thousand, of whom a majority are Mexicans. The chief support of the place has been the Sonora trade, both legitimate and otherwise, that is, smuggling, the local resources being inconsequential.

The altitude above the sea is somewhere about 4000 feet; the climate is all that could be desired, and the people on both sides of the line are peaceful and law abiding, as a rule.

The rock formation of the immediate locality appears to be a lacustrine deposit, which forms a soft white stone, excellent for building pur-

poses. At some points this deposit is tilted at an angle of about 35 degrees; a little to the northward it remains horizontal. The structure is generally fine-grained, but there are layers of quite coarse gravel. On the surface, in many places is a thin stratum of loose washed gravel among which occur many fragments of heavy, black, non-magnetic iron oxide with quartz gangue, and occasional pieces of gold-bearing quartz have been found.

At a depth of from 20 to 40 feet and more, according to locality, a flow of good water is encountered, and this water comes to the surface, or rather, the surface descends to its level, about nine miles northward from the village, in the valley of the Santa Cruz river, which flows past Tucson. The location of the town is in a narrow valley, bounded on the east by rather high, and on the west by quite low hills. There are no mines in the immediate vicinity, though a prospect has been found seven miles northward, which, beginning with an assay value of 11 ounces of silver to the ton, has steadily improved until of late some very rich containing horn silver has been found.

The recent Yaqui war in Sonora, and increased vigilance on the part of the Mexican customs officials have had a disastrous effect on the business of the place, which, however, shows signs of reviving, despite the Apache scare and the recurrence of yellow fever in Guaymas. The latter circumstance, unfortunately for Guaymas, is expected by some to inure to the benefit of Nogales by making this the chief port of entry for Northern Sonora.

The prosperity of Nogales has been very little, if at all, disturbed by the fact that its title is claimed under an alleged Mexican grant as the "Nogales de Elias Rinch." This grant is claimed to have originated some 150 years ago, yet, up to this time, it has not, so far as I can ascertain, been recognized or confirmed by the general Government of Mexico, and certainly not by the United States Government.

Four men, of whom at least three are Mexicans, claim to represent all the heirs to this estate, of whom a large number are minors, and are offering to sell lots and ranches, to those already in possession, for prices which would, in many cases be high even if they could give title, whereas, they themselves, having neither title nor possession, only offer a quit claim. On the Mexican side of the line, the grant claimants give some sort of warranted deed, but on our side they refuse to do this. About a year ago, the then agent of these men told me that they would contract for the sale of lots at stated prices, but would not accept one cent of payment until they could give title. They have changed all that, however: have appointed a new agent, and are going for all the ready money they can get, which is not very much. A few of the citizens, thinking to obtain peace and security, have yielded to the demands of these people, and are paying them for what will most likely prove to be Government land. The great majority, warned by the experience of Californians, and having faith in the honesty of the present government, have determined that they will not pay tribute to foreign claimants under a foreign title, but will await the decision of their respected Uncle Sam.

Nogales, Aug. 29, 1885. C. H. A.

IDAHO GOLD.—Frank Reed writes from Murray, Idaho, to J. W. Hellsborn amongst other things the following items of interest concerning that country: "I think I have struck a streak of good luck at last, and expect to get away from here with all the money I will want. This is going to be a great mining camp; I have seen more rich ore here than I ever saw before outside of old Bodie. There is a New York company here buying up all the deep channel; they are going to put in a bedrock flume over eight miles in length on Pritchard creek, and they are investing in quartz heavily. I expect to make a big sale as soon as I get my property opened up in good shape. This is a big country and no end to the mineral. The ledges are deeply covered and nearly all are capped over with bedrock or a heavy cement, which makes it very hard for the prospector. Several good sales have been made to Salt Lake, Denver and Black Hills parties. We have a stage now which connects with the steamer at the old Mission, and it makes it a very pleasant trip from Rathdrum, or rather Spokane Falls, W. T., a distance of 100 miles. The hill diggings are good. The great drawbacks to our camp were schemers who got bold of the water right, which kept our camp back very much. It is now coming up on its merits, which is the only thing that makes a mining camp. They clean up gold here by the panful. I have taken as high as \$29 out of one pound of quartz, and have specimens in my cabin that are one-half gold. My claim is called the Buckeye; the ledge is 5½ feet thick. I have run a tunnel in quartz now 58 feet and 70 feet from the surface—that is, from the end of the tunnel. I expect next month to put up a mill on this property."

—Bodie Free Press.

PIONEER EGGS.—A dredger at the foot of the old Vallejo-street wharf, in this city, brought up last week from under twelve feet of mud a number of glass jars with lead covers, which, when opened, were found to contain eggs. As it was in this manner that Eastern eggs were shipped to California in '49 and '50, it is thought these specimens formed part of one of the old-time shipments. The yolk and white has shriveled up into a small hard ball, which rattles about in the shell.

Silver.

"An Allegory."

And now Mr. Geo. H. Southard, of the California Redwood Lumber company, has given his opinion on the silver question. In his own lumbering way he has decided that silver, as money, should be abolished, and that the Constitution of the United States should be so far set aside as to give Mr. Secretary Manning the management of the coinage question. May he that ought to fix the whole business. It is just possible that Mr. Southard has devoted as much as fifteen minutes to the consideration of the question, and that he has determined the business absolutely. He is incensed that silver miners can sell their bullion—not for gold, as he says, but silver—and says in a that-settles-it tone, "Let them send their silver to London." Suppose the same tactics should be adopted toward the business of Mr. Southard, what would he think? Suppose Congress should pass a law excluding these redwood lumber in the building of houses and fences, on the ground that it had a fashion of shrinking endwise. What would this new financial light think about it? Would he not protest and declare that pine shrunk worse than redwood, and that the chief uses of the lumber were for house and fence building? Probably he would, but the answer to that would be, "No matter; the chief use of silver among men was money for these thousand years, before the first saw-mill was invented, while yet men lived in tents and caves and fissures of the immemorial rocks. What are Mr. Southard's troubles to the Government of the United States? Is it not true that redwood shrinks endwise, and does not that fix the business? With that decree in force, redwood lumber would be apt to shrink somewhat in value, would it not, and pine would rapidly advance? How would it strike Mr. Southard should some grave financier come along and say to him: "I know that for a hundred purposes this redwood board is a better material than pine, but the intrinsic value of the pine board is sixteen times that of redwood." Would not Mr. Southard in righteous wrath cry: "You are a hopeless fool. Can you not see that the falling off in redwood is due entirely to the most stupid and wicked legislation that was ever inflicted upon a suffering people?" Would he not go on and explain that just at a time when the market was short of pine and the people needed lumber for building the law was passed; that as a result the price of pine had advanced clear beyond their means to purchase, and that now women and children were suffering for want of shelter, and that half-grown crops were being overruled because the farmers could not fence their fields? Would it help his peace of mind to know that the law was suggested and urged to a passage by a combination of men who had some stocks of pine lumber on hand, and that their purpose was to secure a corner on lumber? There is just one question to decide about silver. Is there gold enough in the world to make a full and sufficient standard of value? If there is, why then silver is merely merchandise. If there is not, then the miners are not to be the men who will suffer most when silver shall be discarded as money. It will be the men who carry on the world's work, who have to borrow money and overdraw their bank accounts sometimes, and the class who never have any bank account, but who have to depend upon their daily work to gain for themselves daily bread.—Salt Lake Tribune.

DEEP MINING IN BUTTE.—The fact that the Hale and Norcross Mining Company, of Virginia City, recently shipped \$5000 worth of bullion milled from ore extracted at a depth of 3000 feet, is noteworthy in the history of Western mining. From no mine on the American continent was such a shipment ever made before. It seems to illustrate the grand possibilities of deep mining. There is no reason known to science why the precious metal ore should not be found as rich and abundant at a depth of 3000 feet as 300, and experience shows in the Hale and Norcross that the silver deposits are practically without limit in depth. What is true of the Comstock may reasonably be expected to prove true of Butte. In no mining camp in the world are the silver ledges so extensive, so uniform in dip and strike and so regular as to width as are the great fissures of this district. At times the ore may be a little lean or refractory, but in no case do the walls come together. In the Alice, in the Lexington, in the Moulton, and in all the copper mines, whether the ore bodies are 10 or 50 feet wide, the walls are always uniform. Faults and displacements do not occur to mar their regularity. They descend generally at an unvarying angle straight into the earth. Ore bodies may "make" or may "pinch" but cross-outs will always find the walls in the mines of Butte. They are as true as the needle to the pole. It is this fact that renders the problem of deep mining at Butte so full of promise. The geology of the camp favors the theory of regular walls with plenty of room between them for mineral deposits as far as modern machinery can sink. The *Inter-Mountain* is firmly of the conviction that before many years it will be called upon to chronicle the shipment from some of the silver mines of Butte the bullion product of some 3000-foot ore, and that sinking will still be in progress.—*Inter-Mountain*.

Soda from Owens Lake.

Very little attention, says the *Inyo Independent*, has yet been bestowed upon the project for getting soda by the evaporation of Owens lake water. A little investigation made recently reveals the fact that this work now going on is one of the most gigantic projects ever undertaken. The value of the material to be secured is so enormous that the figures are startling. The area of the lake is 110 square miles; taking the average depth at only 10 feet—and this is too little—and it is easy to calculate the value of the matter held in solution. From a multiplicity of tests already made the proportion of the various salts contained in the water is well known. From the data given above, and on the basis of the average of the tests referred to, the quantity of carbonate of soda contained in the lake is 22,000,000 tons. This article is worth \$30 per ton; total value of carbonate of soda contained in the lake, \$660,000,000. Surely these are startling figures. But this is not all; the water also contains 5,000,000 tons of sulphate of potash, worth \$20 per ton; total value of sulphate of potash \$100,000,000; value of carbonate of soda and sulphate of potash combined, \$760,000,000. Surely these are startling figures. The lake also contains about 20,000,000 tons of chloride of sodium—common salt—and 6,000,000 or 7,000,000 tons of sulphate of soda; no value is placed upon these. The annual evaporation of the lake averages five feet; if Owens river were turned aside the whole water of the lake would therefore evaporate in two years. There is land enough in Owens valley on which all the water of the river could be used for irrigation. It is now well established that an annual supply of 24 inches of water on each acre of land is an ample supply for all kinds of crops. But say that 30 inches would be required; then the water now flowing into the lake would irrigate 140,000 acres of land. Every acre of that amount is within easy reach of water from Owens river. If supplied with water this land, now valueless, would be worth \$20 an acre; here is another value of \$2,800,000. The work of securing these enormous values is already begun; the conditions for success are all there; the prize is so great to be relinquished, and nothing short of some terrific convulsion of nature will prevent the realization of the scheme. No one will be injured by the success of the projectors; the world will be enriched just as effectually as if the values had been called suddenly to existence by creative power.

SALE OF IRON MOUNTAIN.—It affords the *Democrat* great pleasure to chronicle the transfer of the Iron Mountain silver mines to San Francisco parties of wealth and experience. The trade was closed in the city last week, and as we are informed the purchase price of \$200,000 was paid into the Bank of California on Saturday. Mr. James Sallee, one of the late owners, came up from the city on Friday evening, and Mr. Sharp, late foreman of the mine, followed him on Monday. We learn that Mr. Sallee has secured the contract from the new owners of the property to build a road from the mines to Copley, and to put up a saw-mill at the mine for the purpose of getting out mining timbers and heavy foundation pieces for a 20-stamp mill. He begins work at once on the road. This is the best thing for Shasta county that has happened in a long time. While the old owners of the mine appreciated its value they did not work it on a very large scale and never employed many hands. Under the new management we can look for an active mining campaign, as the mines will be opened in a careful and business-like shape so as to produce billion and pay dividends. This sale will open the eyes and call the attention of other capitalists to our vast mineral region, and we firmly believe that other transactions will follow in the wake of this big transfer. From Iron Mountain to the Balaklava, a distance of nearly four miles we have a belt of gold and silver ore of astonishing dimensions. In some places the croppings of the lode are exposed on the surface for a width of 100 feet and over. This big lode is a mineral wonder. Now that capital with its magic wand has attacked it we can confidently look for an out-turn of bullion that will surprise the mining community.—*Shasta Democrat*.

SWEETWATER DISTRICT.—The mining prospects at Sweetwater are just now looking bright. On the Patterson Consolidated, says the *Carson Free Lance*, there are at work eight men, with the prospect of a much larger force to be put to work in a short time. Mr. Kilpatrick, a one half owner in the mine referred to, said to the writer the other day that they had every reason to believe that within six months Sweetwater would have such a boom as hitherto she has never known. In fact, he said if the public knew of the present developments of the mines in the camp, there would now be a great excitement and a rush thitherward unprecedented. In the mine referred to, in which he is the largest owner, they are going through a ledge, already found to be 12 feet wide, which average assays are \$70 per ton. Mr. Kilpatrick, formerly connected with the foundry of Virginia City, is a gentleman of intelligence and plenty of pluck, and well deserves a handsome remuneration for his large outlay of money in prospecting there. Colonel A. C. Ellis was formerly interested in one of the mines there, but a short time ago sold his interest to Mr. Kilpatrick for \$1000.

MECHANICAL PROGRESS.

Does Vibration Affect the Balance of Machines?

A machine is said to be in balance when it moves harmoniously and without visible vibration; but this occurs only at certain speeds. That is to say, a machine balanced for one velocity will be out of balance at others. The cause of this is obscure, aside from centrifugal disturbance, and many good observers confess their inability to discover it.

The relative velocities of moving parts of a machine remain the same at all speeds, but the relative vibrations do not. At certain velocities the connecting rod of a steam engine transmits the power without vibration or jar; but urged faster it trembles visibly.

These vibrations do not occur in equal times, but are greater or less according as the rod is approaching or leaving the center, and when it is pushing the load or pulling it. Circumstances also affect the vibration. This want of synchronism affects the balance, in that it transfers the jar of the vibration to the moving parts in unequal times. Vibration is not a force, but is an action caused by it, and is undoubtedly a disturbance to harmonious motion.

Again, it is an oft stated point that a reciprocating mass can not be balanced by a rotating mass. If this be true, what becomes of the notorious fact that engines of all kinds move in equal times, as far as we can see? They do not show any want of balance, though cast loose from fastenings, and held down only by their weight. An engine out of balance should give evidence of it by horizontal motion (supposing it to be a horizontal engine) of the head plate on its supports. Engines, when run at certain velocities, under such circumstances, sway the bed plates to and fro; but at higher speeds remain stationary. What has counteracted this tendency when they remain motionless? Has not vibration entered into the question, and by its infinitesimal swaying of masses—like the beats of a pendulum—acted as a balance?

Our argument is for and against; we do not know what causes the disturbances and erratic action mentioned, but it would seem that the vibration of masses of metal at certain velocities may affect the balance of machines in a marked degree. We do not allude to mere tremor, but to visible movements. Even the former may have its influence when large masses are disturbed.—*Mechanical News.*

COVERING WIRE WITH OTHER METAL.—J. Zeugler, of Ansonia, Conn., has patented a machine for covering wire with metal. The machine is designed to cover that class of wire which is first enveloped by an insulating material, after which metal strips are rolled down around it. Four rolls working at right angles to each other are employed for applying the metal strips, and the object of the invention is to so construct the rolls that their working faces may be interchangeable, to present any desirable shape or size. To this effect the working face of each roll is constructed in four segments, grooved around their periphery and fitted to the body of the rolls by suitable clamping plates. Whatever style of wire is required, that particular style of segments is introduced into the machine. When the work with one set of segments has been performed, another set may be introduced without materially deranging the machine. In this way the number of machines necessary for this kind of work in a shop is claimed to be much reduced, thus reducing correspondingly the cost of manufacture.

SECOND-HAND SHAFTING.—The man who buys second-hand shafting to run in his mill is a fool. The man who sells it to him and tells him that it is "just as good as new," is a knave. If the man also buys a second-hand boiler, he is both a knave and a fool, and will buy second-hand machinery as well. When a saw-mill or factory gets cleaned out by fire, the owner will generally build again if he can get as soft a thing with the insurance folks as he had with the old mill. He will look longingly at the old twisted shafting, and ask the machine shop man if it can be "straightened." The machine man lies unblushingly, and says "he can fix it as good as new." It is sent to his shops, and comes back with a bill long enough to buy half enough of new shafting. When started that shafting runs just as it has a mind to. It is shaky, and will always be so. Every time the owner thinks of his "good as new" shafting he groans inwardly and wishes he had bought new shafting.—*Wood Worker.*

THE REPUTATION OF AMERICAN MACHINERY has not only been sustained in recent years, but has been extended to remote parts of the world. The Philadelphia Press says that a prospector sent out some months ago by the Russian Government with the object of gaining information relative to mines and mining, to be made available in the working of the mines of Siberia, has, after visiting many mining districts in this country and Europe, advised his Government to purchase American machinery and to adopt a very large number of the improvements in which, he says, American miners excel. The machinery purchased will be shipped from San Francisco to the mouth of the Amoor river, from whence it will be transported an average distance of 2000 miles into the interior of Siberia.

THE RYE-STRAW CAR WHEEL.—This paper wheel may be larger than the ordinary iron wheel or it may be the same size. Its perpendicular surface, however, is always studded with holt heads. Its surface is never corrugated nor irregular like that of the iron wheel. The paper of a paper car wheel is nothing more nor less than ordinary brown straw board. That made wholly of rye straw is preferable. The boards are cut into disks, and holes in the center are punched large enough to fit the iron axle shoulder that constitutes the hub of the wheel. Thus shaped, the straw boards are placed one upon another with ordinary flour paste, till a pile of them about five inches high is attained. They are then put under a hydraulic press and squeezed together as tightly as it is practicable to compress matter of the consistency of straw board. The pressure is so great as to generate many degrees of heat in the compressed board. After being thoroughly dried, the paper wheel is turned on a lathe to fit the heavy steel tire and shell into which it is inserted to form the core of the wheel. It is held firmly in its position by an iron plate the size of the inner surface of the wheel, and likewise by bolts. And in short, the paper of a paper car wheel is simply a core or filling in a shell of steel, the outer rim or tire that runs on the track being nearly two inches thick. The virtue of the paper consists in the fact that it gives elasticity to the wheel. The durability of the paper wheel, on account of this elasticity, is computed to be many thousands of miles greater than that of the ordinary iron wheel.

DEADENING THE SOUND OF CIRCULAR SAWS. The circular saw frame should be fixed on a brick or stone bed, and the shaft or hearing kept clear of the wall, so that the sound is not carried by contact into the wall. If the wall is not built we recommend a hollow wall with iron ties, and the space filled with sawdust, no opening of any kind being made. If the wall is built, and of single brick, line it with another single brick wall, inserting sawdust between, or a layer of hair felt. If the wall is of wood quartering, lath and plaster it on both sides, and fill in between with sawdust, or coat over the studding with hair felt, and lath and plaster over the face of it. In fixing the quartering, if attached to wood at the top or bottom, bed the attaching points or parts in hair felt. Sound will travel with air, therefore exclude all connection of air. Sound will travel through glass, wood or stone, except it be of great thickness, therefore intercept it by sawdust or hair felt, which are non-conductors. If you have a circular saw on one side of the wall, and you want a point of silence on the other, you must stop all direct communication and cause the sound-laden air to travel in long and circuitous routes, and give out its vibrations before it reaches that point.—*Ec.*

HAND SAWS.—Stiff blades are made of better material than thick ones, and are less liable to "buckle" or "twist," and are not so apt to break. They require less set, will stand an edge longer, and are not so tiresome to work. They should be hung in plain beech handles with rivets flush or countersunk. The blade should be of dark color and have a clear, bell-like ring when struck with the hall of the finger. Blades of a light, iron-gray color are not so good. Never take a saw that jars or trembles in the handle. The first point is to grasp it by the handle and see that it hangs right and that the handle fits the hand properly. Then try the blade by springing it and see that it bends regular and even from point to butt. See that it has a good crowning breast. Hold it at a distance and get a proper light to strike on the blade and you will see if there is any imperfection in grinding and hammering.

ADJUSTING THE TENSION OF SAWS.—In the present state of art, one way of adjusting the tension of circular saws so that they will run true in operation in a true plane, and not buckle, is by hammering the saw between the center and the periphery until it becomes loose. This process of hammering requires very skillful treatment in order to relieve the tension in a uniform manner. But no matter how skillfully it is done, it is injurious to the saw, as the material is thereby made coarse. Mr. William H. Presser, of East Saginaw, Mich., has invented a process which gives a superior result, does away with the necessity of skilled labor, and which can effectually be applied in less time. This process consists in stretching the saw by a certain application of heat instead of by mechanical force. The process is said to be in use by the Michigan Saw Company with satisfactory results.

IRON VS. STEEL FOR RAILROAD AXLES.—A special committee on railroad axles has reported that iron axles are safer than steel axles; that all cranks should have the webs hooped; that as iron cranks appear to fail after running 200,000 miles and steel after 170,000 miles, it is highly desirable that they should be taken off and never again used on passenger engines, and that crank axles properly constructed are as strong as straight axles.

THE CHEAPEST MACHINERY to buy is the best. It will wear longer, require less repairs, and will give better satisfaction than though cheaper in price because inferior in workmanship.

A **FORGE HAMMER** has been invented in England which is driven by gas instead of steam.

SCIENTIFIC PROGRESS.

Friction.

M. Hirn communicates to the *Académie des Sciences* some observations on friction, with particular reference to machines and motors. He has arrived at the conclusion that there is a great difference between the friction of two surfaces sliding upon the other, according as they are dry or separated by a layer of lubricating material. In the case of those surfaces which are dry, the co-efficient of friction is independent of velocities, areas or load. It is otherwise with the other order of sliding bodies, in which, as is generally the case, the surfaces are separated by an unctuous layer. Here the co-efficient of friction is always a function of the velocity, the load and the extent of the sliding surfaces. It is difficult to arrive at exact laws which regulate the phenomena. The quantity of lubricant drawn under the rubbing surfaces, the movement, the temperature of the lubricant, etc., are capable of modifying the value of the co-efficient of friction many times in the course of a single experiment.

It may be broadly stated that, in the general condition of the ordinary machines, the power necessary to overcome friction is proportional to the square roots of the sliding surfaces and of the load and (when the lubricant is abundant) to the velocity. The influence of velocity is above all complex. With great velocities, or at least when the loads are light in comparison with the frictional surfaces, a great number of liquids, very different from oil or fats, become lubricants. Air, under certain conditions, when brought in sufficient quantity between the sliding surfaces, becomes the best of lubricants; the co-efficient of friction being thereby reduced to one ten-thousandth. When on the contrary, the speed is too low or the load too heavy, the unctuous matter may be expelled and the friction become as when dry with a co-efficient rising to one one-hundredth or one-fifth.

Lateral Movements of the Earth's Crust.

While observations are being made for the purpose of investigating "variations of latitude," it is not desirable that the United States Coast and Geodetic Survey should make simultaneous observations with a view to discover, if possible, whether or not places along our coasts are suffering changes of latitude or longitude, or both, due to lateral movements of the earth's crust? If it is true that during geological history large lateral movements of the earth's crust have taken place, and if such changes are still going on, it would seem inevitable that, in regions where lateral displacement is taking place, landmarks should suffer a change of latitude or longitude, or both, according to the direction of yielding to lateral pressure, and that places located upon regions suffering compression or folding should be moved, to some extent, toward places in adjoining regions toward which the movements take place, but which are not themselves undergoing displacements. Since vertical movements of the earth's crust are taking place at measurable rates, and since, in the past, lateral movements appear to have exceeded the vertical, it might be expected that lateral movements are now taking place at measurable rates. Of course, if the superficial strata are not involved in these movements, the deeper strata only yielding, surface landmarks could not reveal the movement; but in this case, and in case folds of the superficial strata along our coasts are in process of evolution, it would seem that such changes might be discovered by sinking deep vertical shafts at intervals along lines normal to the coast. These carefully surveyed at intervals during one or two centuries, it would seem, should show a measurable warping or tilting if such movements are going on.—*Science.*

PROGRESS IN ASTRONOMY.—When the old astronomers mistook the earth for the center of the solar system, or that of the universe, what were the results of their calculations? When the sun and earth were put in their right places by Copernicus, how astronomy progressed in the right direction, and what splendid advances were made by Sir Isaac Newton and Sir William Herschel! The elements of our solar system were not only determined, but with the telescope they peered into the invisible heavens, unfolding telescopic stars, and nebulae composing and decomposing in the formation of stars. With the spectroscopic they have not only given the elementary composition of our sun, but that of the stars and nebulae, with their speed of motion in approaching and receding from our system in their orbital motions. Such have been the achievements in the strides of science in the microcosm of the universe. What sublimity there is in the conception of all this!

WHAT IS MIND?—Go into the chemical laboratory of your own university and touch the two poles of a galvanic battery. What is it that thrills through your bodies, and perhaps even burns the skin of your fingers; or, if the currents be strong enough, strikes you dead on the instant? Galvanism. What is galvanism? A force. Yes, and so is light a force, and heat, and gravitation. But when I am told this, I am just as far from knowing what any one of the forces is as I was before. All that you

could do, if I persisted in asking for fuller explanation, would be to tell me something of the origin and properties of the force in question, and in this way I should obtain some idea of its characteristics, and should be in no danger of mistaking it for any other force. That is what your professor of physics does for you, and if you have only profited by the instruction you have received, you have a store of facts at your command that will enable you to recognize heat, light, electricity, gravitation, magnetism, whenever you see them manifested. When, therefore, you ask me what mind is, I answer that it is a force possessing peculiar properties, and developed by a substance constituting a part of the nervous organism of man and other animals, and known to antagonists and physiologists as gray nerve tissue. This is similar in all essential respects, so far as its terms are concerned, to the definition that you would give me of any other force. Of course it can be made more precise and extensive, but no enlargement would change its character.—*Dr. Hammond at Lehigh University.*

A CURIOUS EXPERIMENT.—Dr. Gross, a German physicist, has made a curious experiment which is not easily explicable by known facts. He placed two electrodes of iron in a vessel of chloride of iron solution, and inserted a galvanometer in circuit, adjusting the current by the Poggendorf Du Bois Raymond method. One of the iron electrodes was then surrounded by a magnetizing spiral through which a current was passed, and it was found that the galvanometer indicated a new current flowing from the electrode that was magnetized through the liquid to the electrode that was unmagnetized. The magnetized electrode was kept cool by circulation of cold water, and Dr. Gross does not think that the effect was thermo electric. When the electrodes were placed in the plane of the axis of the vessel (in this case a tube) with their ends pointing to each other, the current was observed to flow through the cell from the non-magnetic to the magnetized electrode.

AN OPTICAL EXPERIMENT.—A contributor to *Cosmos* suggests a curious optical experiment which may serve to show the principle of the stereoscope. If we cut out of black paper two similar figures—two crosses, for example—and place them, their extremities almost touching, at about three inches from the eyes, before a sheet of white paper, we shall see three crosses, the middle one being dark and completely separate. This phenomenon is explained by the simultaneous vision of the two eyes, and it is easy to show this by looking at the objects successively with one eye. The experiment becomes still more interesting when, instead of black figures, we employ complementary colors—red and green for example. In this case we must use a dark background, and there will appear a white cross in the middle.

A MINIATURE VOLCANO was recently formed spontaneously at the Macquarie Furnace, in Lehigh county, Pa., on the top of a car of melted iron cinder. As the extreme crust of the slag cooled, and, consequently, contracted, the interior gases, cramped for want of room, burst out at the surface in jets and spurts, as in a natural volcanic eruption, and proportionally quite as high, gradually forming a frustum of an irregular cone, with an opening in the center from bottom to top. Through this opening the melted matter was forced up from the mass below, running over from the top of the cone on all sides, and, dripping downward, cooled into beautiful stalactical forms.

THE RAINFALL NOT DECREASING.—The common impression that the rainfall is steadily decreasing is utterly disproved by the record. The average in the city for the whole 48 years ending with 1883, as reported by the Government Signal Office, was 45.36 inches, and the rainfall of 1884 was 55.34 inches, being 10 inches above the average for the previous 48 years, and 13.38 inches above the average for the 16 years beginning with 1836. In fact, 1884 gave us the heaviest fall of rain we have had for 15 years.

A GLACIAL CURRENT.—The glacial Labrador current is annually protruding farther and farther south, crowding the Gulf stream out of its wonted spring course. So great is the southward sweep of the heavy glacial current that when the buoy attached to the broken end of the Atlantic cable of 1865 got adrift it was found to have traveled nearly due south a distance of 600 miles in 76 days in opposition to the Gulf stream.

FOSSIL INSECTS.—In 1879 only 103 fossil insects from the carboniferous rocks of the whole world were known, but during the last five years a great number have been discovered, including 1400 from Commeny, France, a few from Saarbrück, Kleinopitz, Lugau and other Continental European mines, and a very considerable number from the mines in this country.

ARTIFICIAL SPONGE, made of cotton, rendered absorbent and treated with antiseptics, is a recent English product. A piece of the size of a walnut has absorbed water until it has become as large as a coconut. It is so cheap that it need not be used a second time.

ALTHOUGH a variety of microscopic forms of plants have been found on banknotes and coins in circulation, none known to be dangerous to human life have yet been discovered.

TABLE OF CONTENTS.

EDITORIALS.—Granizita Furnaces; The New River Region; Flue and Chamber Dust, 177. Passing Events; Mining Ditches; Ammonia; New Amalgamating Pan; Practical Hydraulics; The Mechanics' Fair; Admission Day, 180. Bulling Construction; New Dry Washer for Placers, 181.

ILLUSTRATIONS.—Granizita Furnaces for Quick-silver Ores, 177. Beam or Girder of Combined Concrete and Iron; The Dry Washer, 181.

CORRESPONDENCE.—Why Mines do not Sell; Nogales, 178.

MECHANICAL PROGRESS.—Does Vibration Affect the Balance of Machines; Covering Wire with Other Metal; Second-Hand Shafting; The Reputation of American Machinery; The Eye-Stave Car Wheel; Deadening the Sound of Circular Saws; Hand Saws; Adjusting the Tension of Saws; Iron vs. Steel for Railroad Axles, 179.

SCIENTIFIC PROGRESS.—Friction; Lateral Movements of the Earth's Crust; Progress in Astronomy; What is Mind; A Curious Experiment; An Optical Experiment; A Miniature Volcano; The Rainfall not Decreasing; A Gaseous Current; Fo-sil insects, 179.

USEFUL INFORMATION.—Porpoise Skin Leather; A Wonderful Cure; Settlement of Mason Work; Cleaning Clock and Watch Movements; Thin vs. Thick Gauge Band-Saw Bases; A New Tanning Agent; The Redwoods; Substitute for Bristles; For Polishing Old Furniture; The First Cast-Steel Saw; Origin of the Saw, 183.

GOOD HEALTH.—Rubbing Swellings and Bruises; Healing Properties of Water; Nephritis; Consumption in Chickens; Leeches; Refreshing Drinks for Invalids; A Curious Fact; Shingles; Eighty and Over, 183.

MISCELLANEOUS.—Silver; Soda from Owens Lake, 178. Practical Hydraulics, 182. The Manufacture of Alkalies, 183.

MINING SUMMARY.—From the various counties of California, Nevada, Arizona, Montana, New Mexico, Oregon, and Utah, 184-85.

MINING STOCK MARKET.—Sales at the San Francisco Stock Board, Notices of Meetings, Assessments, Dividends, and Bullion Shipments, 183.

Passing Events.

The holiday celebrated on Wednesday, in honor of the anniversary of California's birth as a State, was duly celebrated by the Pioneers and the Native Sons, and business was generally suspended.

Both the State Fair and the Mechanics' Fair are now in full progress and well attended. Were it not for these annual fairs, we would hardly be in a position to recognize our material advancement in industrial progress; but they place before us, in a practical way, the results of the labor of our artisans and agriculturists, so that we may see how fast we are growing.

There is little new to report concerning mining matters aside from the current news in our summary. The Pine Creek mines, in Oregon, continue to attract considerable attention, and a good many have gone there.

A COAST SURVEY has left, under the direction of James Lawson, to work northward to meet another party under E. F. Dickens, which goes southward from Salinas.

THE Prussian authorities prohibited the use of cast-iron pillars in building, and the Munich professors immediately demonstrated that cast iron was safer than wrought.

WASHINGTON TERRITORY claims to have an active volcano in the mountains of Kititas county.

Mining Ditches.

The system of artificial water channels, made necessary by the requirements of hydraulic mining, and serving also to supply placer mines not worked by the hydraulic process, as well as quartz mills and other works, has become of vast extent and importance. There are now over 10,000 miles of ditch lines in the United States, which, with their flumes, pipes, reservoirs, etc., represent an investment of \$27,000,000, exclusive of the purchase of water rights.

The following table, compiled by the officers of the census shows the extent of plant of mining ditches reported upon in detail in the United States:

State or Territory.	No. of ditch lines.	Total length, including flumes, etc., Miles.	No. of reservoirs.	Length of flumes, Feet.	Length of pipes, Feet.
Total.....	175	3,494½	173	715,921	266,816
Alabama.....	1	1	600
Arizona.....	3	19	1	637	\$5,880
California.....	65	1,707	83	387,218	152,700
Colorado.....	8	583	3	8,424	600
Dakota.....	6	01½	5	145,360	2,000
Georgia.....	8	149½	7	12,490	20,662
Idaho.....	17	396	11	20,457	876
Montana.....	11	160½	9	42,828	1,700
Oregon.....	56	615½	54	89,047	2,400

In the construction of these several lines many novel problems have arisen, demanding the exercise of a high degree of engineering skill. California contains by far the most extensive system of artificial water channels in the United States, including six-tenths of the total length of ditch lines in the whole country. The relative importance of the California ditch lines is, however, inadequately represented by the mere standard of length; their other dimensions, capacity, more costly construction, and economic bearing placing them still higher in rank. Since the beginning of hydraulic mining an immense amount of ditch construction has been carried on. Thousands of miles of now idle and useless ditches were built in camps long since deserted, and in localities where placer mining is still profitably prosecuted there are also many idle ditches which have been supplanted by newer and larger ones at higher grades. In Boise basin, Idaho, it is estimated there are no less than 800 miles of old abandoned ditch, costing \$85,000, and more than double the length of those now in operation. Many such cases exist in California also. Some idea of the magnitude of the water interest in the United States may be gained from the following exhibit:

Total length of ditch lines..... (miles)...	10,788
Total length of ditches proper.....	10,183
Total length of flumes.....	450
Total length of pipes.....	150
Greatest length of miles under one ownership.....	200
Average length of ditch lines reported, including feeders, etc.....	26
Average length of all California lines.....	12½
Maximum capacity of ditch lines (gallons per 24 hours).....	7,500,000 00
Total cost of plant, including reservoirs, etc., and excluding cost of water rights.....	\$27,056,942 11
Average cost per mile, including reservoirs, etc., of lines reported.....	3,900 60
Average cost per mile, including reservoirs, etc., of all lines.....	2,509 22
Highest cost of plant reported under one ownership.....	2,100,000 00
Nominal capital stock of 13 corporations, exclusive of mining companies, owning ditches.....	\$8,805,000 00
Working capital of 27 lines.....	1,451,300 00
Total annual expense of maintenance.....	\$27,280 41
Annual cost of repairs.....	200,288 66
Annual cost of attendance, exclusive of repairs.....	626,991 75
Average length of season of lines reported (days).....	211

There are other particulars concerning the mining ditches in this State, which are not included in the census returns, and these are shown in the following table:

Name.	Length.	Capacity.	Cost.
Miles.	Inches.	Dollars.	
Total.....	498½	21,500	\$3,609,912
North Bloomfield, including reservoirs.....	157	3,200	708,544
Milton, including reservoirs.....	80	3,000	391,579
Eureka lake and Yuba.....	103	5,800	723,342
Smartsville ditches.....	5,000	1,000,000
Hendricks.....	46½	136,150
La Grange.....	20	2,700	500,000
Blue Tent.....	32	1,800	150,000

Ammonia.

Among the by-products of the San Francisco Gaslight Company, one of the most important is ammonia in its various forms. For household and washing purposes large quantities are made. The company has just put in improved appliances for the manufacture of this product, although they are not yet in working order. Their object is to produce the best article on an economical basis, and offer it to the public at a figure which will make it an object to use

no inferior article. The ammonia made by the company is of a standard strength, regularly maintained. Of course if water is added, the strength is reduced and the substance thus diluted can be sold for less money; but there is no economy in this. While the inferior article sold is not an imitation, of course it is of such a weak nature that twice the quantity will have to be used to accomplish the object the purer article would.

The washing ammonia put up by the S. F. Gaslight Co., is sold in bottles ready for use, with directions as to quantity, etc. They have no object in furnishing it below the standard grade, and have taken out a trade mark, which is shown in our advertising columns, to protect consumers from buying an inferior article of less strength and of less economy.

New Amalgamating Pan.

Mr. M. P. Boss, the well-known millman, has patented through the MINING AND SCIENTIFIC PRESS Patent Agency an improvement in amalgamating pans, consisting of a steam chamber or space for the base and cone of the pan, and a peculiar bottom. The object is to provide the greatest possible heating surface.

In order to provide a steam chamber or space of as great an extent as possible to obtain a large heating surface, Mr. Boss has a plate-piece or casting, formed with an annular plane surface, a cone center and a tubular extension. This is fitted to the under side of the pan, its cone extending upwardly within the cone of the pan, and its tubular extension projecting through and beyond said cone into the head and forming the bearing for the shaft. A space is left between the plate-piece described, and the bottom and cone of the pan, forming the steam chamber, a packing being placed in an annular rib under the pan, and a rust or other steam-tight joint being formed between the top of the cone and the base of its tubular extension.

This lower plate-piece is tightened to its seat by screws. Steam ports communicate with the space between it and the bottom and cone of the pan. It will thus be seen that both the bottom and cone of the pan are adapted to be heated and that its construction is simple, practical and enduring.

Of course Mr. Boss is aware that steam chambers have been heretofore provided for the bottom of a pan and also for a cone, separately, but his idea is a continuous steam chamber in a single pan for both bottom and cone.

In addition to forming the seat for the packing ring, the rib or connection with an inner and concentric rib and the bottom of the pan, serve another purpose. When the shoe and dies are not fitted accurately in the same vertical plane, it is not unusual for the edges of the former to be worn into a point and those in the latter to be beveled or rounded down. This brings the shoes into contact with the bottom of the pan, which, being of much softer iron, wears through, but by having these ribs at this point of wear the pan cannot be worn through.

Practical Hydraulics.

In this number appears the first of a series of articles on "Practical Hydraulics," written specially for the MINING AND SCIENTIFIC PRESS, by P. M. Randall, author of "The Quartz Operator's Handbook," and a recognized authority on this and kindred topics. The articles will be found useful to both engineer and miner. For the engineer the necessary formulae are given, and for those not skilled in mathematics tables will be provided with the necessary explanations for their use, so that no calculation need be made.

It is the object of this series of articles to give in the simplest form such information concerning hydraulics as is needed in every day work in mining and irrigation enterprises. The measurement of water, its flow through pipes, ditches and flumes, the various conditions under which it is used, etc., will be treated. Mr. Randall is thoroughly versed in the details of the subject and can handle it in a satisfactory manner.

The conditions under which we use water on this coast are different from what they are in most other parts of the world. We have high heads and large quantities. We carry water very long distances, and our storage reservoirs are of great extent. The problems of proper management in the purchase and sale are in some respects peculiar. Of all these things Mr.

Randall will write more or less, and we feel certain that the series will be of great interest and practical value.

The Mechanics' Fair.

No one who walks among the exhibits at the Mechanics' Fair can fail to be impressed with the varied forms which illustrate the industrial interests of this State. It is a revelation to many people to see what a number of things are manufactured in our midst, and how excellent are the products. The first thing that strikes the observer on entering is the elegance and variety of the carriages in the displays, all showing fine workmanship and finish and beauty of design. Then the agricultural implements claim attention, showing as they do not only great inventive faculty but skill in construction. Scattered about are numerous smaller articles of household and industrial uses, each of which has an important place in modern and civilized life.

In the machinery department are pumps, steam engines, machine tools, printing presses, electrical apparatus, and all sorts of mechanical appliances. The mining machinery exhibit, is, however, small. Probably the exhibit which shows our industrial advancement most is that of the Pacific Rolling Mills, where are shown steel castings, forgings, bolts, iron in various forms, a large crank shaft, and a miscellaneous collection of the products of the mills. The collection of native woods is varied and excellent. On the other side of the Pavilion are the natural products of different counties of the State in great profusion, and many miscellaneous exhibits.

Up stairs the art gallery claims attention, with its collection of paintings, drawings, etc. And the other galleries contain the great organ, pianos, furniture, lounges, bric-a-brac, stained glass and a profusion of articles too numerous to mention.

The attendance at the fair continues large. People who seldom at other times give a thought to industrial matters are here shown what our mechanics and artisans are doing. California manufactures are rapidly extending their scope in many directions with the result of maintaining among us a class of settled population which is of the greatest benefit to the State. It behooves us, then, to encourage these men, and to purchase, wherever practicable, the articles which are made in our own communities. The fair is doing a good work in bringing before the public such articles as are made here, and showing what strides we are making in industrial advancement.

Admission Day.

The anniversary of the admission of California into the Union, was appropriately celebrated by the California Pioneers in this city, and by the Native Sons of the Golden West at Santa Rosa, on Wednesday last. The celebration at Santa Rosa was particularly brilliant. There was a reception, procession, literary exercises, an address by the Governor of the State, and in the evening there was a grand ball.

The anniversary of the admission of California into the Union, celebrated this week, brings to the mind of all old Californians the stirring times of early days, when they were laying the foundation of the "Empire of the Pacific." Few who were not here in the "days of 49" can appreciate the struggles and hardships of the pioneers of our noble State. Still these hardships are now forgotten, and those who experienced them remember only the excitement of those "days of gold," when everybody was getting rich, and when every day brought forth events which are now of historical interest.

The history of the discovery of gold in California is well known. Before that discovery California was merely a vast cattle range and in a state of semi-civilization. Its population was scant, and made up mostly of Mexicans and Indians, the few scattered missions established by the Catholic priests being the only settlements of note. San Francisco, known then as Yerba Buena, Monterey and San Diego, were the seaports, where a few hide-droghers occasionally called. The population was mainly near the coast, the interior being occupied by wandering tribes of Indians.

Space forbids our indulging in even a brief retrospect of the doings of these early days. The rush of thousands of adventurers to the

golden shores of California immediately succeeded the announcement of the discovery of gold, and before long the sleepy shores teemed with busy, excited men, and the building of a State was begun.

The anniversary of the day California became a State is now a legal holiday. Banks and places of business are closed and recreation is indulged in, while the California Pioneers and the Native Sons, by appropriate ceremonies, keep alive the remembrance of the day.

Building Construction.

Construction of Iron and Concrete.

Some tests were made last week, at the iron works of McTormick Bros., on Beale street, near Folsom, with an improved form of girder for building purposes, introduced in this city by P. H. Jackson. A number of prominent architects, builders and engineers were present at the trial, and watched the progress of the gradual bending and final breaking of the beam, the object being to see what load it would carry.

This improvement in building construction is in making the part to be supported aid in its own support, instead of the ordinary application requiring the use of supporting iron beams or girders of ample strength to sustain the entire structure. This new construction is the patented invention of Mr. Thaddous Hyatt, who found that iron or steel bars with a roughened or holding surface may be combined with hydraulic cement or concrete as tie metal, capable of furnishing all the tensile strength needed to balance the compressive force of the other materials, when the structure is subjected to a bending stress.

In the ordinary application for the support of a structure, as a wall of a building, or a sidewalk with the vault beneath, iron beams and girders are used, and are required to be of sufficient strength to support the entire load: but by the discovery of Mr. Hyatt, after years of study and by many experiments, it was found that all the metal of supporting beams may be dispensed with save the tie only; also, that baked bricks and concrete possess in themselves cohesive power and strength sufficient to perform the functions ordinarily performed by a metallic web. Therefore, all structures made of brick, stone, concrete, artificial stone and the like, may aid in their own support so far as resisting the one force of compression when united with a base of hydraulic cement or concrete combined with iron or steel ties, which will resist the other force-tension. The resisting of these two forces is all that is required in a beam or girder in sustaining a load. These ties may be of any shape. Steel or iron bars or rods, and may be used singly, several in the cement or concrete body and disconnected, or may be connected together in a gridiron form, with their surfaces roughened, corrugated, serrated, or other than the regular smooth surface common to metal bar or rods, or may have pins or cross ties in the manner of a gridiron. Mr. Hyatt found that when the structure was subjected to a severe bending stress smooth bars pulled through, even when the ends were fastened,

For a row-stress girder a tie may be made to depend on the two end fastenings only, but a beam proper must be qualified to resist cross strains at any part, and equally well. The tie must of necessity be attached to the web practically throughout its entire length, and as firmly at one point as at another. The application of this invention may be in two ways: one as a separate beam or girder made of sufficient strength to sustain the entire structure as that of any other beam or girder which will have to resist both compressive force and tensile strain. The other is in forming at the base of a wall to be erected, or other like material structure to be supported, having the property of adhering to hydraulic cement or concrete, a sufficient quantity of iron or steel ties to resist tensile strain embedded in the bottom of a body of hydraulic cement or concrete, as a holding power to the ties; and the top of the cement or concrete body which surrounds and holds the ties unites with the brick or stone that forms the wall or other structure to be built on its top. The whole wall or structure, when the cement or mortar holding the bricks or stone has become hard, is united with the hydraulic cement or concrete holding the ties at its base, and from the ties at the bottom to the top of the wall, bears that relation for strength as the depth of a beam or girder, the upper part of the wall above the neutral axis resisting compression, and the ties at the bottom resisting tension, as in that of the bottom flange of a wrought-iron girder.

In case of an artificial stone sidewalk a floor or roof of a building resting on arches of the same material, the sidewalk and arch being in one piece, and in place of the usual iron supporting beams, these metallic ties are built in near the bottom of the arches and take the

place of the bottom flange of the ordinary beam, the ties resisting the tensile strain, and the upper part of the arch and sidewalk above the neutral axis resisting the compressive force and so far aiding in one-half of its own support.

With the former the combination is a concrete beam combined with iron or steel ties and is required to sustain the entire wood upon it. Portland cement, sand and gravel has a great resistance to crushing but is comparatively very weak in resisting separation or tension. In General Gilmore's Work on Coignet-Beton and Other Artificial Stones, mention is made of his experiments in which he found that of a mixture of 1 volume of Portland Cement to 2 volumes of sand, the ratio of the compressive to the tensile strength varied from 14 to 1 to 19 to 1. With 1 cement and sand 4 it reaches high as 25 to 1 and 29 to 1. With cement 1 and sand 5 as high as 35 to 1. Comparing these resistances with that of cast iron the ratio of the compressive to the tensile strength is but 64 to 1.

When a beam is subjected to a bending stress from the load it becomes more or less curved, by virtue of which the lower part is lengthened and the upper part shortened, in proportion to the depth of the beam and the difference in length between the radii of the curves. Were the beam made up of horizontal layers the effect of the stress would be to cause these to slide one upon the other, but the beam being solid the particles are held together by their own cohesion, the wearing stress being thus opposed by the cohesive force. The primary strains in the beam, or the lines of compression or extension being upon the curved lines, the disturbed particles must of necessity tend to arrange themselves in harmony with the radial lines of circles, all below the neutral axis seeking extension, and all above compression.

As a better illustration of these force reference is had to Figure 1, of the engraving, which represents the side view of a beam or structure to be loaded and to be subjected to transverse strain. When loaded the line xy will represent the neutral axis or dividing line between the compressive force above and the tensile strain below it. The greatest forces and strain will be at the extremes from the neutral axis. The imaginary vertical lines ef are at right angles with the bottom and have reference to the loaded beam or structure, Fig. 2. The distance from any two of these lines in Fig. 1, from e to e at the top is the same as from f to f at the bottom; also the length of the beam along the top and bottom are equal. Fig. 2 represents Fig. 1 loaded by the weight L and subjected to a severe bending stress. The vertical lines ef in Fig. 1 have become radial lines in Fig. 2, caused by the load L , radiating from a center to the curve of the bottom of the beam. The distance from f to f at the bottom of the beam in Fig. 2 is greater than in Fig. 1, the tensile strain or thrust force has disturbed the particles below the neutral axis and elongated the beam in that part, the greatest at the bottom surface of the beam, and gradually diminishing up to the neutral axis where the tensile strain ceases, and from the neutral axis the compressive force begins, and gradually increases until the top is reached where it is the greatest. The distances from e

BEAM OR GIRDER OF COMB

to e is shortened, also the length of the beam at the ton.

Mr. Hyatt, knowing that Portland cement concrete will resist a great compressive force without crushing and was comparatively very feeble in resisting separation of the particles, devised a means to prevent the bottom of these imaginary lines at f/f from spreading by building in the material thin iron or steel ties with a holding surface other than the plain bar to prevent the slipping or the sliding of the surrounding material over the ties along the bottom of the beam. This would furnish all the tensile strength needed below the neutral axis to balance the great resisting property of the Portland cement concrete above the neutral axis if the structure was a beam, or if the brick work of the structure was a brick wall.

Mr. P. H. Jackson, who has the sole right for this coast for Mr. Hyatt's patent, had a beam made in order to test the holding together of these imaginary lines, by seven longitudinal ties of flat iron connected together by $\frac{1}{4}$ inch round iron rods at distances equaling that from $\frac{1}{2}$ to $\frac{3}{4}$ Fig. 1 on the principle of a gridiron. With this beam the trial of last week was made. Fig. 3 shows a side view of this beam. Fig. 4 is a cross section. It was seven inches wide across top and bottom.

The neutral axes $x y$ in Fig. 2 is the original length of the beam, providing the two opposite forces are balanced in resistance. If

all these imaginary lines, e, f , are held so as to resist the horizontal thrust along the bottom so as not to widen at f, f , as in Fig. 1, and they are also held so as not to draw together at e, e , on the top, then there can be no bending of the beam when loaded, and it will remain as in Fig. 1, and 14 inches deep. Length, 10 feet, 6 inches. Distance between supports, 9 feet. The beam was made of Portland cement and gravel, and was five months old. Near the bottom of the beam was built in three of $\frac{1}{2} \times 1$ inch and four $\frac{1}{2} \times 1$ inch flat iron ties extending the length of the beam, and at every three inches in length, extending the middle of the beam through these seven longitudinal tie bars, were $\frac{1}{2}$ -inch round cross rods, seven inches long, tying the beam in its width; then $\frac{1}{2}$ inch rods were attachments or cross ties to prevent spreading from f to f , as in Fig. 1. This gridiron construction Mr. Hyatt believes to be better than his single bars, roughened in a holding surface other than the regular surface of a metallic bar, as the gridiron principle ties the beam across and unites them in resisting tensile strain. The weight of these ties and cross rods was but 46½ pounds. The $\frac{1}{2}$ -inch hole in the ties reduced the 1-inch width of iron to $\frac{1}{2}$ inch tensile resisting width, therefore the area of these ties is as follows: 3 of $\frac{1}{2} \times 1 = .563$; 4 of $\frac{1}{2} \times 1 = .375$; total, .938 of an inch, or less than one square inch of iron. Two $\frac{3}{4}$ -inch diameter cast-iron rope moldings were built in near the top, as shown in Fig. 4, to resist compression, and was in excess of what the case required, as the concrete above the neutral axis furnished nearly the resistance required. Cast-iron being harder than wrought-iron to resist compression, as its resistance is 93,000 lbs. per inch, wrought-iron being but 36,000 pounds per inch. The resistance by the cast-iron rods would equal the compressive resistance were there a brick wall on top of the concrete body. The beam was loaded over the length between the supports with pig-iron, and was closely piled up 7 feet 6 inches in height before it broke. It was loaded as follows:

Tons.		Inch.
101,	(20,695 lbs.), deflected.	1-16
153,	(30,380 " " "	3-32
153,	(33,590 " " "	1 8
	(35,703 " " "

Broke, by separation of the tie bearing apart at the holes where the $\frac{1}{4}$ -inch rod passed through and at the center of the length of beam. It is now to be seen in front of No. 231 First street.

The great load required to break this small heam was a matter of surprise to those present in so far of its exceeding that of a wrought iron heam with a bottom flange equaling the area of all these rods which was less than one

BEAM OR GIRDER OF COMBINED CONCRETE AND IRON

square inch. The distance from the center of the ties to the center of the cast-iron bars was 12 inches, as in Fig. 4, therefore, computing it as a wrought-iron beam 12 inches deep we have from the formulae as follows, the breaking distributed height, computing the area of bottom flange at one inch, and depth 12 inches:

$$\frac{1'' \times 12 \times 80 \times 2}{9 \times 12} = 17.8 \text{ gross tons, or } 19.9 \text{ net tons.}$$

Excess of the Hyatt concrete beam over that of a wrought-iron beam is seven tons, or one-third greater. Cannot be from any other cause than its lateral resistance, being a solid instead of a web, also the bottom flange of an iron made up beam has many punched rivet holes weakening the plate. This construction is certainly new to us, and worthy of adoption when the structure to be supported aids in its own support to the extent of one-half. The result of this trial shows this construction from the deflections may be safely employed at one-fourth its breaking load.

THE GOLDEN GATE CONCENTRATOR has recently been tried in the Chicago-Phoenix Mill, in this State, with, it is said, satisfactory results. Its capacity is large, so we are informed, and it does its work well. We are not at present advised as to any details of construction or operation.

New Dry Washer for Placers.

There is on exhibition at the Mechanics' Fair a new form of dry washer called the Hitchcock & Hershey dry placer gold concentrator. This machine is designed to work gold-bearing gravel in places where water, for washing, cannot be obtained, except in very limited quantity, or at great expense. Such districts exist, in large areas, in the southern counties of California, as well as in Arizona and New Mexico, and in the republic of Mexico, where the want of a portable and effective means by which the gold they contain can be rapidly and cheaply separated, is generally recognized.

The machine is quite simple in form, as the engraving shows. It consists of three inclined

Hitchcock & Hersey Dry Washer.

wooden platforms, B, to each of which is imparted a reciprocating motion. The material is fed from an adjustable hopper, A, onto the upper platform. The upper portion of this platform is flat, and the lower end inclined, as shown. The agitation caused by the vibration causes the gold and heavy fine stuff to settle, while the coarse gravel or tailings passes off over the end of the platform. About 70 to 80 per cent of the tailings passes off at the first tray. The gold and finer material, which settles on the bottom of the platform or tray, B, when it gets to the lower end, passes through a slot under a broad steel knife, S, which is adjustable, and which separates the under and upper strata. This under or richer layer then falls through the slot under this knife into a tube or pipe, E, which leads it back to the upper end of the second tray or platform, where it is submitted to a second similar concentration; and again it passes to a third tray through the pipe, F, in a similar manner. At the lower end of the third tray, where the final separation occurs, the valuable material passes through a discharge spout, D, into a suitable receptacle, the tailings passing off at the end on to the dump. The concentrates may be again passed through the machine if desirable. It can be run by hand or horse power.

A ton of gravel having passed the machine once, is reduced to about 75 pounds, or less (varying with its quality), in which it is claimed will be found about 95 per cent of the gold originally held in the total bulk. Coarse and fine gold are saved with equal facility, but it is manifest that what is known as "float" gold, is more liable to escape.

The capacity of one machine requiring two men to work it, will average 20 tons of gravel per day. They can be built of any size and capacity, but it is believed that when horse or other power is to be used, a number of hand machines, set side by side and provided with pulleys, will prove more satisfactory.

Some preparation of the gravel is often required to break lumps, and separate boulders and stones larger than a walnut, but as placer deposits often lie on hills or hillsides, advantage can be taken of that fact to supply gravel to machines through an inclined trough arranged with a suitable "grizzly," or screen, under which a second trough may convey it to the machines and feed it to them almost automatically.

The machine is built so that all parts are interchangeable, and weighs about 325 pounds. It is readily taken apart for packing. Two mules could carry the machine and a camp outfit for prospectors. The trays are made of good hard wood. Very little power is required to drive the machine, and there are no blowers or fans, as most dry washers have. It is claimed that five of these machines run together will wash 100 tons of dust or gravel per day. We saw a test of this machine when six grains of pure gold were placed in about 100 pounds of clean gravel. After it was passed through the machine, the gold obtained was weighed and showed a scant six grains, proving very little loss, if any. The frame of the apparatus is of malleable iron, and is light and strong.

PRACTICAL HYDRAULICS.

NUMBER 1.

PRINCIPLES OF HYDRAULICS.

[Written for MINING AND SCIENTIFIC PRESS by P. M. RANDAL.]
[COPYRIGHTED.]

The term hydraulics was originally applied to water, pipes, or to the conveyance of water through pipes. It is now used in a wider sense to designate that branch of engineering which treats of water in motion, the means of measuring, conveying and raising it, and its application to machinery as a prime motor.

The source of this motion is the force of gravity—a force which acts indiscriminately upon every particle of matter, and impresses upon each particle at every instant the same degree of velocity *in vacuo*. The fundamental principles or laws of hydraulics then, are those of uniformly varied motion.

These, with respect to a body falling from rest through a certain height *in vacuo*, are as follows:

1st—The velocities acquired are proportional to the times elapsed since the beginning of the motion.

2d—The spaces fallen are proportional to the squares of the times elapsed.

3d—These spaces or heights are proportional to the squares of the velocities acquired at the end of each.

4th—The velocity acquired at the end of the first unit of time is equal to twice the distance fallen during this time.

The intensity of the force of gravity varies in different latitudes, but for most purposes in hydraulic calculations, it may be regarded constant.

The velocity which the force of gravity can generate in a second of time at the surface of the earth, is usually designated by g , and is termed *acceleration of gravity*. Its value, as given in Rankin's Applied Mechanics, p. 485, for Lat. 45° at sea-level, is g .

This $g = 32.1695$ feet.

For the most part in practice $g = 32.2$.

In case a high degree of accuracy is required, the oblateness of the earth, the latitude and elevation of the place at which the value of the force of gravity is sought, have to be considered.

The formulas involving these elements (the two former deduced from numerous pendulum experiments made in various parts of the world), are given in Rankin's Applied Mechanics, pp. 485-486, as follows:

$$R = 20,887,540 \text{ feet } (1 + 0.00164 \cos 2l) \quad (2)$$

$$g = g' \left(1 - 0.00284 \cos 2l \right) \left(1 - \frac{2h}{R} \right) \quad (3)$$

In which R denotes the earth's radius at the locality of observation, l the latitude, g' the force of gravity at sea-level, in Lat. 45° , and g the force of gravity at the elevation above sea-level in the given Lat. l . The factor $\left(1 - \frac{2h}{R} \right)$ in the second member of equation (3) is readily obtained from the well-established proposition that the gravity of a body varies inversely as the square of the distance from the center of the earth. If in a given latitude l , g denote the force of gravity at sea-level, and g'' the force of gravity at an elevation, h there will result:

$$g'' = g \left(1 - \frac{2h}{R} \right) \quad (4)$$

When $h = 0$, it is obvious that in equations (3) and (4), the factor $\left(1 - \frac{2h}{R} \right) = 1$.

When $l = 45^\circ$, $\cos 2l = 0$; whence

$$R = 20,887,540 \text{ feet} = 3956 \text{ miles.} \quad (2)$$

Example 1.—What is the value of the force of gravity at Presidio, San Francisco, in latitude 37° , $47'$, $48''$, at sea-level.

Calculation.—Employing formula (3).

Find $\cos 2(37^\circ, 47', 48'') = 0.2488$.

Substitute this value, namely, 0.2488, and the value of $g' = 32.1695$, of equation (1) in equation (3), observing that $h = 0$, $g = 32.1695 (1 - 0.00284 \times 0.2488)$. Whence $g = 32.1468$ ft.—*Answer*.

Ex. 2.—In latitude 37° , $47'$, $48''$, as in Ex. 1, what is the force of gravity at an elevation of 2 miles?

Cal.—We find from (2) and (2),

$$R = 3956 (1 + 0.00164 \times 0.2488).$$

Whence $R = 3957.6$ miles.

Substituting this value of R and the value of g as found from Ex. 1, in equation 4, $g'' = 32.1468 \left(1 - \frac{2 \times 2}{3957.6} \right)$ Reducing $g'' = 32.1144$.—*Ans.*

Ex. 3.—Required the force of gravity at an elevation of two miles above sea-level at the equator.

Cal.—When $l = 0$, find $\cos 2l = 1$. Substituting this value of $2l$ in eqs. (2) and (2), and reducing $R = 3962.5$. Substituting the value of $R = 3962.5$, the

value of $\cos 2l = 1$, the value of $g' = 32.1695$, and the given value of $h = 2$ miles in formula (3).

$$g = 32.1695 \left(1 - 0.00284 \right) \left(1 - \frac{2 \times 2}{3962.5} \right)$$

Whence $g = 32.0457$.—*Ans.*

Remark.—Had we made $R = 4000$ in the preceding examples, it would in no case varied the result to exceed .0003. We may, therefore, without sensible error, regard the radius constant and equal to $R = 4000$.

These refinements, with respect to variations in the force of gravity under different conditions, though highly important in establishing a standard of measurement, and in various scientific investigations, yet for the most part are little applied in practice.

Reverting to the subject of the laws of varied motion, it will be noted that the velocity acquired by a falling body at the end of the first second of time, is double the height which the body has fallen during that time. A body then, *in vacuo*, falls during the first second of time 16.1 feet, or more accurately, 16.085 in lat. 45° .

Denote in seconds, the times of a falling body *in vacuo* by the consecutive numbers—1, 2, 3, 4, 5, 6, 7, 8, 9, etc.

Then, according to the 2d law, the heights of the fall are proportional to the squares of these times; thus—1, 4, 9, 16, 25, 36, 49, 64, 81, etc.; and, according to the 3d law, the heights are proportional to the squares of the velocities acquired during these times.

If the height of fall, as found by law 2d, due any given time, be taken from the height of fall due this time increased by one second, the remainder will be equal to the space fallen during this increment of one second.

Thus the heights, so fallen in the natural order of times, are 1, 3, 5, 7, 9, 11, 13, 15, 17, etc.

Examples and Calculations.

Ex. 4.—How many feet will a body as water fall *in vacuo* during the 5th second of its descent?

Cal.—By the foregoing it will be seen that the fall during the 1st second is 16.1 feet nearly, and during the 5th second is 9 times as much:

$$\text{Hence, } 16.1 \times 9 = 144.9 \text{ feet.} \text{—Ans.}$$

Ex. 5.—What distance will water fall *in vacuo* in 5 seconds?

Cal.—Note in accordance with law 2d, that a body falls 25 times as far in 5 seconds as it does in 1 second; hence, $16.1 \times 25 = 402.5$ feet.—*Ans.*

In further illustration:

Cal.—Note that the heights fallen respectively during each second of the given time of 5 seconds, are 1, 3, 5, 7, 9. The sum of which is 25, as found in the preceding calculation; hence, $16.1 \times 25 = 402.5$ feet.

Ex. 6.—What will be the velocity of water falling, *in vacuo*, at the end of the 5th second?

Cal.—Observe that, according to the 1st law, the velocity is 5 times as great at the end of the 5th second as it was at the end of the first—that is, $2 \times 5 = 10$; hence, $16.1 \times 10 = 161$ feet.

RULES WITH RESPECT TO THE RELATIONS OF SPACE, TIME, VELOCITY, AND THE FORCE OF GRAVITY, INVOLVED IN THE FALL OF A BODY AS WATER IN VACUO.

The velocity given to find the head or distance the water has fallen.

Rule 1.—Divide the square of the given velocity by twice the acceleration of gravity—that is, by 64.4.

Ex. 7.—The velocity is 150 feet per second; what is the head on distance fallen?

$$\text{Cal.}—150 \times 150 \div 64.4 = 349.4 \text{ feet nearly.} \text{—Ans.}$$

To find the head or distance water will fall in a given time

Rule 2.—Multiply the square of the time in seconds by 16.1 feet.

Ex. 8.—What distance will water fall in 4 seconds?

$$\text{Cal.}—4 \times 4 \times 16.1 = 257.6 \text{ feet.} \text{—Ans.}$$

The time given to find the velocity of water falling freely.

Rule 3.—Multiply the time in seconds by the acceleration of gravity—namely, 32.2 feet.

Ex. 9.—What velocity does water acquire in falling 7 seconds?

$$\text{Cal.}—32.2 \times 7 = 225.4 \text{ feet.} \text{—Ans.}$$

The head, or distance of water fallen freely, given to find the acquired velocity.

Rule 4.—Extract the square root of twice the product of the head and the acceleration of gravity; or multiply the square root of the given head by the square root of twice the acceleration of gravity—that is, by 8.025.

Ex. 10.—What velocity will water acquire by falling freely 196 feet? In other words, with what velocity will it flow under a pressure or head of 196 feet?

Cal.—Square root of 196 feet is 14 feet; Then $14 \times 8.025 = 112.35$ feet.—*Ans.*

The velocity being given to find the time which a body, as water, has fallen.

Rule 5.—Divide the given velocity by the acceleration of gravity, viz.: 32.2 feet.

Ex. 11.—The velocity is 322 feet per second; what is the time fallen?

$$\text{Cal.}—322 \div 32.2 = 10. \text{ seconds.} \text{—Ans.}$$

To find the time required for water to fall freely through a given distance.

Rule 6.—Extract the square root of twice the given distance, divided by 32.2; or, in other words, divide the square root of the given distance by the square root of one-half the acceleration of gravity—that is, by 4.012.

Ex. 12.—What time will water require to fall freely a distance of 144 feet?

Cal.—The square root of 144 feet is 12 feet; hence, $12 \div 4.012 = 3$ seconds nearly.—*Ans.*

Determination of these laws of hydraulics by analysis.

To determine these laws let h represent the head or distance in feet, through which the water acts, or has fallen in a given time denoted by t , let v represent the velocity acquired at the bottom of this head or distance fallen, and let g denote the acceleration of gravity—that is, the velocity which the force of gravity can generate in a second of time at the surface of the earth.

Then the expressions for velocity and acceleration of gravity will be:

$$v = \frac{dh}{dt} \quad (5)$$

$$\text{and } g = \frac{dv}{dt} \quad (6)$$

Eliminate dt from (5) and (6):

$$dh = \frac{v dv}{g} \quad (7)$$

$$\text{Integrating (7) } h = \frac{v^2}{2g} \quad (8)$$

$$\text{Integrating (6) } v = gt \quad (9)$$

$$\text{Combining (5) and (9) } dh = g t dt \quad (10)$$

$$\text{Integrating (10) } h = \frac{gt^2}{2} \quad (11)$$

$$\text{Combining (9) and (11) } h = \frac{v^2}{2g} \quad (12)$$

$$\text{Reduced (7) as to } v \quad v = \sqrt{2gh} = \sqrt{2} \times \sqrt{g} \times \sqrt{h} \quad (13)$$

$$\text{Divide (9) by } g \quad t = \frac{v}{g} \quad (14)$$

$$\text{Reduce (11) as to } t \quad t = \sqrt{h \div \frac{g}{2}} \quad (15)$$

By inspection it will be seen that in the text, the given rules and the enunciations termed laws are derived from these formulas, or are but expressions for them; and that the relations of space, time, velocity and force of gravity are more clearly expressed by formula than it was possible to do by words.

To facilitate this inspection, the following references to the different forms of expression, but equivalent in meaning, are given. Thus—

Laws.	Rules.	Formulas.
1st.	3d.	(9) $v = gt$.
2d.	2d.	(11) $h = \frac{gt^2}{2}$.
3d.	1st.	(8) $h = \frac{v^2}{2g}$.
4th.	—	Modification of (12) $v = 2h \div 1$ See.
	4th.	(13) reduced from (8") $v = \sqrt{2gh}$.
	5th.	(14) reduced from (9) $t = \frac{v}{g}$.
	6th.	(15) reduced from (11) $t = \sqrt{\frac{2h}{g}}$.

The value of g being substituted in these formulas, every possible question with respect to the free fall of water or other body can be answered.

The formula of most frequent occurrence in hydraulics corresponds to the 3d law, 1st rule, and is denoted in the column of formulas above by (8)—that is, $h = \frac{v^2}{2g}$. This formula, reduced with respect to v , is denoted by (13); $v = \sqrt{2gh} = \sqrt{2g} \times \sqrt{h} = 8.025 \sqrt{h}$, in which forms, it frequently occurs in works in engineering. In this, or these formulas, v is termed the velocity due to a given height, h , and h the height due to a given velocity, v —that is, v denotes the distance which water flowing freely under a pressure of h feet in height, will pass over in one second of time at the bottom of this height, h , which velocity is the same, as water falling freely through the height, h , would acquire at its bottom.

The Manufacture of Alkalies.

It is gratifying to find that the producers of alkalies have seen it to their advantage to utilize the products that at one time were allowed to escape to the great injury of all kinds of vegetation. From the report of the Chief Inspector under the Alkalies Act for East Lancashire and Yorkshire, it appears that last year there were 155 works under his inspection, including 15 connected with alkali and copper, 40 with nitric acid, and 36 with gas liquor and sulphate of ammonia. We are told by the inspector that with respect to nitric acid there is still a nuisance arising from it, not, however, from its direct manufacture, but from its use in subsequent operations. However, throughout the West Riding of Yorkshire, where considerable quantities of nitric of iron are produced for dyeing, it was found that the recovery of the lower oxides of nitrogen, as a mixture of nitrous and nitric acids was never attempted, but were sent to the chimneys and allowed to escape. It is almost needless to say that these have done a great deal of harm to both animal and vegetable life. However, the inspector states that during the last year or two the efforts made to induce manufacturers to study their own interest as well as the public benefit, by erecting oxidizing condensers, have been so far successful, that whilst at the beginning of 1882 there were only 16 condensers in the district there are now 40, of which 18 have been erected or enlarged in 1884. The saving effected by this means is from 20 to 35 per cent of the nitric acid formerly used to obtain the same result. Consequently, not only have the manufacturers been greatly benefited, but those living near the works as well. Ammonia is now extensively used in the production of various kinds of sodas, bleaching powder, etc., and is obtained in considerable quantities from gas water. It is also used to make alum, the vapors of the boiling liquid being forced through a mixture of aluminous earth, and hydric sulphate gives ammonia alone. From the same water there are also other salts, such as ammoniate carbonate, the sulphide, and the sulphocyanide. Where the sulphate of ammonia is made from the gas liquor the fixed ammonia only is liberated by the lime; the method does not appear to have been successful, owing to the amount of acidity evolved, and of this manufacturers were informed and warned to alter their system if the gases were being burnt. Where liquid ammonia is principally made from the crude liquor, very little sulphuretted hydrogen is evolved, which is allowed to be draughted to the boilers or still fires. In another direction the report of the inspector is also satisfactory, for it states that the quantity of sulphur burnt in the same chamber space in many cases has been diminished, so giving a more regular low exit test, while in other cases there has been a decided increase of the sulphur burnt, but not of such an amount that the chamber space has been insufficient for the work. In the vitriol works proper, as well as at many of the alkali works, we are told that a considerable proportion of the acid made is rectified for sale, while there has been a decrease in the productive power as regards mineral phosphates. The small manufacturers find it to their advantage to purchase superphosphate from the large makers and make their own mixtures from it, instead of dissolving for themselves, so avoiding the cost and trouble of dealing with the gases evolved. The inspector further states that in those works where mineral phosphates are used a fair amount of efficiency has been attained in dealing with the acid vapors evolved from mixer and den, and in no case are mineral phosphates dealt with unless with the latter condensing arrangements attached. However, at only one establishment, it is stated, has it been found possible to reach the limit of 0.2 gr. SO² acidity per cubic foot of gases escaping to the chimney; but the amount of acidity added to the chimney gases would probably not exceed that figure. The business done at the alkali works during 1884 was far below the productive power, for they par ool of the depression so general throughout the country, and so far during the present year they have continued in the same state. Still, as before stated, it is gratifying to find that manufacturers in their own interest, although at first against their will, have introduced appliances for abating nuisances injurious to health and all kinds of vegetation.—*London Mining Journal.*

RESUMPTION OF THE OLD DOMINION COPPER COMPANY.—The announcement that the Old Dominion Mining Company would resume operations on Monday next was received with much satisfaction by all classes of our citizens, as it is an assurance that the perplexing difficulties which caused the suspension of work have been overcome, and there is now every reason to hope that the mine and smelter will be operated continuously through the winter. Good miners can procure work by calling at the office of the company; men will be hired as fast as their services can be made available, until full shifts are employed. Some development work will necessarily have to be done before the usual production of ore can be counted on, and consequently smelting will not be resumed for two or three weeks.—*Silver Belt.*

USEFUL INFORMATION.

PORPOISE SKIN LEATHER.—Since the large attention that has been devoted to the porpoise fishery on the Atlantic Coast efforts have been made to utilize to their greatest extent the refuse product after the extraction of the oil, which constitutes the chief product of these fish. Among other efforts, the skin is now utilized for the manufacture of leather, and Mr. Baker has recently established a porpoise skin tannery in Philadelphia to meet the demand in this direction. Porpoise leather is a novelty as yet, especially when used in the manufacture of shoes. It has been largely used, however, in making shoe strings, owing to its great strength and pliability. It has a long, tenacious fiber, and as it will not crack nor tear, it makes an excellent leather. When made up into a shoe it greatly resembles French kid. It wears like iron, and would be suitable for boys' shoes. It is said to be entirely waterproof and very cooling to the feet, making it excellent for summer wear. The skins cut from five to six pairs of men's vamps. The leather is hemlock tanned.

A WONDERFUL GUN—IF ALL IS TRUE.—The gun which Mr. Hiram S. Maxim has now on view at the Exhibition of Inventions is probably as near an approach to perpetual motion as has ever been reached. Here is a daily paper's description of this terrible machine: "The ingenuity of the contrivance consists mainly in using the recoil or reacting force that follows a discharge. By that means the empty cartridge is cast out, a fresh one put forth in its place, and the instrument fired. And so the deadly round goes on at the rate of ten shots a second, or 600 per minute. Such is the rapidity that the ear cannot discriminate the individual explosions, the sensation being that of one prolonged sound. And such is the ease of manipulation that the gunner can write his name with bullets on a target at the limit of his vision as quickly as one could make an impression by an Albion printing press."

A SUCCESSFUL ATTEMPT was made last year in Leipzig to remove by chemical means the incrustation that coated the interior of the force main from the pumping station to the reservoir. The main is about 15½ inches wide and 4.55 km. long, and the incrustation was from 13 to 24 mm. thick, and in places thicker still. The operation lasted from the 7th of March to the 11th of May, and during that period at intervals the pipe was filled with dilute hydrochloric acid eight times, with soda solution three times, and with a solution of chloride of lime once, being washed out thoroughly with water between the successive applications. It was stated that the incrustation was entirely removed, and the practical effect of the cleaning was indicated by the pressure gauge, there being a decrease of from 1.8 to 2 atmospheres pressures at the pump.

SETTLEMENT OF MASON WORK.—It is reported that the outside of the tower of the new public building at Philadelphia has become cracked, and that the cause has been ascribed to the contraction of the brick masonry at the back of the marble facing. The base of the tower of the capitol at Hartford, Conn., shivered a few years ago, because the builders, in their desire to make good joints in stone masonry, laid them with contact at the edges. The difficulty was repaired by pouring a number of tons of melted type metal at the back of this masonry, the alloy expanding as it cooled transferred the pressure from the front edges toward the middle of the tower foundation; the surface blocks were dressed over again, and in some instances new stones were laid in.

CLEANING CLOCK AND WATCH MOVEMENTS.—The movements of a clock can be readily cleaned by placing it for a few minutes in a boiling hot bath compound as follows: One quart of water, one teaspoonful of liquid ammonia, into which should be placed about a great spoonful of scrapings of common soap. The articles should remain in the bath about 30 minutes, then be removed and wiped dry. The entire movements of a clock may be so treated to advantage without taking them apart. It is better, however, to take them all apart and polish each separate piece with a brush dipped in some delicate polishing powder, when they will look like new.

THIN VS. THICK GAUGE BAND-SAW BLADES.—One who has had considerable experience in the use of the hand-saw says: It is generally held that thick gauge saws are the most durable, from the fact of their strength. Against their use there is the drawback of their waste of wood in the attrition of the saw and the necessity of the use of carrying wheels of large diameter. One great point in the durability of band-saws is to sharpen with a round-edged file, the breaking points of the saws always being in the sharp angles of the teeth.

A NEW TANNING AGENT.—According to the *Arizona Gazette*, a new tanning agent has been discovered in that Territory which bids fair to become of considerable importance. The statement is made that a tanner at Temple, Arizona, two or three years ago discovered a plant which carried a large proportion of tannin, and which, when used in the manufacture of leather, gave extra weight to the product.

The plant is of annual growth, indigenous to the deserts and dry uplands, and is known to the Mexicans and Indians as "gonagra." It has a root somewhat longer and more scraggy than the cultivated beet, though resembling it in appearance. It is said to contain a very large per cent of tannin, and to make a good substitute for oak bark.

THE REDWOODS.—Theories and explanations in regard to the question why redwood should only be indigenous to a limited portion of the Pacific Coast have often been given and answered. There is little doubt, however, that in former times the whole of the Coast Range of mountains was completely covered by that growth. How they were destroyed none but Omniscience knows. If they died a natural death, beaten and huffed by the elements or finally succumbed only to old age, there must have been a great climatic change on this coast. The change is probably that of severe summer droughts, from a former more rainy era, thus drying up the tender shoots of the young trees. Gradually, too, the ground has become too arid for the support of even those of more mature growth. The inquiry is a very interesting one.

SUBSTITUTE FOR BRISTLES.—The fibrous bark of the sugar palm (*Arenya saccharina*) proves to be a good substitute for bristles and animal and human hair. The treatment is simple. The bark is first immersed in water, and boiled for some time in an alkaline solution; the fibers are then soaked in an emulsion of fat, alkali and water, for about 24 hours, after which time they are sufficiently hard and elastic for the above-named use.

FOR POLISHING OLD FURNITURE.—The subjoined simple preparation is said to be desirable for cleaning and polishing old furniture. Over a moderate fire put a perfectly clean vessel. Into this drop two ounces of white or yellow wax. When melted add four ounces of pure turpentine, then stir until cool, when it is ready for use. The mixture brings out the original color of the wood, adding a lustre equal to that of varnish.

THE FIRST CAST-STEEL SAW.—The elder Hoe, founder of the firm of R. Hoe & Co., printing press makers, is said to have been the first man in this country who made saws of cast-steel, and the first in New York to drive his machinery by steam.

ORIGIN OF THE SAW.—Grecian mythology tells us that the inventor of the saw once found the jaw-bone of a snake and used it to cut through a piece of wood, then imitated it by jaggung an iron plate, and thus made a saw.

THE REDWOOD POSTS of a fence erected in Napa thirty-two years ago were recently removed, and found in as good condition as when first put into the ground.

IF THE MANDREL is a tight fit when cold, it will be apt to spring the saw when it is heated.

GOOD HEALTH.

Rubbing Swellings and Bruises.

When a thorn pierces the flesh, or an insect bites or stings us, we instinctively rub the part. Why? Whenever

"The boy who rides upon the pig,
Is made to feel the beechen twig."

he claps his hands on the parts that smart and rubs them vigorously. Why? For the reason that the normal condition of the circulation of the vital fluid has been interfered with, and Dame Nature prompts the use of the hand, by way of rubbing, to maintain the natural circulation. When the flesh is bruised, the blood is obstructed in its passage through the tissues of the fleshy parts of the body. By rubbing immediately, before the blood has time to coagulate, the natural passages are kept open and the normal circulation will be maintained. By forcing the blood all out of the bruised part, fresh blood will immediately flow in, and the injury to the flesh will be repaired much sooner than if the affected part was not rubbed. Several years ago I bruised one knee, which seemed but little more than a flea-bite. After a lapse of a week the little bruise began to swell and I was scarcely able to walk. I consulted two excellent surgeons in New York, who shook their heads at the swelling and said they "feared I would have a bad knee." Their remedies utterly failed to reduce the swelling or mitigate the pain. I then tried rubbing and a stream of water. For about half an hour at a time, several times a day, a small stream of water was directed on the knee while I rubbed it. In a week the knee was completely cured. At first the part was so tender that I could not endure the weight of the hand; but by rubbing gently, and then a little harder, the pain ceased and the normal circulation began to be established and the swelling gradually disappeared. Bruises and swelling may often be driven away and cured by rubbing, when medicine would have but little influence.—*E. E. Tee, in Herald of Health.*

HEALING PROPERTIES OF WATER.—There is no remedy of such general application and none

so easily attainable as water, and yet nine persons in ten will pass it by in an emergency to seek for something of less efficacy. There are but few cases of illness where water should not occupy the highest place as a remedial agent. A strip of flannel or a napkin folded lengthwise and wrung out of hot water and applied around the neck of a child that has the croup will usually bring relief in ten minutes. A towel folded several times and quickly wrung out of hot water and applied over the seat of the pain in toothache or neuralgia will generally afford prompt relief. This treatment in colic works like magic. We have known cases that have resisted other treatment for hours yield to this in ten minutes. There is nothing that will so promptly cut short a congestion of the lungs, sore throat or rheumatism, as hot water when applied promptly and thoroughly. Pieces of cotton batting dipped in hot water, and kept applied to all sores and new cuts, bruises and sprains, is the treatment now generally adopted in hospitals. Sprained ankle has been cured in an hour, by showering it with hot water poured from a height of ten feet. Tepid water acts promptly as an emetic, and hot water taken freely half an hour before bedtime is the best of cathartics in the case of constipation, while it has a most soothing effect upon the stomach and bowels. This treatment continued for a few months, with proper attention to diet, will alleviate any case of dyspepsia.

NAPHTHOL.—The extraordinary power of naphthol as an antiseptic and disinfecting agent has been known for a long time, but its disagreeable smell and the difficulty of preparing it in a purified state, with the occasional toxic action of the crude naphthol, have been a bar to its use as a remedial and antiseptic agent. Justus Wolff, a chemist interested in coal tar products, has recently succeeded in producing it in a pure and odorless state in well defined crystals, and claims its antiseptic action is much greater than that of carbolic acid. Recent research has demonstrated that the toxic effects of crude naphthol were due to the impurities it contained. Dr. Shoemaker, of Philadelphia, in a paper read before the Philadelphia County Medical Association, on the "Medical Use and Value of Naphthol," conclusively proved the non-poisonous character of the purified or odorless naphthol by taking large doses internally. It has no corrosive action on the skin, and will not injure textile fabrics. As a remedial agent it acts with greater efficiency, and has many advantages over carbolic acid; the fact of its being absolutely odorless will make it a desirable substitute. It is expected that it will shortly be produced on a manufacturing scale as a substitute for carbolic acid.

CONSUMPTION IN CHICKENS.—A discovery has been made in France which gives us a useful lesson. At Charenton, a man sick with consumption was put in charge of a poultry yard, which in that country are very abundant. Shortly afterward the chickens began to be sick and to die off in a strange way, and one of them was sent to the Veterinary School for examination. Its lungs and liver were filled with tubercles and bacilli, or germs. The fowls had evidently eaten the expectorated matter from their diseased attendant; at least this is the theory, and it seems reasonable, and adds to the evidence of the infectious nature of the disease, and also shows us that men and animals may each communicate their diseases to others.

LEECHES.—The best leeches come from the pine districts of New Jersey, but the most of them come from Sweden and Norway. They are imported into this country by a firm whose office is in Maiden Lane, New York, who collect orders from their customers and make but one general importation, receiving fully 2,000,000 leeches per year. The average price is about \$8 per thousand, and the cost price and freight are about \$2. The profit is simply enormous.

REFRESHING DRINKS FOR INVALIDS.—Lemon water: Cut a lemon into slices, put them in a jar or pitcher and add a heaped teaspoonful of sugar and a pint of hot water; let it stand until cool; strain into a bottle; place on ice until wanted. Apple water: Is an agreeable beverage for feverish patients, peel and slice a sour apple, add a small piece of lemon peel and three lumps of sugar; pour hot water over them and strain.

A CURIOUS FACT in connection with cremation is the amount of ashes received from a body and the disposition made of them. The two largest bodies cremated in Philadelphia weighed 200 pounds each, the ashes weighing 4 pounds 8 ounces and 5 pounds 4½ ounces respectively. The largest percentage of ashes thus far received was from a body weighing 180 pounds, and whose ashes weighed 5 pounds 11 ounces.

SINIGLES.—The cause of this complaint is as yet unknown. It is a painful skin eruption, affecting one-half of the body, from the spine to the breast bone. The cure is affected by means of wet bandages to the part, and a simple diet of fruit and farinaceous foods, in about a fortnight's time.

EIGHTY AND OVER.—A committee of the British Medical Association is collecting information concerning the experience and habits of persons who have attained the age of eighty or over. Interesting results are expected.

MINING SUMMARY.

The following is mostly condensed from journals published in the interior, in proximity to the mines mentioned.

CALIFORNIA.

Amador.

DISCOVERY OF A SILVER LEDGE.—Amador Dispatch, Sept. 5: There seems to be no end to new discoveries in this vicinity of late. Messrs. Mello & Costa have, within the past few days, struck a lot of fine looking rock in their claim at the little town of Jackson Gate, about a mile from the town of Jackson. The peculiar appearance of the rock induced them to have some of it assayed to see what it contained, and the result of the assay shows that it contains \$52 in silver and \$4 in gold per ton. The rock was taken out of the shaft at a depth of about 60 feet, at which depth the ledge has been penetrated to the distance of about four feet. It is not yet known how deep or how wide the ledge will prove to be, as work is progressing very slowly on account of so much water in the shaft. But the discovery of the fact that the ore contains such a large amount of silver is creating quite a stir among the miners, as it has not heretofore been supposed that there was any great amount of silver in the rock in this vicinity. A specimen of this rock was left at our office last Wednesday which can be seen and examined by any one who may be acquainted with silver ore. The owners of the mine felt highly elated over their new discovery, and are opening up the ledge as fast as possible.

BUNKER HILL.—Ledger, Sept. 5: We understand that the sinking of a new shaft, north of the present shafts, has been decided upon by the managers of this prosperous mine. A contract to furnish 75,000 feet of lumber for this purpose has been made with H. C. Farnham. The shaft, we presume, will be commenced at once, as some of the lumber has to be delivered this month.

MAHONEY.—An agreement has been filed for record in the Clerk's office which will be hailed with satisfaction by the people of Sutter Creek. The parties to the agreement are the Valentines and Fitch, owners of the Mahoney mine, on the one side, and Julius Leszynsky, of San Francisco, on the other. The document is dated August 28th, and its terms are that within three months from signing the agreement the said Leszynsky will commence operations in developing the Mahoney mine, and within four months from the commencement of work thereon he will spend \$10,000 in said development. He further agrees, within 15 months therefrom, to expend an additional sum of \$25,000. When this expenditure of \$35,000 is completed, the owners agree to deed to said Leszynsky one-half interest in said mining property.

MISCELLANEOUS.—Antone Mello and A. Questra have made what may turn out to be an important mineral discovery at Jackson Gate, a short distance in the rear of Chichizola's store. In prospecting at the depth of 50 feet, following small veins of quartz, they came across a body of ore several feet thick, which is pronounced by good judges to be of excellent general character. An assay of the ore gave \$4 per ton in gold and \$52 in silver. It is one of the rare instances in this county of silver being met with in paying quantities. The value of the discovery depends upon the ledge extending to a much greater depth, and to determine this question the erection of hoisting machinery will be necessary.

Operations so far have been carried on by hand windlass. F. A. Huntington, of San Francisco, proprietor of the roller quartz mill bearing his name, paid a visit to the Doyle quartz claim in Hunt's gulch the past week, with the idea of securing an interest therein, should the prospect be deemed sufficiently encouraging. He took to San Francisco with him a box of the ore for testing purposes. The Doyle is considered a promising property, and should the pending negotiations be perfected a mill and other improvements will be erected at an early date. W. A. Nevills has gone to San Francisco to make arrangements for the addition of 30 more stamps to the Bechtel mill at Angels, Calaveras county. It is reported that W. H. Rose will shortly take charge of the property. The reconstruction of the old Martell ditch, to convey water from Jackson creek to Carille & Co.'s claim, $\frac{1}{2}$ miles west of Jackson, was completed last week. It took 10 men 18 days to complete the job, and involved the construction of 2700 feet of flume. The ditch will carry about 100 inches of water.

Calaveras.

VALLECITO DISTRICT.—Cor. Mt. Echo, Sept. 4: Having arrived from the Alps of Calaveras to the great vale of San Joaquin, I seat myself and according to promise proceed to give you and your readers a partial account of the mines and mining enterprises of Vallecito district. We find the mining industry of that section at a very low ebb. The surface or placer diggings are partially suspended owing to scarcity of water. The gravel or deep mines are numerous and probably are destined to be the richest in the county. Considerable prospecting in the latter mines is going on at present. I will mention a number of claims that are reputed to be rich in gold. The Don Pancho Gravel Chispa claim, situated on the south of Balaklava hill, was discovered a few months ago. Your correspondent had the pleasure of seeing some large nuggets that had been taken out—one of them a three oz. and the others from two down. The lucky owners say that they have taken out something less than 100 in ten days' run. The Moffit & Barnes Gravel mine, situated on Balaklava hill, is probably the richest mine of the kind that has been struck in that district for a number of years. This mine was struck about a year and a half ago, though they have owned the ground for 18 years. This mine pays too well for a man to attempt to give the exact amount of gold extracted from its bed of gravel since its discovery, suffice it to say that it prospects from one to ten dollars per pan. Moyle & Co. are prospecting in the Padgett hill and anticipate striking a rich deposit of gravel. Another very rich strike was made in Vallecito recently. A nugget was found valued at \$45. Modesty forbids mention of names: As for deep gravel diggings and an opening for capitalists there is no better place in the county than Vallecito. There is some very fine quartz situated about the place, though there is but one mine being worked at present. The Mollie Sloan is a new quartz mine

that has recently been discovered and is destined to be one of the richest mines outside of Angels. The rock prospects from \$20 to \$50 per ton. Mr. Sloan is making arrangements to have a new arastra put up to work it. Old Vallecito has a bright future before her in the way of mining.

Inyo.

DEFIANCE MINE.—Independent, Sept. 5: At the Defiance mine seven or eight men are at work, the prospect is good and business begins to liven up a little.

LOOKOUT.—Over at Lookout Frank Fitzgerald has eight or nine men at work, and report says he is doing well.

ORE RETURNS.—Inyo Reporter, Sept. 3: S. P. Roberts has just received the returns from ten tons of Pine Mountain silver-lead ore he recently shipped to the Selby Works, and is well satisfied with results. The lot averaged 68 per cent lead, and 63 ounces silver per ton. The high percentage in lead makes this a valuable shipping ore, as were other lots from the same mine shipped by Mr. R. heretofore. We have never seen the mines on Pine mountain where Mr. Roberts has been digging away for years, but we are well assured that right there are some splendid mines, well worth the attention of men of means, particularly those desirous of finding a concentrating proposition. Ores, water and wood are there in abundance; of course, the carbonates, or second grade ores only are involved in this proposition, since the galena ores are not susceptible of further concentration, that is, as a class. Pine mountain is about 13 miles east of the railroad, going via Black canyon; one half the distance is over a fair wagon road, the remainder a pack trail only, but over which a good wagon road can be built for about \$2000. Mr. Roberts is now packing out 30 tons more of ore, already on the dump.

PANAMINT.—A large amount of freight, comprising provisions, tools, etc., for Panamint passed down the road last Saturday. The work of repairing the road up the canyon to the town of Panamint will keep a number of men employed two or three weeks. A ten-stamp mill is to be built and set to work as soon as possible. The engines and other portions of the machinery of the splendid mill that was burned are to be used in the new one.

Mono.

BENTON.—Cor. Inyo Reporter, Sept. 3: Mining on the hill goes along steadily; more men are at work at present, than have been for a long time; and outside of those working for wages in the Borasca, every one is on his own hook, prospecting and developing the various ledges. Several are taking out nice lots of ore. The fatal accident to James T. Fregembo, last week, has stopped the work at the Kearsage for a while. The shaft as far as it has been sunk is the best timbered and most complete of any on the hill, and the opening of the drifts started were secured in the best possible manner. Most of the dead work had been done, and deceased was in expectation of soon being able to send for his family. Hugh Jones was down the other day from White mountains, and says they have cut the ledge again with the lower tunnel and have started to drift on the vein. Prospects are looking good and the ore a fair average, while some of it is even better than was found on top.

STANDARD CON.—Bodie Free Press, Sept. 7: The west drift 300-level advanced 11 feet. North drift 325-level advanced 12 feet. South drift advanced 15 feet. East drift advanced 8 feet. Second south drift, same level, advanced 13 feet. The work of retimbering the shaft and 400-station is progressing favorably; this work has prevented the raising of ore, and consequently no men have been employed in drifts below the 325-level. Expect to so far complete the repairs as to resume raising of ore on or before the 15th.

BODIE CON.—During the past week the east drift 700-level was extended 9 feet. No. 1 south drift, same level, was extended 14 feet. No. 2 south drift is in 20 feet. East drift 550-level is in 24 feet. South drift second incline level is in 33 feet.

MONO.—The joint south drift 400-level is in 75 feet. The south drift 650-level is in 18 feet. Winze No. 1 550 (Lent shaft) level is down 102 feet, with good ore in it. We commenced to-day to haul Mono ore to the mill. Eleven men employed.

CON. PACIFIC.—During the past week Winze No. 1 has been sunk 6 feet. Total depth 43 feet.

Mariposa.

COULTERVILLE.—Mariposa Herald, Sept. 5: The quartz interests are looking up. Jonathan Mentzer and Andrew Goss are prospecting a vein on Blue Gulch, a tributary of Maxwell's creek. They are running a wide open cut on the vein, which is very laborious and expensive, but the prospects are very flattering. The Reed brothers are pushing work on their recent find and the outlook is still encouraging. The Wide West mine just across the line in Tuolumne county is being worked. A four-stamp mill is being put in position for crushing ore. Parties in San Francisco are negotiating for the purchase of the Cook brothers property, situated near Coulterville. Quartz Johnson is acting as the agent of the Cook brothers. Considerable work has been done in the old shafts and tunnels, putting them in condition for inspection. The people are anxiously hoping a sale will be effected, as it will be everything for the town. The Red Cloud people have let a contract to a party of miners to sink their shaft 100 feet deeper. They have passed through a strata in the shaft that will mill from \$10 to \$12 per ton. Good rock is being taken out of the Hasloe mine. The Compromise mine will start up right away. The water is being pumped out of the mine and Anthony Stolder has a contract to furnish 200 cords of wood for the mill. A party from San Francisco wants to buy the mine, and the owner, Mr. Gage, says he will sell it if they pay him his price; but it makes no difference whether they take it or not, as he intends to work it anyway.

Nevada.

YOSEMITE MINE.—Grass Valley Union, Sept. 5: The Yosemite Mining Company, whose claim is situated on Banner mountain, has resigned the latest assessment of two cents per share upon the capital stock of company, for the reason that the quartz taken from the mine during the past month more than pays all expenses, and from present appearances will continue to do so. The last crushing gave a yield of \$25.75 per ton.

Placer.

STARTED UP.—Placer Herald, Sept. 5: We learn from W. R. Monahan, of Ophir, who was in town Thursday, that the owners of the Boulder mine, which is located near the town of Ophir, are putting up the necessary works and getting things in order generally for working the lead thoroughly and systematically. If the Boulder and the Greene, both of which have yielded rich ore, are put in full operation again, they will make things around Ophir pretty lively and from the stimulus Auburn will receive no little benefit.

DIVIDE DOTS.—The paying mines hereabouts are letting down bountifully, the Mayflower having, it is said, produced \$10,000 one day last week, and prospects abundant for the continuance of large returns for an indefinite period. Charley Marley, of San Francisco, has been for some time pumping out the Excelsior mine for the purpose of recommencing work on the high rock. The water is now on and workmen have been put on. The Washington is still running drifts in the rock. The neighboring mine of Breece & Wheeler, at Bath, is also taking out pay dirt, but will have to lay off some of their men until they have raised their new chute and judging from the prospects of the grave in sight, will again be taking out richer pay than for a couple of years back.

MICHIGAN BLUFF ITEMS.—Placer Argus, Sept. 5: A. C. Bowen, J. L. Gould and O'Donnell have begun work on a drift mine called the Hermit, located on the main channel, between the Hidden Treasure and the Orion about six miles above Michigan Bluff. They have eight or ten at work at present in running a bedrock tunnel, and they intend to prosecute the work vigorously until they strike the channel. Ed. Polifka, W. F. Croft, Ed. Kavenagh and other parties have located the ground known as Robinson's Flat, above Canada Hill. The company will begin work probably this week, getting out timbers, starting a tunnel, etc. Just below this claim is a mine operated by Spaniards—they call it the Screw Anger—in which considerable coarse gold has lately been found. Michigan Bluff is livening up again and we are hoping for still better times by and by. A good deal of prospecting is going on all over the divide, from Forest hill up. Work was resumed on the Hazard mine last week under the experienced supervision of Col. J. H. Keown, the former superintendent. The mine will be run by an English company having a large capital, and this, we firmly believe, to be all that is needed to develop one of the richest mines in the State of California.

Plumas.

GIBSONVILLE.—Mt. Messenger, Sept. 5: The Union Company are raising an air shaft, working three shifts. About 150 feet has been completed, with 250 feet more to run, when drifting will be resumed. Water is very scarce, and there is just sufficient for prospecting. The gold yield this year has been quite large and profitable for its lucky owners. A \$1500 timber contract is now being filled by T. Delahanty. The Go-Ahead Company are running a tunnel down near Wallis creek. The rock is very hard, costing \$20 per foot for blasting. Elias Squier and his father are running a bedrock tunnel to tap the ground that pitched off from them on the high rock last year.

PLUMAS EUREKA.—Oroville Mercury, Sept. 5: A six-stamp mill is constantly operating, crushing on an average 120 tons of rock per day, and gives employment to 40 men, mostly Cornish men. The running expenses average not less than \$25,000 per month, and two communities, Johnsonville and Eureka Mills, containing at least one thousand inhabitants are supported entirely by the mine. The mill is situated on the side of a hill, about 3000 feet below the mouth of the upper tunnel, from which the quartz is taken. This quartz is placed in a car and run down the mountain on a track at an angle of about thirty-five degrees, and on this car one can enjoy one of the most picturesque and exciting rides imaginable.

Siskiyou.

METHODIST CREEK.—Yreka Union, Sept. 5: Methodist creek is a permanent stream that empties into the south fork of the Salmon at Yocumville. Yocumville is about 40 miles from Etna and 70 miles from Yreka. From Etna it is reached by good mountain trails, over which the mail passes. The head of the creek is blocked up with snow during the winter, but, except in very severe winters, the parts that would be probable to have ledges and in which quartz has already been discovered, would be accessible at any time. Upon the stream several ledges have been found at various times, but prospecting has only lately been carried on to any extent. The ledges found prospect well but have not as yet been fully developed. The country is well timbered and watered, and from its extent has only been glanced at in places. There are about 20 or 30 men now on the creek. There is a store at Yocumville, and the camp of New River is on the south side of the divide separating New River from Methodist creek and south fork of Salmon.

Tuolumne.

WATER.—Union Democrat: There was a large influx of water into the Lamphier mine last week. So great was the flow the pumps could not handle it. In consequence operations have been suspended below the 217-foot level. It is, however, the opinion of the superintendent that the heavy flow of water will only be temporary. This excess of water does not interfere with the operation of the mill, as all the ore being crushed is stopped from the South shaft where the water is not troublesome. The mill was cleaned up last Sunday, but we could not learn the amount of the shipment.

LOOKING WELL.—Tuolumne Independent, Sept. 5: Nervi's mine is looking very well. The mill hammers away and the plates indicate a good cleanup. Mr. Keefe, of Summit Pass, is preparing to open up his mine which is located in his field. This promises good reports. Placer mining is suspended for the time being, the supply of water having been exhausted.

SOULSBYVILLE.—The celebrated Bone-Crusher has started up. The superintendent is kept well supplied with bones. The present price paid for them is 50 cents per hundred pounds. If the bone-crusher runs many days longer there will not be any left, as the boys are busily engaged gathering and hauling them for the crusher. If anyone in Sonora has any to sell, call around this way and inquire for the superintendent of the bone-crusher. The Black Oak hoisting works were completed on Monday and

run very well. News has been received that water in the Soulsbyville branch ditch will be cut off this week, and in consequence thereof, they will be obliged to stop until water comes again. It is bad for the company, and the gardeners also. They will be obliged to start up at the Soulsby mine by steam, which is considerably more expensive, as water power is cheaper than steam. They will also stop the mill till water comes again. Jas. Burns is hauling the lumber along the river hill to where the flumes are to be built to bring water for the mill at the Buchanan mine. It is said it will take him a month longer to get through with his contract. They have out several tons of ore at the Morning Star mine, near Cherokee, and have been repairing the Louisiana mill to crush it. The water to run this mill comes from the Soulsbyville branch ditch, and are, therefore, unable to start up the mill on account of the water being turned off. This ditch also supplies some of the gardeners near Cherokee, so they will be without water, as well as Soulsbyville gardeners. It is reported here that the water will not be turned into the Soulsby branch ditch until rain. If this be the case all the gardens here will suffer for want of water. They have a good vein on the Pennsylvania mine. Some of the rock shows gold very well. Contracts were let at the Soulsby mine Tuesday. There will not be as many men working this month, on account of the water being turned off. Mr. Kiley Gilkey is expected back from the city the first of next week, when he will start up his mine at Jamestown if he makes satisfactory arrangements below.

Trinity.

MINING INVESTMENT.—Trinity Journal, Sept. 3: Mr. A. P. Minear, of San Francisco, has purchased from Mrs. H. E. Willey the Vermont mine in Deadwood district, and is now arranging for working said mine. He has on the way a Huntington mill and two Frue Concentrators and will commence work with about fifteen men. It is not his intention to crowd matters on the start, but rather to cautiously feel his way, although he has the most implicit faith in the outcome of the mine he has purchased, as well as to the future of Deadwood district in general. There have been no failures there so far and we feel that Mr. Minear has made an excellent investment. Parties in town have discovered what may ultimately prove a bonanza in the shape of a $\frac{1}{2}$ foot ledge on Broken Nose gulch, a tributary of Sidney gulch, in Weaver Basin. Work is now being done on it and encouraging prospects found. The interested ones are confident that they have "found it." However, it will take time and labor to substantiate the fact. We hope that it will "pan out" to their fullest expectations.

NEW RIVER.—Cor. Humboldt Standard, Sept. 5: One of the finest mines visited is the Hard Tack, situated on the divide between Larcenville and New River city. This ledge is, on an average, eighteen inches and reached at a depth of 170 feet by an incline shaft. The rock already tested yields on an average \$50 per ton. The company have a great amount of this grade of ore on hand. The only excavations made so far are by shaft and tunnel. The next place visited there was the Kidgeway mine. It is owned by George Dean and others, of Eureka, and is supposed to be an extension of the Hard Tack. This is opened in a workmanlike manner by two tunnels and an incline shaft. The ledge in the upper tunnel and shaft makes a good showing. The lower tunnel, or crosscut, is for the purpose of a draining and working tunnel. This arrangement shows that good judgment was used in opening the mine and sound sense as to the advantages to be obtained in future working. Part of the rock taken from this mine was milled and yielded about \$40 per ton. The ledge varies from three to twenty-five inches in thickness as one goes down. Still down the ridge in a westerly direction are three other claims—the Armstrong, Sullivan, Miller & Co.'s and the Salina, the Sullivan ledge being the most extensively developed of the three. An incline shaft is down close to one hundred feet in it, with a continuous ledge of quartz the whole distance, varying in thickness from six inches to two feet. From the amount crushed in a hand mortar, which is a bad test, the rock would yield \$25 or \$30 per ton. This ridge seems, in my opinion, the principal ground of operation. As far as developed it has the best showing in the country. The rock is soft and there is every reason to believe that the body of quartz should continue down. We can safely say the five claims would produce 6000 tons of quartz. At this stage of development the Hard Tack has an arastra for reducing some of the ore. This is situated just below New River city and about one and a half miles from the mine. In company with Mr. Dean we visited the Mountain Boomer mine, located on the south side of Slide creek. They have some very rich croppings and also an arastra for working the same. The mine is not developed to that extent to judge of its future, although they have a large amount of decomposed quartz, which is worked on a very cheap scale. The general drawback to the district is the lack of a mill to crush the rock. A custom mill of four or five stamps could be placed in the vicinity and command the entire country, as there is sufficient paying rock to justify this procedure. A mill of this sort would enable miners to crush their quartz and supply themselves with means to make more extensive developments. In their present condition, time and money have been expended toward opening these claims and nothing is left for the erection of machinery. The water privilege is good for six or eight months of the year and for a small steam engine the year round. Timber to construct mills exists in abundance. At Butcher creek and vicinity several parties are engaged in making openings in small stringers, but nothing extensive enough to justify one in forming an opinion of the mines has been made. The Uncle Sam mine looks favorable for a continuous claim. The vein stands nearly perpendicular, with good walls, and is opened in a fair way for working a small mill and donkey engine on it, but not one of much force for crushing rock. It is not for me to say definitely what the district will be in three years, but in my opinion, from past experience and close observation during four days in the camp, it is the foundation for a better camp than any other locality in northern California, providing men of experience and energy are secured to execute the work.

NEVADA.

Washoe District.

HALE AND NORCROSS.—Enterprise, Sept. 5:

The station on the 3100 level is full opened, and the drift practically started in a southeast direction to connect with the drift coming northwest from the combination shaft on the same level. Some very good streaks of ore have been met with in opening the station, and owing to the diagonal direction assumed by the drift, it does not cut across the ore vein as rapidly as it would were its course directly east, therefore ore development need not be too suddenly looked for. The management at the office yesterday seemed a little reticent, as though they had good things in view not necessary to tell about, all of which, however, will come out in due time. Archie Morland is here yet, and expresses himself as very sanguine in the matter of developing the long promised bonanza.

CROWN POINT.—The repairs and overhauling of the machinery continues, and work in this part the Belcher mines has not been resumed as yet, notwithstanding the popular idea that it would be the first of this month. The flume of the Mexican mill is being put in first class repair, being, in fact, renewed from beginning to end, and the Santiago mill is also being put in most thorough order for a new reduction campaign when the state of the water in Carson river will allow of renewed milling work. Nothing will be done in Belcher until work is resumed in Crown Point.

CON. CALIFORNIA AND VIRGINIA.—The usual amount of about 125 tons per day continues to be yielded from the 1750 level on company account, the average assays being \$18 per ton. About 60 tons per day are extracted from the Jones lease section above the 1550 level, assaying about \$14 per ton. The ventilation of the mine is now very much better and more advantageous work being done.

CHOLLAR.—Work progressing in the croppings preparatory to the extraction of low grade ore. The station on the 3100 level of the Combination shaft is fully opened, and the main drift west from it going ahead finely. The face of it is already advanced 112 feet west from the shaft.

UNION CONSOLIDATED.—The main lateral drift north is making good progress, being now within 50 feet of the Sierra Nevada south line. The formation continues to be vein porphyry and quartz, and the chances are favorable for a good ore development in that direction.

GOULD AND CURRY.—Crosscut No. 1 west on the 1000 level has been advanced 42 feet during the past week, making a total length of 328 feet. The face continues in vein porphyry, clay and quartz, with no new feature of a favorable character.

YELLOW JACKET.—Something over 200 tons per day continues to be the yield from the old upper workings above the 1300 level. The ventilation of the mine is of a very superior order throughout, allowing of effective work being done.

ANDES.—Drifting west on the 175 and 375 levels continues under the most favorable auspices, the principal feature in the way of new developments being the assessment of twenty-five cents per share levied yesterday.

SIEKKA NEVADA.—On the 520 level the west crosscut has been extended during the past week 45 feet, making a total length of 200 feet. The face continues in dry, hard porphyry, with streaks of clay and quartz.

JUSTICE.—About twenty tons per day continue to be extracted from the southern portion of the mine, on the 450 level, through the Woodville shaft, and reduced at the old Thompson mill.

ALTA.—The main drift west on the 700 level has been advanced to the extent of 118 feet, and making very good progress considering the very hard nature of the rock encountered.

MEXICAN.—Running the middle crosscut east is the principal business of this mine. It is now in about 100 feet, running in a wet, heavy formation of clay, porphyry and quartz.

KENTUCK.—The usual amount of ore continues to be yielded from the old upper workings, which is hauled to the Rocky Point mill on Carson river by teams for reduction.

OPHIR.—The repairs to the old Mexican shaft for ventilation and prospecting purposes still continue.

ARIZONA.

HUMBURG.—Prescott Courier, Sept. 4: T. W. Cochrane, the superintendent of the West Humburg quartz mill belonging to the St. Louis-Yavapai Mining Co., is now in Phoenix, his mill being shut down at present for want of water. We learn from the *Herald* that the company has let a contract for sinking 100 feet on the Gold hill. Mr. Cochrane has recently devised a plan by which these ore may be profitably handled for \$15 per ton, and on the strength of this the company is now purchasing such ores at 80 percent of the total value per ton.

PINAL.—Two miles of ledge from 80 to 100 feet wide and carrying ore of exceptionally high average is being developed by Judge Reymert. The Tucson *Star* devotes two columns to the description of this property, describing it as a second Comstock. The ledge is a contact vein between slate and syenite and pays from \$8 to \$400 per ton, two of the claims very much exceeding this. The owner has expended over \$50,000 in developments and has refused an offer of \$150,000 from the bonanza company. The Specie Paying company's mill is now running on the ores from these mines and works it up to 90 percent of assay. The *Star* pays a high compliment to Judge Reymert for his energy in paying all the heavy expense of developing this handsome property out of his professional earnings as a lawyer. The Tomestone M. & M. Co. paid \$23,500 for the Way Up and Gilded Age mines, says the *Record-Epiphany*. Another smelter will be put up on the San Pedro by Judge Robinson.

SALERO.—The Salero camp near Tucson has only recently come into importance as a hulsion producer. The *Citizen* states that the Waddell mill and mine are employing 37 men, and 50 chlorides get their ore worked there. Large quantities of horn silver are found.

COLORADO.

OPHIR NOTES.—San Miguel Journal, Sept. 5: Sam Twigg came down from Bridal Veil basin Sunday morning and reported that he had struck it big in the Benedictine. Mr. Twigg brought down some very fine gold specimens which he says are a fair

average of a pay streak a foot wide. The work on the mine consists of a 20 foot open cut and 40 feet of drift. George W. Pickett, formerly landlord of the Silver Mountain house, was in Ophir last Sunday. Mr. Pickett is owner of the Torpedo mine situated on Silver mountain on the Turkey creek side. A shipment of ore was made last week which ran 114 ozs in silver. As the pay streak is a foot wide 114 ozs will do very well. Al Woodruff has been up to look at the mine and is talking of taking a lease on it. Orrin Parsons says that he has struck a big body chlorides and brittle silver ore in the Two Sisters, a mine situated on Yellow mountain near the mother lode. El Silshy has had a lot of ore from the gold streak of the Dixie tested at the Gold King mill. The returns are not yet in but the showing warrants the belief that it will pay well. Mr. Silshy also had some ore from Ruby Gulch, San Juan county, tested at the same mill. This lot averaged \$16 to the ton. Gold lodes are all the rage at Ophir. J. J. Lashaw had a lot of ore from the Hidden Treasure tested at Goehle & Lane's mill. It ran \$30 to the ton. Mr. Crim has put on a force of men to connect the drift in on the Grand View lode with the drift on the Sulphurets. He is taking out some very fine ore.

IDaho.

ANOTHER STRIKE.—Wood River Times, Sept. 5: George Riddle, who came down to-day from Narrow Gauge gulch, reports a new discovery on Red Cloud ground, made this morning. While prospecting on the surface, at a point about 300 feet above and 100 feet north of the mouth of the tunnel, he struck a vein of galena which he and Mr. Macon uncovered at once. In less than two hours they had extracted over one ton of clean, solid galena ore, in chunks so large that they are too heavy for one man alone to lift. The news soon spread in Narrow Gauge gulch, and all the miners and prospectors in the vicinity flocked to the spot. The ore body appears to be fully three feet in width, and the ore to be clean galena and high grade.

THE GOLD BELT.—Mr. Robertson, an old prospector and miner, who came here at the instance of Mr. Brockway, of the Wiswell machinery, is visiting the Gold Belt. He is very favorably impressed with this region, and thinks we have as fine a country as lies outdoors.

MOKE SMOKY ORE COMING IN.—Pierce Dorgan came in from Smoky last evening to look after the sampling and sale of another load of ore from the Smoky claim, which he owns in partnership with Messrs. Rafter and Menas. The ore was brought in by J. O. Swift's teams. These teams make a round trip every six or seven days, and move about 20 tons per trip. They are retained for most if not all the season already, the ore being piled on the mine dumps, awaiting its turn for transportation. Next trip the teams will bring ore from Mr. Dorgan's Galore claim.

FROM NARROW GAUGE GULCH.—J. F. Kunkle came down from Deer creek to-day. He reports the Narrow Gauges as running the jigs day and night, and shipping 3 1/2 tons of first class ore per day. They employ about 15 men. The Cyclops and Red Cloud are looking finely, the French group is improved day by day, and the new hand-jig kept busy.

TWO RECENT STRIKES.—M. T. Richardson, of the Red Elephant group, was in town yesterday, looking pleasanter than ever. Last Monday the lessees struck a vein of solid galena in entirely new ground, on the Queen Fraction, which although not over three inches wide, is quite rich, and will pay good wages. In addition to the galena there is about six inches of jiggling ore that will also pay to extract. The galena, so far, has been of uniform width, but it is expected to widen in depth. This strike was entirely unexpected, as the miners were running for something else. It was therefore just like "finding it." Yesterday a galena vein between six and eight inches wide was cut into in the heading of the big tunnel on the Red Elephant, at a depth of about 250 feet from the surface and a distance from the mouth of about 500 feet. This discovery is also in entirely new ground, and therefore very encouraging. In a day or two drifts will be started both ways on the vein, to determine its extent.

MONTANA.

RESUMPTION OF WORK ON THE OPHIR.—Inter-Mountain, Sept. 5: The Ophir is a prospect located about midway between Butte and the railroad depot, directly east of the Shonhar, and on a line with that property and the Star West. It has been worked at intervals for some years under lease, but owing to the volume of water encountered in sinking and the poverty of the lessees, it has never had the benefit of systematic development. The Ophir, like other offshoots of the famous Black Chief lode, has produced some very rich sulphurets ore. For more than a year this property has been idle. Mr. Newkirk and the other owners having failed to agree as to its exploration. During the past few weeks, however, it has been under lease to J. M. Venable, Milo French et al. A new shaft has been started about sixty feet south of the croppings and a depth of 40 feet already attained. It is the intention to sink without delay to the 100-foot station, tapping and penetrating the ledge at an estimated depth of 70 feet according to the present dip. Within the past few days a pump has been put in capable of handling all the water that is likely to come into the shaft. Mr. Venable does not propose to stop work until he reaches the 100-foot station, and from that point will crosscut to the hanging wall and drift on the vein. The new shaft sunk on the north side of the ledge is now all in ore in the bottom. The main ledge dips south but the doctor thinks that he has struck a rich offshoot dipping north, as otherwise of course his shaft would have missed it. Dr. Whitford says he made the strike several days ago and that he has four feet of ore in sight which will sample \$100 per ton. He will continue sinking through the new strike which is leaving the shaft and will at a greater depth crosscut and work the ore chute which he firmly believes is of a permanent character as to quality and extent.

THE SALE OF THE NEIHART MINES.—Townsend Transcript, Sept. 5: Col. Broadwater and Mr. Ryan arrived here yesterday afternoon from Neihart, and the same day's coach brought in Messrs. McIntosh and Wells, part owners of the leads at Neihart which had been bonded last spring. The parties were uncommunicative, but we have since learned

from most reliable sources that Broadwater et al have purchased the interest of McIntosh and Wells, and that the deeds of the same are now on record at the county clerk's office at the Springs. We did not learn the exact figures of the consideration, but understand that they are in the neighborhood of \$50,000. As Col. Broadwater has letters of administration on the estate of Wallace Bell, deceased partner in these mines, the present purchase leaves only the interest of James Chamberlain outside of his, and gives Broadwater and his associates a large controlling interest in the property. The purchase money was paid in Helena on Monday, and we expect to see operations on this group of mines resumed immediately.

NEIHART NOTES.—Husbandman, Sept. 5: We are reliably informed that the Mountain Chief mine at Neihart shows a fourteen foot vein of ore at the depth of two hundred feet. James Chamberlain, of Neihart, who owns a one-third interest in the Montana Belle, a one-half interest in the Minnehaha and an interest in the Dickens and Maud S. mines, bonded by Col. Broadwater, refuses to sell for less than the bonded price, regards the mine worth a million dollars, and is confident that if released from the present bond he will be able to sell his interest at the rate of a half instead of a fourth of a million, as it is bonded for.

THE SWEET GRASS MINES.—Inter-Mountain, Sept. 5: The mines are about 120 miles northwest of Fort Benton and about 300 miles from Butte. In going there the party went to Helena and took the Benton road to a point about four miles the other side of the crossing of the Dearborn river. There they left the road, turning to the left. They crossed Sun river about 40 miles above the town, crossed the Teton at the old Blackfoot agency and then made a bee line for the mines. He found the mines in a rolling prairie, there being no mountains in their immediate vicinity. Three buttes, each somewhat larger than the butte west of this city, alone broke the monotony of the view over the level plains. The mines, as far as known at present, are confined to a small gulch about eight miles from Milk river, and 45 miles from the Marias. They are covered by 35 claims, each 300 feet in length. Prospecting above and below this area has thus far failed to show gold, beyond a few very small colors. Bedrock is found from 12 to 15 feet below the surface and is composed of decomposed slate. The pay dirt is taken out by drifting and washed in pans. No rockers or sluices are used, as water is too scarce for the latter, although the former might be employed if they were upon the ground. There are only four or five inches of water running in the gulch. Water might be obtained by taking a ditch out of Milk river, several miles above, but the known area of the mining grounds is so small that no one will hazard the undertaking. Some parties claim to have made as high as \$10 and \$12 a day with pans, but in this estimate no account is taken of the time employed in getting out the dirt. This is packed on mules or hauled in wagons, in some places, from a half to three-quarters of a mile. The nearest timber for either firewood or lumber is 12 to 15 miles distant. No saw-mill is yet built in the vicinity. Everyone lives in tents or roughs it in wagons or such other shelter as may be obtained. Our informant has but a poor opinion of the mines. There is gold there, and if plenty of water was upon the ground good wages may be made for some time to come. But there is no immediate prospect of getting more water. The gold taken out is fair looking and some of it is what may be called coarse. The gravel shows extensive wash, but in some places is covered with a deep layer of clay. When our informant left, bedrock in the main gulch had been reached by only three companies. On side gulches it was shallower and had been struck in several places. The mines are upon the Piegan reservation but the Indians seldom frequent that portion of it. There is no game there or anything else above the ground that an Indian can make use of. The Indians have raised no objection to parties going there, although the agent of the reservation has protested against the invasion. It is not thought, however, that he cares much about it. After carefully looking over the mines our informant came to the conclusion that it was a good place to stay away from by those who have anything to do elsewhere. But for those who are itching for adventure and who are always looking for a fortune under a rock it is a good place to prospect in. If it doesn't cure them there is no place that will. The Butte party that went there last July will remain in Butte. It had enough of the Sweet Grass mines.

NEW MINERAL DISCOVERIES.—Inter-Mountain, Sept. 7: When the thriving town of Anaconda was first laid out, it was supposed that the place would never derive any support aside from what the operations of the Anaconda smelter and the contiguous valley trade would give it. It is a fact, now sufficiently authenticated to warrant publication, that Anaconda promises to loom up as the business center of a very important mining district. A number of Butte men are interested in the late discoveries, and have already expended considerable money in prosecuting development, in some cases with very profitable results. Among these may be mentioned J. D. Thomas and J. Ross Clark, from whose mines some rich ore has already been shipped to Butte for treatment. With the Anaconda works and good mines also, the future of the town takes on an aspect of increased brightness.

NEW MEXICO.

THE SMELTER TO START SOON.—Rio Grande Republican, Sept. 3: The Las Cruces smelter is completed in every part, with nothing left but to light the fires and smelt the ores. We are told by men experienced in the smelting business that the plant is unexcelled for convenience and perfection considering its capacity. It consists of two stacks, a 40-ton galena-silver stack and another of the same capacity for copper ore. Dust chambers for collecting the fine ore and waste gases are in connection with the galena stack. A 50-horse power engine runs the machinery. A Gates crusher reduces the ore to a proper fineness, and a Baker blower, of the largest size, connects with the stacks. The machinery is all modern, of the latest improved pattern. The buildings are substantial; well-arranged laboratory and offices are separate from the main building, as is also a boarding house for the accommodation of the employees. The Santa Fe railroad company have built a side track out to the works. In building the smelter the means of the company were exhausted, but this will not long retard the working of the en-

terprise. Very sensibly they did not attempt to run it without a sufficient amount of money to keep the ore bins always full and so have about completed a lease to Wm. Dussauer, Skidmore and Dougher, owners of the Bennett mine. So soon as enough ore has accumulated to keep the smelter running without delay, the works will be started with a force of skilled employees, sufficient to run it to its full capacity.

PINE CREEK NOTES.—Bedrock Democrat, Sept. 5: The Pine creek mines seem to be attracting more attention abroad than ever, and mining men and capitalists are arriving in this city daily en route to the new El Dorado. Of all those who have paid the mines a visit, not one has returned and spoke disparagingly of the prospects, but on the contrary they have all been most favorably impressed with the outlook and are eager to secure locations or purchase interests. We doubt if there ever was a camp discovered that has met with the unqualified approval of mining men as has the Pine creek district. As the work of development progresses upon the discoveries the richer they become, so rich, in fact, that the report seems incredible. Nevertheless, all one has to do to satisfy himself as to their richness, is to pay a visit to the bonanzas—the evidences are there, and no mistake. While we do not think the camp will become a working camp this fall, considerable work will be done, giving employment to a few men. But the coming spring we look to see the camp flourish, the like of which has not been known for years on this coast. The principal locations will have passed into the hands of capitalists by this time, mills will be erected, and hundreds of men will find employment. All the contract work on bonded mines will be finished Tuesday, and the coming week will tell whether or no actual sale to capitalists has been made. Every shaft sunk or tunnel run has developed the ledges both wider and richer, and there is no doubt felt here but what the mines will be accepted and at least one mill be in operation within the 90 days. J. W. Norton, who has been prospecting on East Eagle, eight miles west of here, and on Little Eagle, five miles distant, has some very promising looking specimens, and informs me that the ledges are well defined and easily worked. Specimens of the East Eagle rock have been sent to Portland for assay. Thomas Hoffman, Clarence White, Jack Eastabrook and Pierce Rogers, returned last Saturday from a prospecting tour in the Pine creek district and report having made numerous valuable locations. The bonded mines, the "Whitman," "Companion" and "Tiger," are showing up exceedingly rich and development progresses. They are now down to a depth of 25 feet on the "Whitman" and are now tunneling 25 feet. It is said that there is now enough ore on the dump of this mine to pay the bonded price and erect a mill. Building is progressing rapidly in Cornucopia and Allen town. Everything booming. Several California capitalists are in the mines and are endeavoring to secure interests. Pine creek, like every other new mining camp, is infested with a set of individuals who will not prospect themselves but are inclined to "jump" locations made by energetic prospectors, but as yet they have failed to commence operations from the fact that the better class in the camp have signified their intention of dealing out swift retribution to all who shall attempt such proceedings. The road from Sparta to the mines is a sure thing.

THE DISTRICTS.—Silver City Enterprise, Sept. 5: S. A. Wellington has commenced a survey of a group of three mines in Bullard's Peak district for the purpose of procuring patents. Joseph McQuerry, a Georgetown miner, made a shipment of ore to Deming last week. The first-class averaged 619 ounces, and the second 75 ounces. W. H. Newcomb has struck a two-foot vein of gold quartz in the Cow Springs district, that promises to be an important thing. Nick Rascom, with whom Mr. Newcomb is interested, is working it, and recent assays are very satisfactory. The following returns have been received from a mine near this city which is abundance of ore in sight, the name of which is withheld for the present. First class 8266 oz. silver, \$1942.98 gold; second class 91 oz. silver and \$30 gold. A body of water was encountered in the adjoining claim to the Old Man on Wednesday that drove the miners out, preventing them from sinking deeper. The superintendent, W. C. Hadley, states that he had figured on striking water and mineral at the same depth. Instead of sinking deeper Mr. Hadley will drift for the vein. Barney Tiernan will return to Europa and take a lease upon the Horner mine, owned by the Massachusetts New Mexico Mining company, and represented by B. Y. McKays. Mr. Tiernan will put a force of men to work upon the property immediately. The main shaft on the lower lead of the Rose mine, shows up a fine body of ore through which native silver can be seen. Owing to the flow of water sinking has been discontinued at the point where the fine showing is. As soon as some means are devised to drain the water work will be resumed upon this ore body. On the upper ledge the main shaft is down 110 feet from the surface, or fifty feet as a winze from the tunnel, where water has also been encountered, obliging the superintendent to discontinue sinking. A drift has been started 35 feet from the tunnel, and native silver and chloride ore shows up well in the face. Sinking has begun from the 550 foot level in the Black Hawk mine again with a good showing of ore to begin with. The mine is looking as well if not better than at any time since its discovery. The ore bodies are not of as high grade but they have every appearance of being permanent. In six different places on the mine ore is exposed and being extracted. The pump recently put in works to a charm. Twenty-eight men are employed upon the property.

UTAH.

MILFORD.—Cor. Salt Lake Tribune: Large shipments of ores are coming in from all points, to be sent north, and if the Salt Lake buyers do the fair thing, they will be worked there; otherwise they will go farther east.

THE CHRISTY COMPANY.—Southern Utah Times, Sept. 7: The late heavy rains washed out the water ditch, necessitating a closing down of the mill for a day and a half. Everything is running smoothly again, and between 40 and 45 tons of ore is crushed every day. A full force of men are at work in the mines, the stopes are furnishing their regular supply and the slight stoppage of the mill caused the dumps of the California and New Shaft to become crowded with ore.

NATIONAL IRON WORKS,

...SOLE MANUFACTURERS OF...

**KENDALL'S PATENT
QUARTZ MILLS.**

Having renewed our contract on more advantageous terms with Mr. S. Kendall for the manufacture of his Patent Quartz Mill, we are now enabled to offer these mills at GREATLY REDUCED PRICES. Having made and sold these mills for the past five years, we know their merits, and know that they have given perfect satisfaction to purchasers, as numbers of commendatory testimonials prove. We feel confident, therefore, that at the prices we are now prepared to offer them, there is placed within the reach of all a light, cheap, and durable mill that will do all that claimed for it and give entire satisfaction.

HERCULES POWDER

HERCULES POWDER will break more rock, is stronger, safer and better than any other Explosive in use, and is the only Nitro-Glycerine Powder chemically compounded to neutralize its poisonous fumes, notwithstanding bombastic and pretentious claims by others.

It derives its name from HERCULES, the most famous hero of Greek Mythology, who was gifted with superhuman strength. On one occasion he slew several giants who opposed him, and with one blow of his club broke a high mountain from summit to base.

No. 1 (XX) is the Strongest Explosive Known.

No. 2 is superior to any powder of that grade.

PATENTED IN THE UNITED STATES PATENT OFFICE.

ORDERS RECEIVED FOR HERCULES CAPS AND FUSE.

THE JENKINS STANDARD PACKING

IS ACKNOWLEDGED BY USERS AS THE BEST in the world. Unlike all other Packings, the Jenkins Standard Packing can be made any thickness desired in a joint by placing two or as many thicknesses together as desired, and following up joint, it vulcanizes in place and becomes a metal of itself (it is frequently called Jenkins Metal), and will last for years, as it does not rot or burn out. Avoid all imitations, as a good article is always subject to cheap imitations. The genuine has stamped on every sheet “Jenkins Standard Packing,” and is for sale by the Trade generally.

Manufactured only by

For Sale by
DUNHAM, CARRIGAN & CO., San Francisco, Cal. JENKINS BROS., 71 John St., New York.

Market Reports

Should this paper be received by any subscriber who does not want it, or beyond the time he intends to pay for, let him not fail to write us direct to stop it. A postal order (costing one cent only) will suffice. We will not knowingly send the paper to anyone who does not wish it, but if it is continued, through the failure of the subscriber to notify us to discontinue it, or some irresponsible party requested to stop it, we shall positively demand payment for the time it sent. LOOK CAREFULLY AT THE LABEL ON YOUR PAPER,

List of U. S. Patents for Pacific Coast Inventors.

NOTE.—Copies of U. S. and Foreign patents furnished by Dewey & Co., in the shortest time possible (by telegraph or otherwise), at the lowest rates. American and Foreign patents obtained, and all patent business for Pacific Coast inventors transacted with perfect security and in the shortest possible time.

Notices of Recent Patents.

Among the patents recently obtained through Dewey & Co.'s SCIENTIFIC PRESS U. S. and Foreign Patent Agency, the following are worthy of special mention:

ROCK CRUSHER OR BREAKER.—Frank A. Huntington, S. F. No. 324,937. Dated Aug. 25, 1885. This improved apparatus for breaking or crushing rock consists in a combination of devices rather difficult to describe clearly without the aid of an engraving.

FAKE BOX.—F. O. Landgrane and M. E. Willis, S. F. No. 325,348. Dated Sept. 1, 1885. This is an improvement on fare-boxes, such as are used in street cars to receive the fares of passengers. It consists in certain details of construction which improve the box ordinarily in use.

BILLIARD TABLE LEG.—Michael Cashu, S. F. No. 324,917. Dated August 25, 1885. The invention relates to that class of billiard table and to certain new and useful improvements in the legs thereof. The object is to provide a simple and effective means for leveling the table and adapting it to be moved.

FEED ROLL.—Philip Hanavan, Oakland. No. 325,339. Dated Sept. 1, 1885. This is an improvement on the feed rolls for wood-working machinery. It consists of removable, adjustable teeth and a means for securing them in the roll. When the teeth become worn they may be removed and others substituted. These teeth can be made of steel.

MACHINE FOR SPINNING HEMP.—A. L. Tubbs, S. F. No. 325,368. Dated Sept. 1, 1885. This invention relates to spinning machines for fibrous material of different kinds, but specially adapted for spinning hemp, whether Manila, Sisal, Kentucky, Russia or other forms of hemp. The object of the invention is to effect economy in power and space, and to secure a machine capable of doing increased work.

BORING MACHINE.—John B. Cobb, College City, Cal. No. 324,920. Dated August 25, 1885. This drilling apparatus consists of a rotating frame, around the periphery of which a number of shanks for drills of different sizes are journaled, a gearing or mechanism by which these drills are operated, and a means for bringing any drill into action and throwing others out, together with a feed mechanism.

MILL-STOCK FEEDER.—George Downie and Albert F. Eisan, Marysville. No. 325,327. Dated Sept. 1, 1885. This invention relates to that class of feeders which are adapted to properly direct or feed what is known as "mill-stock" to any suitable machine underneath—such as rolls or a purifier; and the machine consists of a combination of devices. The object is to provide a simple and effective feeder of this class adapted to automatically feed the stuff in a uniform and steady stream.

ROAD LEVELER.—Stillman A. Moulton, San Jose, No. 325,354. Dated Sept. 1, 1885. This road-leveling device is adapted to be attached to any wagon, cart or other wheeled frame, but especially to watering or sprinkling carts. It consists in a scraper head carrying a series of spring teeth or scrapers adjustably suspended from the wheeled frame either before or behind the wheels, said scraper head being so constructed as to be enabled to bend at its middle to an angle in a horizontal or in a vertical plane. There are peculiar runners connected with the wheeled frame and with the scraper head, which may or may not be used as desired.

Inducements to Subscribers.

To favor subscribers to this paper, and to induce new patrons to try our publication, we offer the following advantages to all new subscribers who pay one year in advance, or present subscribers who will pay their subscription up to a date fully one year in advance of the present time. We will furnish the following articles (while this notice continues), at the reduced rates named, viz.:

1. World's Encyclopedia, 794 pages, with 1,200 illustrations, worth \$1.75. Postpaid for 50 cts.
2. Patent Binder (cloth cover) with name of this paper in gilt. Postpaid for 50 cts. \$1.00
3. To NEW SUBSCRIBERS, 12 select back Nos. of the MINING AND SCIENTIFIC PRESS.—Free .75
4. Any of Harper's first-class periodicals, 15 per cent less than regular rates.
5. Frank Leslie's and most other U. S. periodicals, 15 per cent discount from regular rates.
6. Pacific Coast and Eastern Bibles, Books and Periodicals, except special publications, we can usually give 10 to 15 per cent less than advertised retail rates.
7. Picturesque Arizona, 380 pages, in cloth and gilt. Postpaid for 25 cts. 1.25
8. Californian, 100 pages, Magazine, 1880 to 1882 (3 Vols.) single Nos. Postpaid for 3 cts. .35
Per volume, unbound, 5 Vols. Postpaid for 20 cts. 2.00
Per volume, bound, cloth back and stiff paper sides. Postpaid for 40 cts. 2.50
9. Picturesque California Homes (40 building plans and estimates). Postpaid for \$1 3.50
10. Dewey's Patent Newspaper File Holder (18 to 36 inch). 25 cts. .50

NOTE.—The cash must accompany all orders. If too much is sent for any article or publication, the balance will be returned immediately. Address this office, No. 252 Market St., S. F.

1885.—No. 11 is really a valuable premium to new-comers and others who appreciate the better class of stories and a good standard of California literature.

- Webster's Dictionary, 634 pages, with 1,500 illustrations. 50 cts. 1.50
Grant Lithograph, size 24x19. 50 cts. .50
Cleveland Fine Steel Plate, size 12x16. 10 cts. .50
Grant Steel Plate, cabinet size. 5 cts.
De Groot's History of Mining in California. 5 cts. .25
Beautiful Poetic Review, a handsome, entertaining and instructive souvenir of real merit. 25 cts. .50

Send for any further information desired. Readers will please inform their new neighbors and others concerning our paper and these offerings. On application, sample copies of this paper will be mailed free to the address of any persons thought likely to subscribe.

To Young Men and Young Women.

All intelligent boys and girls should prepare themselves for usefulness in business if they wish to "step up higher." We have for sale to such, on easy and favorable terms, a scholarship in one of the best business colleges in the U. S. Address this office.

DRY WASHER for PLACERS

THE HITCHCOCK & HERSHEY
Dry-Placer Gold Concentrator.

This Machine weighs only 325 pounds; readily taken apart; packs in small compass; may be run by hand or horse power. Capacity, two tons an hour. No blowers or fans. No quicksilver used. Frame of malleable iron. Will save a higher percentage of gold than other machines.

Now on exhibition at Mechanics' Fair, San Francisco, where it may be seen in operation.

W. E. CHAMBERLAIN, JR. T. A. ROBINSON.

Returned to new building, former location, 320 Post street, where students have all the advantages of elegant halls, new furniture, first-class facilities, and a full corps of experienced teachers.

LIFE SCHOLARSHIPS.....\$75.

Ladies admitted into all departments. Day and Evening Sessions during the entire year.

EUCALYPTUS
Boiler Scale Preventive and Remover.

This Preparation is now in use in many thousands of Steamship and Stationary Boilers all over the World, and has always driven other Scale Removers out of the Market when they have come into Competition.

WHAT IS SAID OF IT.

U. S. NAVY.

"In the surveying cruise of this vessel previous to this, similar in all respects, I found it necessary at times to scale the boilers. The use of Eucalyptus has obviated this necessity." "The use of Eucalyptus has been proved to protect the iron of the boilers from corrosion."—Report of Chief Engineer U. S. S. Ranger.

P. C. S. S. Co.

"I have used many kinds of scale removers, and never found anything that could do as thorough work as yours does. What we have used has paid for itself many times over in the saving in boiler repairs alone." JOHN COSGROVE, Supt. Eng'r P. C. S. S. Co.

O. & O. S. S. Co.

"I hope never to be without it."—T. Tomlinson, Chief Eng'r S. S. Arabia.

JOHN ROACH & SONS, N. Y.

"Your preparation is perfect in its working and a complete success in all things for which it is intended." P. DORRIS, Supt. Forging Dept. Morgan Iron Works.

FULTON FOUNDRY.

"We find it to be the best in use for removing scale."—H. P. Christie, Supt.

STARR'S MILLS.

"It is a success, and we advise and endorse its use strongly."—Starr & Co., per A. D. Starr.

BUCKEYE MILL, MARYSVILLE.

"We have never in our experience of 15 years found anything to equal it."—Buckeye Mill Co., per Justus Greeley.

GIANT POWDER WORKS.

"I cheerfully add my testimonial to the many given already in regard to the efficacy of your scale remover." FRANK ROLLER, Supt.

U. S. MINT.

"I take pleasure in recommending it as the best and cheapest thing I have used." GEO. L. HARRIS, Chief Eng'r U. S. Mint.

HOOD'S FOUNDRY COKE.

Consumers are respectfully informed that owing to inferior brands of Coke having been sold
 in this and other countries under the name of "Patent Coke," the Glamorgan Coal Co.
 (Limited), Cardiff, in May, 1884, abandoned the title of "Patent Foundry Coke," substituting
 that of "Hood's Foundry Coke."

This Coke is exclusively used by the Selby Smelting and Lead Co., Union Iron Works,
 Professor Thomas Price, and other consumers here. Large quantities are regularly forwarded
 to Copper Smelters in Arizona and New Mexico, and also to consumers in Nevada and Salt Lake.

The undersigned are the SOLE IMPORTERS of the above Coke, which is for sale in quanti-
 ties to suit purchasers.

BALFOUR, GUTHRIE & CO.,
 316 California St., San Francisco.

HEINE PATENT SAFETY BOILER.

RISDON IRON AND LOCOMOTIVE WORKS.

Sole Agents for the Pacific Coast, Corner Beale and Howard Sts., San Francisco.

FIRST PREMIUM AWARDED at MECHANICS' FAIR, 1884.

Economy in space and fuel. Safety at high
 pressures. Freedom from scaling. Equally
 adapted for power and heating purposes.
 Especially adapted for mills, factories, hotels,
 stores or any place where safety is a necessity.
 Will work well with muddy water and any kind
 of fuel.

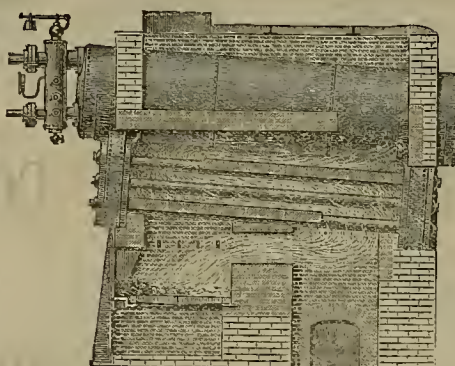

TESTIMONIALS.

SAN FRANCISCO, Sept. 19, 1884.

Risdon Iron and Locomotive Works—Gentle-
 men: We have had one of your Heine Patent
 Safety Boilers in use for four months at our
 Borax Works, in Alameda. It does good work
 and gives perfect satisfaction. Yours truly,
 (Signed) WM. T. COLEMAN & CO.

SAN FRANCISCO, Oct. 4, 1884.

Risdon Iron and Locomotive Works—Dear
 Sirs: I am using one of your Heine Patent
 Safety Boilers in my Candy Factory on Twenty-
 Third street, near Valencia. For economy of
 fuel, safety and efficiency I have never seen its
 equal. Very truly yours,
 (Signed) W. S. TOWNSEND.

Send for Circular and Prices.

F. A. HUNTINGTON'S CENTRIFUGAL ROLLER QUARTZ MILL.

Economy in Expense of Plant. Economy in Cost of Working. Economy
 in Saving Gold. Economy in Transportation of Machinery.

Economy in Cost of Erection of Mill at Mine. Econo-
 my in Time Required to Establish Plant
 (one day only being consumed).

The Huntington Mill has passed entirely through the experimental stage. Two years of
 continuous use at a number of mines in California has enabled the inventor to perfect and im-
 prove the machinery until he feels justified in assuring the public that he has reached THE ABSO-
 LUTE in the construction of a perfect Quartz Mill.

 INVENTORS on the Pacific Coast will find it greatly to their advantage to consult this old, experienced, first-class
 Agency. We have able and trustworthy Associates and Agents in Washington and the capital cities of the principal
 nations of the world. In connection with our editorial, scientific and Patent Law Library, and record of original
 cases in our office, we have other advantages far beyond those which can be offered home inventors by other agencies.
 The information accumulated through long and careful practice before the Office, and the frequent examination of
 Patents already granted, for the purpose of determining the patentability of inventions brought before us, enabled
 us often to give advice which will save inventors the expense of applying for Patents upon inventions which are not
 few. Circulars of advice sent free on receipt of postage. Address DEWEY & CO., Patent Agents, 262 Market St., S. F.

PLANTS FOR GOLD AND SILVER MILLS, embracing machinery of LATEST DESIGN and MOST IMPROVED construction. We offer our customers the BEST RESULTS OF 35 YEARS' EXPERIENCE in this SPECIAL LINE of work, and are PREPARED to furnish from SAN FRANCISCO or CHICAGO, the MOST APPROVED character of MINING AND REDUCTION MACHINERY, adapted to all grades of ores and SUPERIOR to that of any other make, at the LOWEST POSSIBLE PRICES.

We are also prepared to CONSTRUCT and DELIVER in COMPLETE RUNNING ORDER, in any locality, MILLS, CONCENTRATION WORKS, WATER JACKET SMELTING FURNACES, HOISTING WORKS, PUMPING MACHINERY, ETC., ETC., of any DESIRED CAPACITY.

WATER JACKET SMELTING FURNACES

For COPPER and ARGENTIFEROUS LEAD ores of NEW and ORIGINAL DESIGNS, covered by LETTERS PATENT. No other Furnace CAN COMPARE with these for DURABILITY, and in CAPACITY for uninterrupted work. MORE THAN 150 of them are now RUNNING in various parts of THIS COUNTRY, as well as many in FOREIGN COUNTRIES, giving results NEVER BEFORE ATTAINED as regards CONTINUOUS running, ECONOMY of fuel, AMOUNT and QUALITY of BULLION produced. These CLAIMS have been PROVEN BY RESULTS in ANY NUMBER of INSTANCES, and the GREAT SUPERIORITY of this SYSTEM of smelting, was DEMONSTRATED BEYOND QUESTION. COMPLETE PLANTS furnished in order of any CAPACITY, with ALL IMPROVEMENTS that experience has DEMONSTRATED as VALUABLE in this class of work.

Beyond question the cheapest and most effective machine of the kind now in use adapted to all grades and classes of ores.

This machine has been THOROUGHLY TESTED for the past TWO YEARS, under a GREAT VARIETY of CONDITIONS, giving most EXTRAORDINARY results FAR IN ADVANCE of anything EVER BEFORE REALIZED. A recent COMPETITIVE TEST at the Carlisle Mine in Mexico, showed an ADVANTAGE OF OVER 30 PER CENT in favor of THE DUNCAN. The amount SAVED OVER THE TRUE being sufficient to PAY THE ENTIRE COST of the machines EVERY MONTH OF THE YEAR. One of its MOST VALUABLE features is as an AMALGAMATOR. It saves all THE AMALGAM GOLD and SILVER that ESCAPES the BATTERIES, PANS or SETTLERS, making the machine worth MORE than ITS COST for THIS PURPOSE ALONE.

Baker's Mining Horse Power.

Possessing all the requirements of a first-class hoist, and affording means for the continuous operation of a Pump or Blower, without interfering with a hoisting apparatus. It is made entirely of iron, no piece weighs over 300 pounds. At the ordinary speed of a horse, a 1,000-pound bucket of ore may be raised 120 feet per minute. The hoisting-drum is under the complete control of the man of the shaft, and is capable of carrying 500 feet of five-eighths steel rope. SEND FOR CIRCULAR.

\$1,000 CHALLENGE!

**THE FRUE ORE CONCENTRATOR,
OR VANNING MACHINE.**

PRICE: FIVE HUNDRED AND SEVENTY-FIVE DOLLARS,
(\$575 00), F. O. B.

OVER 1,000 ARE NOW IN USE. Saves from 40 to 100 per cent more than any other Concentrator. Concentrations are clean from the first working. The wear and tear are merely nominal. A machine can be seen in working order and ready to make tests at the Fulton Iron Works, No. 220 Fremont Street, San Francisco.

As the result of a suit East against an End Shake Machine (the Embrey), similar to the Triumph, the Frue Vanning Machine Company owns the Embrey patent, and can put in the market an End Shake Machine of earlier patent that will do as good work as the Triumph, and superior in construction and durability. There will be no risk of suit for infringement.

The Frue Vanning Machine Company warn the public that they claim and will prove the Triumph machine to be an infringement on patents owned by them.

Protected by patents May 4, 1869, Dec. 22 1874, Sept. 2, 1879, April 27, 1880, March 22, 1881, Feb. 20, 1883, Sept. 18, 1883. Patents applied for.

N. B.—We are and have been ready at any time to make a competitive trial against the Triumph, or any other Concentrator for stakes of \$1,000.

ADAMS & CARTER, Agents Frue Vanning Machine Co.,

Room 7—No. 109 California Street,

SAN FRANCISCO, CAL.

\$1,000 CHALLENGE ACCEPTED!

PRICE, FIVE HUNDRED AND FIFTY DOLLARS
(\$550.00), F. O. B.

THE "TRIUMPH" TRIUMPHANT!

**THE
"TRIUMPH" ORE CONCENTRATOR.**

In a competitive trial recently had between two of the "Triumph" Ore Concentrators and the same number of "Frue" Vanning Machines, at the mill of the celebrated gold producing Original Empire Mill and Mining Company, in Grass Valley, Nevada County, Cal., the "Triumphs" produced thirteen and fifteen one-hundredths (13.15) per cent more concentrations than did the "Frue" Vanners, during a run of twenty-four consecutive days, or a net gold coin result of \$193.15, or \$9.30 per day, in favor of the two "Triumph" Concentrators.

These returns do not include the value of the amalgam saved by the "Triumphs" during the test; which will add to the net gain. The form of construction of the feed bowl is such that considerable amalgam is necessarily saved, which is lost on the "Frue" Vanners.

This trial was conducted under the personal supervision of the Manager and Superintendent of that Company, in a strictly fair and impartial manner, and with the sole view of determining, in the interest of that Company, the merits and demerits of the respective machines by a thoroughly practical test. A relation of the course of procedure, a concise analysis of assays, and a tabulated statement of the net bullion results, with accurate deductions therefrom, will soon be published in Circular form.

The superiority of the present construction of the "Triumph" over the form originally introduced, together with the demonstrated results of the above, and other trials had with the "Frue" Vanners, induce us to and we hereby accept the Challenge of \$1,000, flaunted by the Agents of the "Frue Vanning Machine Company," and hold ourselves in readiness to enter into a second competitive trial for that sum, at such place and upon such terms and conditions as may hereafter be mutually arranged.

We guarantee purchasers against all costs, expenses or charges incurred by reason of any infringements of any existing patents.

"Put up or shut up," and "Let the Best Machine win!"

MINING AND SCIENTIFIC PRESS.

An Illustrated Journal of Mining, Popular Science and General News.

BY DEWEY & CO.,
Publishers.

SAN FRANCISCO, SATURDAY, SEPTEMBER 19, 1885.

VOLUME LI
Number 12

Bed-Rock.

In California bed-rock is commonly slate, shale or schist, but sometimes it is granite or sandstone, and more rarely limestones. The slates, etc., are of various colors (brown, blue, green or black), and are usually soft (talcoose or chloritic), but in fine grained silicious blue or black slate also occurs, which is rather hard. The granite is soft and decomposed, and slacks rapidly on exposure. In Oregon, Colorado and Montana similar rocks occur, according to Williams in his "Placer Mines and Mining Ditches."

In Idaho the common bed-rock is a highly decomposed granite, which is firm when first uncovered, but soon disintegrates on exposure to the air. In Dakota slate prevails, as also granite and sandstone. In the southern gold belt of Georgia, North Carolina and South Carolina the bed-rock is usually a soft, decomposed mica schist, which is highly silicious, and often contains stringers of quartz, though a hard slate is also met with. In this portion of the country the "bed-rock" itself is mined. The disintegration of the surface by decomposition and weathering gives rise to a loose material which may be "hydraulicked," but which is not usually of the same character as the western gravel deposits, the latter often occurring at considerable distance from their origin.

The form of the surface of the bed-rock is a matter of considerable importance in working. A rough, uneven bed increases the labor of cleaning up, and if very irregular may suddenly leave the sluices "out of grade" at points where the pay is richest. In drift mines operations are facilitated by a regularity in the formation, while the drainage and extraction of ore are obstructed by a reverse condition.

Strata of indurated clay, or of dead gravel cement, occur frequently in gravel deposits, forming what are known as false bed-rocks. Sometimes it happens that below such a stratum the deposit, consisting of "dead wash," is too poor to pay for washing, or that the grade will not admit of deeper working; in such cases the seam is treated as a working bed-rock, and the tougher and more uniform it is the better. A number of profitable mines are operated on this plan, working off only the top pay streak down to a false bed-rock; but in more numerous cases, where it is desirable to "bottom" the entire deposit for the sake of winning the richer gravel on the true bed-rock and the gold lying in the crevices of the latter, the occurrence of the false bed-rocks is a great hindrance. Some clays are so tenacious as to yield but slowly to the pipe, and often blasting has to be resorted to, thus increasing the expense.

On the whole the lead situation still remains very strong, and its apparent offish flurry must soon be checked by the demand, for the Horn Silver Company is producing nothing, and that is a loss of at least 1000 tons per month, which, so far as we can learn, is not being made up in any other locality, and during no year since 1870 has our annual consumption been 12,000 tons less than our production.

The mines down at Hiko are reported to be improving greatly. That 150-foot (in width) ledge, of which the public heard so much, has entirely evaporated, and in its stead there is a seven-foot ledge of good grade ore. The company's indebtedness is light and everything now promises well at the mines in Pahrangat.

Silver in Oregon.

Oregon has never been noted as a silver region, and in fact, compared with other Pacific Coast States her gold mining industry even has been unimportant. Still there are many good gold mining places within her borders. Now, however, the State is coming into the ranks of silver producers. From Granite Creek, the other day, 500 ounces of silver were shipped from the mine of J. B. Cavel. It has been known for some time that the mountains of Granite Creek abounded in rich mineral, but for some reason or other no great stir has been created regarding them, the owners seemingly contented to "pursue the even tenor of their way" without molestation. The different owners of the ledges discovered have from time to time erected small mills and arrastras for the

Proper Land District for Mines.

A decision has been rendered by the Commissioner of the General Land Office, on a California mining case, to the effect that where a party commences proceedings for mining patent on unsurveyed land in a certain land office, under the erroneous belief that such claim is within that land district, he must, on discovering his mistake, commence *de novo* before the proper local office. It seems that a man filed an application in the Shasta land district for a placer claim which was $1\frac{1}{2}$ miles from the district line, and carried on all his legal proceedings in that district, as, the land being unsurveyed he thought his claim was within the Shasta district, and did not learn it was in the Humboldt land district, until after the township survey had been made. He then requested

F. A. HUNTINGTON'S IMPROVED ORE CRUSHER.

working of their ore, and other than that they were making fair wages, the full extent of the richness of the mines was never given to the public. These mines are in a spur of the Blue mountains.

Last week the returns from assays of ore from the Wallowa mountain were received, the croppings of the leads showing from \$20 to \$75 per ton in silver. The Wallowa *Chieftain*, published at Joseph, Oregon, says that a private assay of ore taken a few feet from the surface of one of the galena ledges by an experienced miner gave \$400 silver to the ton. There are two kinds of ore found here, one bearing lead and silver and the other copper and silver; some of them carrying 50 per cent lead and others 75 per cent copper. There are 19 claims already recorded and at least 150 more located. The prospecting in general has been done by inexperienced miners and they have located everything that looked like a ledge, and a great many veins of quartzite. The ledges are from two feet to fifty feet in thickness and are found on several distinct mountains. All that is needed now is capital to develop these mines.

CHLORIDES in El Dorado canyon recently shipped ore clear to Pueblo, Col., for reduction. The ore is boated down the Colorado river to the Needles, thence shipped by rail to the reduction works.

that he be allowed, under the circumstances, to make the entry at the Shasta district office.

The Commissioner of the Land Office calls attention to the fact that Section 2325, Revised Statutes, clearly sets forth the manner of proceeding to obtain patent to a mining claim; one of the statutory requirements is that the application for patent shall be filed in the "proper land office" that notices of the application shall be posted in such land office, and that the Register of such office shall publish a notice that such application has been made, etc.

The Commissioner decides as follows: "In the case under consideration it is manifest that the statute has not been complied with; therefore, in view of this fact, Mr. Jacobs could not be allowed to make an entry or receive patent upon his present application, which, as stated, has not been filed in the proper land office, as required. Applicant's proper course to obtain patent will be to file his application for patent in the proper land office, and commence proceedings *de novo*, subject, of course, to any prior valid appropriation of the land."

OWING to the depression in the silver mining industry the newspaper business is evidently on the wane in Nevada. Of the fifteen counties in the State, only thirteen are represented by newspapers, and six by only one each. The counties unrepresented are Churchill and Roop.

A New Ore Crusher.

Mr. Frank A. Huntington, of this city, has just received through the MINING AND SCIENTIFIC PRESS Patent Agency a patent on his improved rock-breaker, an engraving of which is shown on this page. Although the patent has just been issued, Mr. Huntington has been manufacturing these machines and selling them with his centrifugal roller mills, for breaking the ore before feeding it to said mills.

There are but two working parts to this crusher, viz., the eccentric shaft J and the cylindrical jaw N, through which the shaft J passes loosely. And by rotating the shaft J, the jaw N is moved to and from the stationary jaw F, crushing the ore between these two points, the same as in the ordinary jaw crusher. When crushing, the jaw N moves slowly around in the opposite direction to the eccentric shaft J, thereby causing an even wear around the whole surface of the jaw N, which has ten times the wearing surface of those used in the ordinary crusher. This slow rotating movement also materially assists the discharge of wet ores. By dropping plates L between the bar D and jaw F, the ore can be crushed to any desired fineness. The wrought-iron bands E pass around the bearing of the eccentric shaft J, and the bolts C and D take all the strain from the cast-iron sides, thus enabling it to be made light and strong.

The special claims of excellence for this machine made by the inventor are: the few working parts; the large wearing surface of the jaw N; the easy adjustment of the machine to crush coarse or fine; the free discharge of wet ore; the entire absence in the working parts of bolts, toggles, eccentric straps, rods, rubber springs, and numerous other complicated devices, which are a source of annoyances and expense in the ordinary jaw crusher.

There is a lug or projection at the upper side of the shoe, which prevents rock from being forced outward, when the cylinder approaches the shoe, the rock being held beneath this projection until it can be acted on and crushed by the movement of the cylinder. As the cylinder or its interior bushing turns loosely upon the shaft, it will be seen that the action of the cylinder will simply be to approach and recede from the fixed jaw without partaking of the revolving movement of the shaft.

There will be, however, a slight forward movement of the cylinder in the direction of the rotation of the shaft at each forward and backward movement with rotation to the die, so that the cylinder always presents a new force to act against the rock between the two, and will gradually complete the revolution.

Three sizes of these crushers are made weighing respectively 850, 1900 and 2700 pounds.

SALT AND BORAX IN NEVADA.—There are now being shipped to various points monthly, over the Carson & Colorado Railroad, some 400 tons of rock and table salt, and about 250 tons of borax. The salt is equal to the very best Liverpool salt. These minerals are found in nearly a pure state in many places. In some borax marshes the native borax (called tinkle) and borate of lime has to be mixed with carbonate of soda brought from soda flats to make the merchantable borax. In other places nature has made the necessary mixture herself. Boiling and evaporating pans and tanks are used. Sagebrush is the fuel, and Indian labor is employed.

CORRESPONDENCE.

We admit, unendorsed, opinions of correspondents.—Eds.

A Little Mining Philosophy.

[Written for the Press.]

Never build a mill before you have a mine; that has been the Eastern fashion and has not been a success.

Never buy complicated machinery when you can get simple machinery to do the same amount of work.

Never base your calculations on the assay of a specimen.

In taking down ore take it down clean as possible. If impossible to take down clean have it assorted on top. It costs as much to mill a ton of waste as it does a ton of ore. The same rule holds good in regard to smelting ore.

In taking down ore for shipment assort down as fine as possible. It will reduce the quantity and will improve the quality, giving the shipper a greater profit.

Keep cars, track and chutes in good repair. It saves time, money, waste of ore and bad language.

Keep plenty of drifting tools and picks on hand. See they are kept in good repair. There is nothing so exasperates the miner and is less profitable to the mine owner than a miner working dull steel.

Always buy the best quality of powder, fuse, caps, etc. It pays the best, does more work, and lessens the amount of danger in use.

Keep hanging ground secured in proper shape. Miners working where they think there is any danger will be in their places as little as possible.

See that shaft timbers are put in in proper shape and correctly in line so that in working the levels there will be less danger of an accident.

Work as many miners as can profitably be worked below and as few others as can be got along with on top. T. R. MORGAN.

Park City, Utah.

Formation of Mineral Veins.

EDITORS PRESS:—I mail to you herewith a ferrotype plate beautifully veined with metallic silver, which may bear some relation to the mineral veins and deposits in the earth's crust.

This accidental discovery in photography was made some years ago when overhauling a lot of old dirty "tin-type" plates, and is the most beautiful specimen of the kind I have ever seen.

It is unnecessary to refer to photography any further than to say that before "taking" the picture the plate is coated with a silver salt solution, and too long delay before an exposure is made results in injury to the sensitized surface, hence the plate is cast aside unused. It is quite common to find such old plates with mottled silver veins along the edges where the iron has rusted and the asphalt has separated from the iron. And the only way that I can account for this plate being completely veined is that one with a rusty back may have lain on top of it, and the iron rust may have had the effect of transforming the silver salt to metallic silver and drawn it into veins. Now that the foundation has been laid, the building up of veins is very simple. A process commonly used in photography for intensifying weak negatives is to flow over the negative a silver salt solution, to which a reducing agent (proto sulphate of iron) in solution has been added immediately previous to the operation. This solution is kept in motion over the surface of the plate, and where the heaviest deposits already exist there is the most attraction, hence there the proportion of deposit will be greatest.

Seeing that the affinity of metals is sufficiently strong to produce the results described above, we do not consider it unreasonable to suppose that at any time during the earth's formation, after it had commenced to crust over, the metals were drawn into veins by their own affinity, and as other volumes of matter were subsequently precipitated on the surface and flowed to and fro either in an igneous or aqueous solution, the mineral continued to build up the veins so long as mineral existed in the clouds of chaotic matter that fell on mother earth. And even as the clouds of vapor hover around the mountain crests to-day, so may we suppose the clouds of chaotic matter most rich in mineral were drawn by affinity to shower down their metallic burdens in the region of former deposits.

Mineral veins formed in this way could, of course, be larger where the proportion of mineral was greatest in the matter precipitated, and as the proportion decreased the vein would "pinch up," unless some other matter for which the metal had an affinity should fill the place with gangue.

We may also suppose that a stream or wave of matter (bearing mineral) flowing continually southward over a north and south vein, would have a tendency to draw the "chimneys" toward the north, etc.; or flowing from east to west over a north and south vein, the vein must "dip" to the west as the trend of the chimney in its downward course would be to the south. Of course upheavals by earthquakes must be taken into consideration here.

In examining the plate which we lend you

we may learn something of the relation that one vein bears to another. The heaviest ones we see tend to lie across the "belt," and where main veins lie close together and nearly parallel no spurs exist between them, while spurs do exist in the direction of vacant fields, also largest veins are more isolated from other deposits.

Probably there is no field on which science has thrown so little light as that of mining, and though, as Von Cotta says, "no one theory will apply to all mineral deposits," yet we trust that some day science may so guide us in extracting the precious metals from the bowels of the earth that we will not "put more money in the ground than we take out."

In sending you this plate it is with the hope that it may engage the attention of men of science as well as prospectors, for although the latter occupation has engaged the writer for the past ten years, yet he acknowledges his ignorance of geology and mineralogy and can only give hints on the supposed value of this accidental discovery, which may disprove the popular theory that "where a pocket exists there's more below."

HENRY W. BROWN.

Glendale, Montana, Sept. 5th.

Nevada Coal.

Some years ago Professor W. Frank Stewart, the deceased scientist, published in one of the journals of this city an article headed "No Coal in the Sagebrush." It was intended to demonstrate by scientific facts and observation that this was no coal country, and its geological composition was such that no coal existed in it and need not be looked for. He was right to a certain extent, yet he was not until afterward conversant with the fact that coal had actually been found at a few points, yet not in paying quantity or quality. Some of the earliest prospectors after silver and gold ledges found quite a large deposit of an inferior quality of coal in El Dorado canyon, a few miles east of Dayton, and a large amount of money was expended in the attempt to develop it, but in its deepest explorations no real coal suitable for mechanical or domestic use was found. Several tons were hauled to this city and put to practical use, but either in cooking ranges or under steam boilers it was found deficient in its natural heating properties; in fact, it cost too much for wood to make it burn good; therefore, it never came into general use. Other coal mines of a similar nature were opened in that vicinity with like result, and over beyond Como, in Whitman District, small veins of a better quality were found and explored, and the "Whitman coal mines" are to be found laid down on some of the earliest maps. But both quantity and quality were lacking.

In 1864-5 extensive deposits of coal or ignite were opened and explored near Crystal Peak, some miles above Reno, where the Truckee passes out of the mountains. Some beds were several feet thick, but led to nothing better than bituminous shale. It would burn, but gave too little heat. The best vein was found in Dog Valley creek. It was 2 or 3 inches wide where it first appeared on the bank of the creek, and laid almost flat. About 50 feet further south a shaft was sunk 28 feet, intersecting the vein. Here the writer of this, with a pick, cut out a slab of the coal two feet long by a foot wide, and about eight inches thick, which was the full thickness of the vein. It was subsequently brought to this city and put on exhibition at the office of the Crystal Peak Coal Company. More coal was taken from the bottom of this shaft, and J. W. Hemenway, a well-known blacksmith of this city, took some of it to a forge in the town of Crystal Peak and tested it by welding a couple of bars of iron together, making a good and successful weld. It was of excellent quality—better than that now in common use which comes from Wyoming, but all the explorations of the company failed to develop a paying deposit of it, or any greater thickness of vein than we have described, and the coal boom gradually subsided into nothingness.

It is now stated that a good-sized vein of excellent coal is being opened in Pittsburg district, near Lewis, in the Reese River section, by Hon. L. W. Gitchell and others. It is said to be an old location re-opened, and more practically explored than at first. It most certainly is to be hoped that they may meet with full and complete success, and develop what would be more valuable than an ordinary silver mine at this point—a genuine coal mine in the sagebrush.—*Virginia Enterprise.*

THE statement of the Canadian Pacific Railroad shows the gross earnings for July to be \$908,000; net earnings, \$446,000; increase in net earnings, \$291,000 over the corresponding month of last year.

THERE is a natural bridge near the boundary line between Arizona and New Mexico, 20 miles north of the Atlantic and Pacific Railroad, which surpasses in every way the famous one in Virginia.

PEOPLE from Elko, Nev., say that time is improving at that place, and that business of all kinds is better than it has been for several seasons.

STRONG protests are being made in Mexico against the practice of selling vast tracts of land to foreigners.

The Overland Monthly.

Abandoned Mining Towns.

This favorite California magazine for September came out promptly on time, and a capital number it is, being brimful of choice reading, the most of it relating to California themes and adapted to California tastes and modes of thought. As being best suited to the columns of this journal we reproduce portions of an article from the pen of Dr. Henry Degroot, entitled "You Bet," being a description of one of the many mining towns of California now in a state of decadence, not a few of them having disappeared altogether.

You Bet.

How still it is; how little stir; how devoid of life these crater-like basins, with their rocky bottoms and their steep walls of red earth, where once stood the busy town of You Bet. We know it was You Bet because the name still adheres to the few buildings left on the bluff that divides these basins, and because there are traditions of its once having stood here. It is, or rather was, one of a series of hamlets standing over the "dead rivers" that traverse the several divides between the North Fork, Bear river, Steep Hollow, and Greenhorn Canyon, being the central one of the group. Looking south, it has Little York and Gold Run on that side, with Red Dog and Gouge Eye, now Hunt's Hill, on the other; the most widely separated of these places, measuring in a straight line, being not over six miles apart. Following the wagon road, however, in its windings along the sides of the intervening canyons, the distance is more than twice that much. As has You Bet, so have its neighbors nearly all disappeared, some of them having suffered total extinction, and this at the hands of the very men who built and named, and who once occupied and owned them. As the miners founded, so did the miners destroy, these ancient towns—the drinking saloon, in obedience to the doctrine of the "survival of the fittest," having almost always been the last to succumb.

From the Central Pacific Railroad, a little below Dutch Flat, looking east, three or four buildings can be seen two miles off that way, strongly outlined, being perched on the crest of a high ridge, with a precipitous face on the west. This is all that remains of You Bet. The buildings here left consist of a store, a lodging house, a butcher's shop and a drinking saloon, all modern structures, the old town having stood where now yawns a great hydraulic pit more than 200 feet deep. The house that hangs half way over the abyss, liable to tumble into it at any moment, is not occupied at present, because the last habitation so situated, when it went over the brink, was badly damaged by the descent; moreover, one of the occupants was killed.

Not at all pleasant is it to sit as I do, in this grove of young pines, and look out over the field of desolation so spread out around me; the less so that it was my lot to have been one of the great army of diggers, who, many years ago, toiled and suffered in the placere here, than which few richer were ever found in the State. Then and now! How hardly can one realize that such changes could have taken place in the comparative short period of 30 years! From a solitude to a hive of roaring industry, and back again to a solitude, with only the far-off blue mountains, the beautiful wilderness around, and the rivers rolling as they did of yore. And that active, energetic army of toilers—where are they? For, of a certainty, very few of them are to be seen here or whereabouts any more. I declare to you, Mr. Editor, that, looking out from this eminence, out over these basins, with their billowy heaps of boulders glistening in the sun, and the whole vast panorama in view, I cannot now discern a single human being. It is a strange disappearance! But I know where some of them are, and will tell you a little further on; for, anticipating what thought is uppermost in the mind of the reader, I may as well stop here, and make for these uncouth names such apology as best I can, since it must be admitted that some of them are decidedly odd, and, in a few instances, even carry about them an odor of vulgarity.

In the first place, then, it may be observed that the naming of towns and other localities was in these early days generally the result of some unimportant incident or mere chance, and, being often the work of an individual or company, did not represent the views or wishes of the community at large, who were not at all likely to be consulted in the premises. Some miner, perhaps a rough fellow, would, by reason of some trivial event, or freak of fancy, give a name to a place; and, no one taking any interest in the matter, it would be suffered to stand, even though without significance, propriety or even decency; for it may be observed that the names of the towns above mentioned are respectable and even classical compared with some that could once be found on the map of California—if, to be sure, that would help our case any. As will be seen, too, some amendment in this particular is going on, Hunt's Hill having supplanted Gouge Eye, as some better name might also come to supplant Red Dog and You Bet, were not these towns already so near death's door.

Though of unpolished exterior, and sometimes a little boisterous in their convivialities, these pioneer miners were not, as a class, men

of depraved tastes or vicious habits. This would, in fact, be inferred from what Bret Harte has told us about them in his story of "The Outcasts of Poker Flat." We have it to the authority of the great humorist, that the inhabitants of that camp arose as one man and drove the gamblers and other ungodly characters out of the place, threatening them with dire punishment should they dare to return. What more could the most puritanic church-goer, or even the witch-burners, in their day, have done than this? And is it to be supposed that the denizens of Red Dog, You Bet, and Gouge Eye were less zealous in the cause of evangelical religion and good morals than these Poker-Flaters? We should say not. And although the writer cannot vouch for the fact, it is to be presumed that these good people, in the absence of theaters, prize fights, and horse races, and having no facilities for picnics and balls, did every Sabbath attend regular preaching, and encourage by their presence the edifying Sunday-school and the unctuous prayer-meeting. If the writer cannot recall these precious occasions, it does not follow that they did occur; and if the days of such unregenerate person have been extended beyond those vouchsafed these devout people, such preservation is not to be attributed to his superior piety, but rather, perhaps, to the antiseptic properties of sin.

But dismissing this subject of religion and morals, let me redeem now my promise to tell you where some of the men who took part in the stirring scenes here once enacted are now to be found. Over against the knoll where I sit is another, of gentle acclivity, and like this covered with a growth of thrifty young pines. There on that knoll is the ancient necropolis of You Bet, and the camps around, and there within its precincts have been gathered many of the inhabitants of these pioneer towns. Though the hues of ruin have crept over the place, the ground itself, as is almost everywhere the case with these old graveyards, remains intact. You will say it is to the credit of the miners that these homes of the dead have been so generally respected. Not especially so. In looking for a spot for sepulture, the early miner was apt to select some rocky ridge or knoll which stood apart from the diggings and which, being supposed to contain little or no gold, he had reason to think would never be disturbed. Had it ever been found that they contained pay dirt, these consecrated grounds would have been attacked and run off to bedrock long ago.

But, while the land has been spared by the remorseless gold-seeker, time has not been equally lenient with the tombs themselves, which, with no one to care for them, have, during these long years, been slowly yielding to decay. The place presents, in fact, a sadly neglected appearance. The most of the low mounds have been leveled with the earth; the palings about them have fallen off, and the exterior inclosure is nearly all gone. The head boards, where any are left, lean at all angles, or have tumbled to the ground, so bleached and weathered that the inscriptions upon them can no longer be deciphered; but it matters not, for few will ever come seeking to read or replace them. Nor does it matter that the wild vines and the brambles grow thick over these graves. They who tenant them are mostly forgotten now. There were those who, years ago, thought of them perpetually, and longed for their presence in their old homes. But they wished and waited in vain, for neither the lost ones nor note nor tidings of them came, or ever will come, any more. The names of more than a few who sleep in this field of graves we do not know, nor whence they came, nor how they died. There are representatives here of every country on the face of the earth; the households that have been desolated by their absence are in all lands. As they were mostly young men, none of them very old, their loss was the more keenly felt. They were husbands and fathers, leaving wives and children behind; they were sons, who could not well be spared from home; they were tenderly reared youth, who should never have been snatched to go out on this rough and perilous life; and some there were who had other ties than those of kindred—the betrothed left behind suffering often most of all.

As I stood once, years ago, on the vacant site of Sutter's Mill, filled with the thoughts and emotions that such locality was calculated to inspire, there came along a man of venerable appearance, who, accosting, entered into conversation with me. After talking a little, and alluding to the great gold discovery at that place, I went on to say something about the propriety of having erected on the spot a monument to perpetuate that memorable event. "Yes," said the old man, after listening for a time to my talk, "by all means let a monument be erected here; let its foundations be laid broad and deep, that it may last for all time, and let the superstructure be built of death-heads and cross-bones gathered from the nameless graves of the innumerable victims who have perished far from their homes, miserable and alone, in these accursed gold-fields of California;" and the old man's speech took much of the frothy sentiment out of me.

Very aptly, O California, has the artist pictured thee as a comely maiden, presenting rich gifts with one hand, and grasping a scourge of thorns with the other.

SEVERAL Arizona cattlemen are trying to make arrangements for the establishment of a refrigerator line for the shipment of dressed beef to California and Eastern points.

MECHANICAL PROGRESS.

Heating Feed Water by Exhaust Steam.

It has been a commonly accepted doctrine, without any really distinct reason being given for it, other than usage or practice, that feed water for the steam boiler could only be heated to from 170° to 208° or 210° F. We have seen a great deal of energy expended upon the debating of this question, and always with the same general result, viz., that the feed-water heater, although an essential part of the apparatus for steam-power, was at the same time incapable of accomplishing anything more than our grandfathers accomplished in 1784, and that for the same reason the stove was carried in one end of the bag and the corn in the other, the man who attempted to show feed water higher than 208° or 210° must either be stretching the truth or yielding to the delusions of his imagination.

We have recently had some experience in this matter which has been valuable to us, and at the risk of stating a thing which is not so, or being mistaken, we propose to give some facts. We have often spoken and written upon the general delusion of throttling steam, carrying it around a variety of corners, angles, bends, and of the necessity, in working steam, always to work it as free as possible from the boiler to the end of the exhaust pipe. The same thing refers to some of the feed water heaters which are now in use. Their inventors or constructors, from a lack of knowledge, seem to suppose that steam can be carried up and down, around and around, or can go through sundry gyrations in its course, with a presumptuousness on our part that the designer supposed that, with little obstructions in the passage of the steam, he was going to give out more heat to the water. But this is all wrong. The old idea holds good, and practice demonstrates its correctness; if the steam is to make a turn in its exhaust, give it ample room in which to do it, but the nearer a direct line the steam can flow the better, not only for the freedom of exhaust, followed by no back pressure, but as well for its giving out the heat it contains to the feed water, with which it comes indirectly in contact. It is no uncommon thing now to find positively no back pressure, free exhaust of the steam, and yet to find feed water going into the boiler at 214° F., and not using a doctored thermometer to accomplish it either. In other cases as high as 220°; we do not know but even higher than this, has been secured.

The reader may naturally ask why and how. That is not for us to discuss; we are dealing now with facts, not with vagaries. Our own basis is, however, that with a rightly constructed heater, the steam shall not be driven through tortuous passages, shall not be deflected from a straight line or free egress, unless, if it has to turn, the area is largely increased over that of the first passage, which must be in excess of the total square inches of area of the exhaust pipe. When an engine exhausts under two, three, five or ten pounds above the atmosphere, there is a temperature accompanying the exhaust, especially where this is being moved rapidly, that gives a very considerable heat out to the water, in case the possibilities exist for the steam doing its work correctly. It is also likely that wherever the construction of a feed-water heater is such that the steam is tortured in its leaving the engine for the atmosphere, the steam is still further reduced even by a trifling back pressure (very much as direct steam is passed through pipes, valves, bends, etc., until it turns more and more to water) returning more and more to water, and reducing its sensible heat and its capacity for imparting heat to the feed water, with which it comes indirectly in contact.

If we take steam at the atmospheric pressure of fifteen pounds, we have 213° sensible heat. If, now, we add ten pounds release, it certainly requires a little time for that pressure to equalize itself, or come down to the pressure of the atmosphere. In that case we have 240° of heat for a time. Now, let us suppose the heater to be properly arranged so as to aid in partially condensing the steam, or at least by making a change of 30° or 40°, will it not aid to bring the steam to the heater quicker, something after the manner of an air pump, than it would if we allowed free flow, depending upon the pressure and the pulsation of the engine? Why not, then, utilize some of the difference between 212° and 240°? We often hear men speak, when looking at the exhaust pipe, of the impossibility of heating feed water with exhaust steam at the atmospheric pressure. A quarter or half-pound increase over atmospheric pressure carries with it a slight increase of temperature, and it is no uncommon thing for us to see exhaust steam shoot into the air from the top of a building four, five, or in some cases twenty feet high. Is there not a difference between atmospheric pressure and the pressure of the steam whenever this occurs? If the actual pressure of the atmosphere is 14.7, it strikes us that 15 or 15½ pounds only are necessary to make quite a shoot of exhaust steam into the open air, and this makes a corresponding increase in temperature. Now, if the heater be rightly constructed, there is no difficulty, it seems to us, in accomplishing more than 208° or 210°, or 212° in the feed water for the boilers. We have seen the thing done, and know that it is being done every day, consequently it is past theoretical confirmation. It

is not a matter of old usage or ancient practice, but a fact that to-day water, when confined, can be heated to exceed 212 degrees F., but in too many cases it is from 30 to 50 degrees below that amount, as we have over and over again proved in our last twenty years' experience in this line, and we believe there is a chance still for progress in the heating of feed water or of increasing the temperature wherever the engine exhausts under pressure of several pounds above the atmosphere. On the authority of the *Western Manufacturer*, in which journal the above article appears, it advances the opinions of one of the ablest scientists in the country.

THE "WEDGE METHOD" OF FIRING.—A correspondent of the *British Journal of Commerce* communicates to that paper the following hints on "firing." While looking over my books I came to a method of firing called the wedge method. It is the favorite way of the ignorant, careless and lazy fireman. It consists in banking up the coal near the furnace door and sloping it off to almost a point at the back end, in a wedge shape. The careless and lazy fireman fires in this way because it does not require much labor to shovel coal just inside the furnace door, and the ignorant one does so because appearances deceive him. He peeps through the holes in the door and sees the whole furnace apparently full of fierce, roaring flames, not knowing that it is only the cold air rushing through the bars so thinly covered, and he wonders why such a fire does not make plenty of steam. Boys, let us have a little talk over the ways of the fireman and his methods. I have seen a man who called himself crack put in fifteen shovelfuls of coal and screenings mixed, and when I asked him if he was banking he said "guessed not, he was coal-ing up;" but he must have been killing out what fire he had. The grate was six feet square. There is another question which I should like to ask the engineer. There is a water tank placed in the upper story of a mill, seven stories high; the water is pumped from the lower story through a pipe four inches in diameter; the tank holds a thousand gallons and is six feet high; on this water be forced through the bottom of the tank easier than in over the top, provided it has no syphon?

MECHANICAL INDUSTRY is the characteristic feature of our time, and its development has been so rapid that, by and with the instruments furnished, the laborers of to-day can accomplish four times as much work as did those who preceded us 50 years ago. Mr. Gladstone once remarked that Great Britain was enabled, by labor-saving machinery to perform the work of 600,000,000 hand laborers, or as much as twice the hand labor of the adult laboring population of the globe, unaided by machinery. With the rapid strides making in improved mechanical appliances we may look forward to the not very remote future when hand toil alone, so crushing and so wasteful, will be among the things of the past, and to the time when by devoting only a portion of the day to manual labor we shall live in more comfort, and secure the leisure so necessary for study, culture and recreation. But as nothing can be accomplished without work, the inventors and manufacturers who lighten its duties and shorten its hours are true benefactors, for they are always contributing something to the common benefit. The modern appliances which are continually being brought forward in this country as labor-saving machines perform their work well. If they did not do this the manufacturers would soon find out that second and third rate work would amount to nothing more nor less than neglect of duty and waste of opportunity.

TEMPERING STEEL WITH LOW HEATS.—Some curious statements on tempering steel are made in a paper published in *Dingler's Polytechnic Journal*, Vol. 225, by Herr Jarolimek, "On the Influence of Annealing Temperature upon the Strength and the Constitution of Steel." Hitherto it has been generally considered that to obtain a specified degree of softness it is necessary to heat the hard steel to a particular annealing color—that is to say, to a definite temperature—and then allow it to rapidly cool. Thus for example, that steel might anneal—be tempered—yellow, it had to be heated to 540 degrees, and the supposition was formed and acted upon that it must be allowed only a momentary subjection to this temperature. Herr Jarolimek says the requisite temper which is obtained by momentarily raising the temperature to a particular degree, can also be acquired by subjecting the steel for a longer time to a much lower temperature. For example, the temper which the annealing color—yellow—indicates can be obtained by exposing the hard steel for ten hours to 260 degrees of heat; in other words, by placing it in water rather above the boiling point.

CHISELS should be made short for hard, rough work. They transmit the power or force of a blow much better. Long chisels are apt to "broom up" on the hammer end, as the long steel through which the blow passes has more chance to absorb the force of the blow. The harder the metal to be worked the quicker the blow should be transmitted. Cast-iron works much better with a short steel chisel and light hammer than if the blow was struck upon a very long chisel with a heavy wooden mallet. In one case the blow is delivered all at once, in the other it takes time, and much of the force is absorbed.

SCIENTIFIC PROGRESS.

Distinction Between Animals and Plants.

The lower organisms exhibit such simplicity of structure that naturalists find it extremely difficult to determine, in many cases, whether a certain group of organisms should be classed among animals or plants; and the question is so difficult to decide that there is much difference of opinion among the best informed specialists as to the proper position of a large number of such lowly organized beings. Prof. E. Frankland a distinguished chemist, has lately submitted a generalization which appears to be a good one to decide this vexed question. He defines plants as "organisms possessing synthetic functions, or such in which these functions greatly predominate." By this generalization, animals would be defined as "organisms performing analytical functions, or such in which these functions greatly predominate." On the strength of this generalization he refers the "microbia," such as bacteria and bacilli, to the animal kingdom, inasmuch as their life "essentially depends upon the tearing asunder of more or less complex compounds, resolving them into simple compounds, at the expense of potential energy."

The editor of the *Journal of Science*, in a recent criticism of this definition, holds it to be untenable, and that when we come to the lower forms of life, no distinction between animals and plants can be made. The vast majority of plants, he points out, take into their system the carbonic acid of the atmosphere—a compound—and decompose it, exhaling the free oxygen and retaining the carbon. This, he adds, is surely an analytical process. The vast majority of animals, on the other hand, take into their lungs, tracheæ or gills, free oxygen and convert it in their bodies into the compound, carbonic acid. This appears to be a synthetic process.

Again, he makes the point that, while generally plants feed on inorganic material, or upon organisms that have been decomposed into such simple substances as ammonia, nitrogen acids, etc., building up complex molecules out of them, there is a numerous group of carnivorous plants which feed, like animals, on ready-made albuminoid matter, and seem to require it if they are to flourish. Here the reference would appear to be justified that such plants have not the power to form such matters synthetically in a sufficient degree to meet their needs. In this case, therefore, the definition of Frankland is inadequate, and the distinction between animals and plants, based upon it, is valueless.

Again, he points out that Englemann has found animals—vorticellæ—which decompose carbonic acid and assimilate its carbon by means of a chlorophyll, forming part and parcel of their own living structure. He concludes, from these and other interesting discrepancies and anomalies, that Prof. Frankland's paper, though in other respects of great value, must be regarded as an attempt to revive an arbitrary and fast-fading distinction.

The Sun as Photographed.

The photography of the sun has been carried further in France than in any other country. A very interesting lecture on this subject was recently given before a New York audience, from which we extract as follows:

The sun's surface looks rough, like drawing paper; it is not a smooth surface, such as water would present, but it is in all probability a surface of clouds. Here is one of Janssen's pictures (not illustrated here). On that scale the sun would be about 200 feet in diameter. You can see here the form and character of the granules on the solar surface. You will notice that in one place the granules are nearly round; they look like finger tips turned towards you. In this corner, on the other hand, they are lying sideways toward you, and appear much elongated. There is another place where the filaments are disturbed. Janssen found that if you take a pair of these pictures, at an interval of one minute, they would very nearly agree in all particulars, but if an hour or more should elapse between the pictures they would differ enormously; and remember that every one, even of these smallest granules, is 200 or 300 miles in diameter. The surface of the sun seems to be made up of cloud-like masses floating in a gaseous atmosphere. Prof. Langley compares the appearance of the surface of the sun to snow-flakes on a gray overcoat, and an English physicist has said that it looks like pea soup.

Sometimes we wish to study the sun with the eye instead of by photograph. The photograph, of course, tells no lies, but it gives merely a brutal copy of what can be seen at any particular moment. With the eye you can look leisurely and study what you see. The sunlight is so bright, however, that you must find some means of diminishing it. The apparatus now shown on the screen (not here illustrated) is the best for that purpose. It is known as a helioscope. The little thing is about five inches in diameter and five or six inches long. Here the sunlight enters; it is reflected at the first surface of glass, most of the light goes through the glass, but a little is reflected and strikes on this second surface; most of that light goes through again and the remainder is reflected. We first throw away nine-tenths of the light, and then throw away

nine-tenths of what is left. The remainder is reflected to another mirror of black glass; it is again reflected, and thus suffers four reflections before reaching the eye, each reflection at the angle of polarization. The upper box turns round upon the lower one; when I turn one at right angles to the other I can cut the light entirely off, but when they are turned so that the mirrors are all parallel to each other the light is quite bright, so that by turning the upper box I have all the degrees of brightness. You thus see the solar surface with the greatest ease and comfort. We do not cut down the size of the lens, but let the whole light come through and then throw away what we do not want, leaving enough for vision. I ought to say here that it is a mistake to cap the object glass of the telescope in order to diminish the light; sometimes you have to do it if you have not a proper eye piece, but the definition is never so good on account of diffraction effects, and with such a helioscope as I have described there is no difficulty in observing the sun with the whole 23 inches of aperture of our Princeton telescope.

THE SCIENCE OF SOIL.—An observant correspondent of the *German Town Telegraph* notes on this topic: "Soil, in contradistinction to mere earth, is always composed of silica, alumina, lime, magnesia, oxide of iron, salts, and decayed animal and vegetable matter. The difference then between earth and soil, technically, is that earth has its fertilizing properties either so nearly absent or so unevenly balanced as to be incapable of supporting vigorous plant-life. Soils are fertile in proportion to their combination of such elements as are required by the particular plants to be grown, and their ability to obtain and retain moisture sufficient to maintain during the growing season the activity of decay in their fertilizing components so necessary. The ideal perfection of soil and moisture is when the action of the constituents is gently vigorous while the seed is sprouting, increasing as the heat of the sun increases during summer, and slackening toward fall to ripen the plant for winter. A good soil resting on a subsoil of sand or gravel is best, because it contains heat and moisture, without too much heat or too much wet, as a superabundance of either checks decay of the elements of the soil and stops growth. The best soil is worse than none if it does not possess a due proportion of heat, of light, and of moisture, which must also vary as the season advances.

THERMOMETER MAKING.—The thermometer that will rise the highest in summer and fall the lowest in winter is a "joy forever." An absolutely accurate instrument depends entirely on the care given in its manufacture. The first step in the making of a thermometer is to draw the tube out of a mass of soft glass into which a bubble of air has been introduced; then the bulb is blown by a skillful workman, who from long practice is able to blow it almost the exact size. The next step is the filling of the bulb, which is done by gently beating the tube and causing the air to expand; the end is then dipped in mercury, a small portion of which is drawn into the bulb. The mercury is then carefully hoiled, and as soon as it expands, filling the tube and bulb with vapor, the end of the tube is again introduced into the mercury, which again fills both bulbs and tube. The instrument is then heated to the highest point intended for it to register, and the excess of mercury flows out, after which the end of the tube is closed. After this the freezing and boiling points of water (32 degrees and 212 degrees) are marked and the intermediate gradations put in, when the thermometer is ready for use. The evenness of the bore and the size of the bulb determine the accuracy of the instrument.

HOW FAR CAN ONE SEE?—A discussion is going on in Europe concerning the distance at which large objects on the earth's surface may be visible. Emil Metzger mentions that he once saw, with some difficulty, Keizerspicket, in Sumatra, when distant 110 English miles, and he also made out Gug Merapi, in Java, when 180 miles away. From the Piz Muraun, near Disentis, E. Hill has seen Mont Blanc, the intervening space measuring about 110 miles. J. Starkie Gardner states that Mont Blanc is visible from the Piz Langer, though distant about three degrees. In Greenland, Mr. Whymper beheld a mountain from which he was separated by 150 miles, and from Marcellus Zuch saw Mount Canigon at a distance of 158 miles. The whole range of the Swiss Alps has been looked upon by J. Hippley while 200 miles away, while Sir W. Jones has affirmed that the Himalayæ have appeared to view from the great distance of 224 miles.

THINKING AND WORKING.—In our present system of education now, happily, rapidly passing away for a better one, we want one man to be always thinking and another to be always working, and we call one a gentleman and the other an operative, whereas the workman ought often to be thinking and the thinker often to be working, and both should be gentlemen in the best sense. As it is, we make both ungentle, the one envying, the other despising the other, and the mass of society is made up of morbid unhealthy thinkers and miserable workers. It is only by labor that thought can be made happy, and the professions should be liberal, and there should be less pride felt in peculiarity of employment and more in the excellence of achievement.

SAN FRANCISCO:

Saturday Morning, Sept. 19, 1885.

TABLE OF CONTENTS.

EDITORIALS.—Bed-Rock; Silver in Oregon; Proper Land Districts for Mines; A New Ore Crusher, 193. Passing Events; Dredging the Gold Coast Rivers; Sierra County Mines; English and American Yacht Models; Ores and Minerals in California, 196. An Important Strike at Colfax; Caves in Connection with Ore Bodies, 197.

ILLUSTRATIONS.—F. A. Huntington's Improved Ore Crusher, 193. Sketch of the Big Oak Tree Mine, Placer County, Cal., 197.

CORRESPONDENCE.—A Little Mining Philosophy; Formation of Mineral Veins, 194.

MECHANICAL PROGRESS.—Heating Feed Water by Exhaust Steam; The "Wedge Method" of Firing; Tempering Steel with Low Heats, 195.

SCIENTIFIC PROGRESS.—Distinction Between Animals and Plants; The Sun as Photographed; The Science of Soil; Thermometer Making; How Far Can One See; Thinking and Working, 195.

ENGINEERING NOTES.—Running Engines with Water Wheels; Traction and Strain on the Brooklyn Bridge; An Important Irrigation Enterprise; Gun Cotton for Steam; An Underground System of Railway for Paris, 199.

USEFUL INFORMATION.—Homoeopathic Remedies; A Pea Shelling Machine; To Remove Dry Rot; Soluble Glass as a Preservative; Improving Gypsum; Toughened Glass; A Good Idea; Butternut Wood for Shoes; Improving Commercial Copper; Steam Pipe Jacking; Etching of Iron and Steel; Lubricant for Heavy Bearings; A Good Coating for Iron; Cement for Petroleum Cisterns; Cost of an Ocean Steamship, 199.

GOOD HEALTH.—Hay Fever and Its Cure; What Pneumonia Is; Induced Nervous Conditions; Safe from Disease; What are the Causes of Nervousness, 199.

MISCELLANEOUS.—Nevada Coal; The Overland Monthly, 194. Practical Hydraulics, 198.

MINING SUMMARY.—From the various counties of California, Nevada, Arizona, Montana, New Mexico, Oregon, and Utah, 200-01.

MINING STOCK MARKET.—Sales at the San Francisco Stock Board; Notices of Meetings, Assessments, Dividends, and Bullion Shipments, 204.

Passing Events.

It is stated that a meeting of miners was held at Candelaria, and when the wages was brought up 77 voted to accept the proposition of the mine managers, and agreed that all who wished to go to work for \$3 per day should have the privilege of doing so. In accordance with this decision work was resumed in the mines, all hands starting in with a will at \$3 per day. A large additional force is to be put to work as speedily as practicable.

A new mining district called the Telephone has been organized near Hicke district, Nevada.

There is a revival in American district, 20 miles from Unionville, Nev., on the east side of the Lower Humboldt range.

The exciting feature of this week has been the international yacht race for the America's cup. The English and American types of vessel contested, and for the sixth consecutive time the American type has been the victor.

A GLASS FACTORY FOR CHINA.—Two Chinese gentlemen of wealth and intelligence made a tour of the Pittsburgh glass houses last week, with the view of establishing the glass manufacturing industry in China under Government protection.

THE BICYCLE is to be officially introduced into the Bavarian army. A number of the soldiers of the garrison of Munich are at present doing orderly service for the purpose of trying the practicability of the "wheel."

LESS than twenty miles remain to complete the gap between the California Southern and Atlantic and Pacific Railroads.

Dredging the Gold Coast Rivers.

A company has been incorporated in England for dredging the Ankobra river for gold. Letters are being written to the London papers by ex-residents of West Africa encouraging the plan and vouching for the richness of the river beds. It is probable, therefore, that stock in this new company will be easily sold, for there is a charming idea to people who do not know anything about it in being able to scoop up the gold by buckets.

But those who care to investigate a subject before investing, will go slow before they take up any project of this kind. We have very rich river beds in California, and it was a day dream with many a miner, to dredge for the gold by steam and scoop up the gold.

The fact is to be regretted, however, that wherever this plan has been tried it has failed. We have had all kinds of dredges built for this purpose and every one of them has failed. They never get any gold. We have tried them on the rivers and on the edges of the ocean. We have had scoop dredges, suction dredges, vacuum dredges and hydraulic apparatus. All have failed. The problem is not an easy one, as our English friends will doubtless find to their dissatisfaction after they have spent a few hundred thousand dollars in their venture. If they do not care to take our experience for nothing they can, of course, pay for their own.

Formation of Mineral Veins.

On page 194 of this number of the PRESS is an interesting letter on this subject from a correspondent in Glendale, Montana. He sends with his letter a little "tin type" plate, covered with fine veins of metallic silver, formed in the manner he describes. We should like to have those interested in the subject examine the plate, which we have at our office for that purpose.

The little veins of silver are most abundant at the edge of the plate, but they branch off towards the center. The largest veins are isolated and run across the plate its narrowest way. Where they are close together they are finer. They are all very plainly marked and the connections can be readily traced. The whole plate is a very beautiful one, being clear black with the white veining of the silver in clear distinctness.

To those interested in geological subjects the plate will be of interest. We should be glad to have it carefully examined with reference to the theory advanced by our correspondent, by some one who has made a close study of the subject. It is seldom such plates are found with the silver veins showing more than a quarter of an inch from the edges.

Sierra County Mines.

Many of the mines in Sierra county are doing very well. The drift mines there are some of them very profitable. The work accomplished by the Bald Mountain Drift mine is well known, and now another one near it, on the Bald Mountain extension, is in a position to be profitable. For a long time they have been at work on it opening the claim. This mine, which is at Forest City, finished working out its rich gravel lead on the South Fork ground some three weeks ago, since which time they have been developing the channel on their own ground, with 70 men employed. Their first clean-up for five days' work was 166 ounces of gold. The second, last week, was 204 ounces. The company is out of debt, and expects soon to have regular monthly dividends.

There is a general revival in drift mining and quartz work this year in Sierra county, and they expect a genuine mining boom there next year, or sooner. Most all the mines prospect beyond expectation, and are very remunerative investments. The mineral resources of the county are being rapidly developed with very encouraging results.

WORKING SMALL LEDGES.—Along the road from Dayton to Gold Hill can be seen small squads of men working into the hillsides wherever the sight of a pay streak of ore presents itself. An old Comstock miner tells the *Enterprise* that the amount of ore taken out by those engaged in such labor is very much more than generally supposed.

It is said that the tin mines in the Black Hills, D. T., will soon be in a condition to produce 3000 tons per year.

English and American Yacht Models.

The international yacht races this week, between the American sloop *Puritan* and the English cutter *Genesta*, have awakened interest on the question of yacht models, and the relative merits of the types of vessels of both nations. The American model has proved its superiority again, winning two races out of three, one in a light wind and one in half a gale, proving itself to be the best "all round" boat.

This old yacht *America*, built by the famous George Steers, first showed to the English nation that we could build fast vessels. She won the great international race, in English waters, in 1851, and carried off the cup which we have held ever since. Since then the English have sent as representatives the *Cambria*, *Livonia*, *Atlanta*, *Countess of Dufferin* and *Genesta*, and we have beaten them all, in set races.

There is a very great difference in the types of racing vessels of the two nations. The English representative boat is a cutter, or one-masted boat, with very narrow beam and great depth, carrying an immense weight of lead on its keel. Their bowsprits are made to slide in so that as sail is reduced the bowsprit is shortened. Their mainsail is not laced all along the boom, but is secured to the boom at its ends only.

The American sloop is wide and comparatively shallow. Some of the ballast is carried inside, and less in proportion on the outside of the keel. Our mainsails are laced along the boom to make them set flat. Our bowsprits are "standing," that is, they are immovably fixed, and our jibs slide on fixed stays and are not set flying as the English are. The main feature with us is the centerboard instead of the keel, to prevent eliding to leeward.

Perhaps comparative figures of the two racers in the recent contest will best convey the idea of difference in sizes. The dimensions and elements of the two yachts are as follows:

	<i>Puritan</i> .	<i>Genesta</i> .
Length over all.....	93ft.	96ft. 5in.
Length on waterline.....	81ft. 11in.	81ft. 7 1/2 in.
Extreme beam.....	22ft. 7in.	15ft.
Extreme draft.....	8ft. 5in.	13ft. 6in.
Depth of hold.....	11ft. 9in.	11ft. 9in.
Displacement, tons.....	105	150
Ballast on keel, tons.....	27	70
Ballast inside, tons.....	20	2
Ballast, total tons.....	47	72
Ratio of ballast to displacement.....	.45	.48
Tonnage, U. S. A. rules.....	140	80
Racing length, N. Y. Y. C. rule.....	88.85ft.	83.05ft.
Mast, deck to hounds.....	60ft.	52ft.
Mast, heel to cap.....	73ft.	77ft. 10in.
Mast, diameter in partners.....	18in.	17in.
Topmast, fid to sheave.....	44ft.	44ft. 6in.
Bowsprit, outboard.....	24ft.	36ft. 6in.
Boom, length.....	76ft.	70ft.
Boom, diameter.....	14in.	14in.
Gaff.....	47ft.	46ft.
Spiroaker boom.....	62ft.	64ft.
Sail area, by rule.....	7,982ft.	7,387ft.
Topmast, block to deck.....	102ft. 11in.	97ft. 2 1/2 in.
Bowsprit to boom end.....	144ft. 7in.	140ft. 6in.

The English claim that with their deep keels and outside ballast the boats will carry more sail than ours, and beat to windward better. The Americans claim that with our wide beam we can carry sail as well as they, and that our centerboards will let us go closer to the wind than their keels. And the contests have proven that our theory is correct. The *Puritan* has outweathered and outsailed the *Genesta* in both light and heavy weather. The advocates of the English system said if they could have plenty of wind they would "drown out" our boat and easily beat her. The wind in the last race blew from 29 to 37 miles on time, and yet, in going to windward our centerboard craft beat them over three minutes. And this in the Englishman's own chosen weather. It is a triumph for the American idea, and one of which we may well be proud, for the *Genesta* is conceded to be the best all round yacht in England.

This was really a battle of the two types. A perfect English racing cutter met a perfect American sloop. The practical results of the trials, will, of course, overthrow all the previous theories. The centerboard boat has proven her superior weatherly qualities, in both light and heavy weather. It is more particularly a great victory for us, for we built our representative specially to meet the *Genesta*. We had no sloop large enough in our waters to fairly compete with her. The New Yorkers built one boat, and the Bostonians another. Both these new boats beat all the old ones badly, and the better one was chosen to meet the English representative.

It proves, moreover, an advance in American ship building, because we have built two boats for a special occasion which outsailed all the old models. So that really we have outdone

ourselves, and made these improvements in our own types which we before believed impossible. The new boats are better than the old ones in that they are more able. They have more depth and are in every way superior to the old style of shallow craft they used to build for smooth water sailing.

Having won the cup for the sixth time, it will probably be a year or more before our English cousins send over another yacht to compete for it. As it is, we have proven the superiority of our designs—a great and signal triumph for American naval architecture.

Ores and Minerals in California.

In addition to gold and silver there are several other mining products of this State, which exist in various counties, some of which are mined for and others not. There is plenty of opportunity for people to go to work on the various deposits, which are known to exist. But, strange to say, many products which abroad are looked after are here neglected. From the records of the State Mining Bureau the following list of minerals was compiled to show the ores, minerals and other mineral substances of industrial importance which are at present mined:

Aragonite (Suisun marble), Solano county; used for mantels, pedestals and smaller ornaments. Asphaltum, Los Angeles, San Luis Obispo and Santa Barbara counties; used extensively in paving, roofing, etc., and employs considerable capital and labor throughout the State. Calcite (limestone), burnt for lime in Santa Cruz, Placer, San Luis Obispo and Napa counties. Calcite (marbels), quarried for coping and building, in Calaveras and Tuolumne counties; for making lime in Santa Cruz and Amador counties; as flux for iron works in Placer county. Cement, Solano county. Chromic iron ore, San Luis Obispo, Tuolumne and El Dorado counties; shipped to the Eastern States in large quantities. Clay, Contra Costa, Placer and El Dorado counties; used for pottery, but no fine ware yet made. Cinnabar, Lake, Sonoma, Napa, Fresno and Santa Clara counties. Copper ore, Calaveras, Nevada and Fresno counties. Galeua (lead ore), Inyo county. Granite, Sacramento and Placer counties. Salt, Alameda county; large investment for manufacturing salt from the water of the bay of San Francisco. Iron ore, Placer and Shasta counties. Lignite, Contra Costa and Placer counties. Mercury (native), in some of the cinnabar mines. Petroleum (coal oil), Santa Clara, Santa Cruz, Los Angeles, Ventura and Santa Barbara counties. Pumice stone, San Francisco county. Sandstone, Solano county. Saponite (rock soap), Ventura county. Steatite (soapstone), Placer county; used as furnace lining; sawed into bricks for the market. Thiolite (gallussite), Mono county; used for making lime. Tincal (borax), San Bernardino county. Tufa, Santa Cruz county; used for making cement. Ulexite (borax, borate of lime), San Bernardino and Inyo counties.

The list of ores, minerals and mineral substances of industrial importance and known occurrence in this State, but which are not at present mined, is larger, and is as follows:

Alabaster, Alabaster cave, El Dorado county; also in Solano, Tuolumne and Los Angeles counties. Aragonite (onyx marble), San Luis Obispo, Siskiyou, Placer and Kern counties; found in small fragments not large enough to work. Arsenic ores. Asbestos, Tulare, Yolo and Mariposa counties; in small quantity, limited market. Asphaltum, Mendocino and Sonoma counties; in small quantity. Azurite (blue carbonate of copper), Inyo, San Bernardino and Shasta counties. Barite (barytes, sulphate of baryta). Bismuth ores. Bitumen, Santa Clara county. Buhstone, Inyo county. Calcite (marble), Monterey, Nevada and Kern counties. Calcite (limestone) San Bernardino, Mono, San Benito, Inyo and Calaveras counties. Cassiterite (tin ore) San Bernardino county. Temescal district. Cement, Alameda, Amador, Santa Cruz and Contra Costa counties. Chalk, Silver Mountain district, Alpine county. Chromic iron ore, Sonoma, Santa Clara, San Mateo, Napa, Fresno, Amador, Sacramento, Tulare and Solano counties. Cinnabar, many deposits in El Dorado, Fresno, Kern, Napa, Solano, San Luis Obispo, Yolo, Santa Barbara and Tuolumne counties, which cannot be worked at a profit at the present price of quicksilver. Clay, Kern, Tuolumne, Amador, Mono, Marin, Lake,

Inyo, Sonoma and Mendocino counties. Chrysocolla (silicate of copper), Inyo and San Diego counties. Diamond, in gold placers, Shasta, Butte and other counties. Erythrite (red cobalt ore), Los Angeles county. Feldspar, Mariposa county. Galenite (galena), San Bernardino, Mono and Amador counties. Granite, Mariposa and Nevada counties. Graphite (plumbago), Calaveras county. Halite (salt), Inyo and San Bernardino counties. Hematite (iron ore), Amador, Inyo, Alameda, Del Norte, Alpine, Butte and Nevada counties. Iridosmins, in gold placers. Lignite (coal), is found in inferior quality or small quantity in the following counties, but in some cases further development will probably show better results: Amador, Monterey, Lake, San Benito, Los Angeles, Kern, San Bernardino, Fresno, Calaveras, San Francisco and Lassen counties. Limonite (iron ore), Calaveras, Tulare, San Luis Obispo, Placer, and Santa Clara counties. Litharge, San Bernardino county. Lithographic stone, Kern county; quality fair; quantity not known. Malachite (green carbonate of copper), San Diego, Colusa, Shasta, Tuolumne, Los Angeles, Amador, Tulare, Del Norte, Placer, Contra Costa, Mono, San Luis Obispo, Sonoma,

An Important Gold Strike at Colfax.

The Big Oak Tree mine is situated about one mile in a westerly direction from the town of Colfax on the Central Pacific Railroad, and directly on the old Grass Valley stage road. The discovery of this mine marks a new and important era in the mining property of this section, and at once makes an assured success of a region lately looked upon as comparatively exhausted. The discovery of this auriferous lead was made by Mr. William Werry, of Colfax, who followed closely scientific mining theories that he had conned over in his mind for a number of years. The lead was completely "blind," covered over by a thick deposit of soil and gravelly formation, hidden from all eyes but those of the practical miner, who had become, as it were, *en rapport* with nature in these rolling hills, so thickly covered with timber and tangled underbrush.

Mr. William Werry was for many years superintendent of the old "Rising Sun" mine, which produced something over \$3,000,000, paying almost a steady stream of dividends for over 20 years. Mr. Werry carefully observed several underground phenomena in the Rising

shaft 8x4 sunk on the vein under the umbrageous branches of the "big oak" tree at first. To this friendly shade was afterwards added appropriate buildings, a powerful whinn supplanting the bucket, and the shaft sunk to a depth of 100 feet, the ore taken out in this sinking being milled at the Rising Sun mill, paying expenses as quickly as they were incurred. It was then decided to sink a second shaft again upon the vein, and some 300 feet westwardly; this shaft is 10x4, double compartment, timbered throughout with man-way, and all perfect modern appliances for hoisting, pumping, ventilating, etc. Over this second shaft is now erected the new steam hoisting works with engine and boiler of 30-horse power, built at the Grass Valley foundry where mining machinery is not built as mere matter of show, but as a practical exposition of means to an end. From the 100-foot station of this second shaft (as shown upon diagram) a connecting drift has been run to the old shaft which will always serve as a ventilating apparatus during all future workings in depth. All of this superstructure has been well and substantially built under the personal superintendence of Mr. Werry, who is one of the oldest practical miners in this section of country.

SKETCH OF THE BIG OAK TREE MINE, PLACER COUNTY, CAL.

Mariposa, and San Bernardino counties. Magnetite (magnetic iron ore), Shasta, Amador, Plumas, Butte, Yuba, El Dorado, San Benito, Mariposa and San Diego counties. Marl, various localities. Muscovite (mica), El Dorado and Mariposa counties. Nickel ore, San Benito and Kern counties. Ochre, red and yellow, Calaveras and Sonoma counties. Platinum, Mendocino and Trinity counties. Pumice stone, Mono and San Diego counties. Iron sulphurets, Alpine, Amador, Placer, Lake, Inyo, Nevada, Shasta, Tuolumne, Mono, El Dorado, and San Luis Obispo counties. Pyrolusite, (manganese ore), Sonoma, Tuolumne, Marin, Calaveras, Mariposa and Alameda counties. Sandstone, Santa Clara, Shasta, Tuolumne, San Mateo and Napa counties. Saponite (rock soap), Santa Barbara county. Selenite (gypsum), Ventura, Los Angeles, Monterey, Kern, Lake, Santa Barbara, Tulare and Lassen counties. Sphalerite (zincblende "black jack"), Tulare and San Mateo counties; small deposits of no present value. Steatite (soapstone), Yuba, Tuolumne, Kern, Los Angeles, Nevada, Fresno, Amador, Marin and Tulare counties. Stibnite (sulphide of antimony), San Benito, Los Angeles, Tulare, Santa Clara and Kern counties. Strontianite (carbonate of strontia), Sulphur, Lake and Napa counties. "Syenite," San Mateo county. Thenardite (sulphate of soda), Inyo county. Thionite, gaylussite, Lassen county. Trona (carbonate of soda), Inyo county. Tufa, Kern, Shasta, Mono and San Luis Obispo counties. Ulexite (borate of lime), Kern county.

Sun mines from grass roots to the 1000-foot level, and coupling these with overground indications, such as rich float in places, contour of surrounding country, and the rich placer products of the bed of Bear River, led him to prospect by running deep cuts, commonly called "Irish tunnels" scarring the hills in every direction. Finally at the roots of a big oak tree from which the mine takes its name, he struck a stratum of quartz in places no thicker than a knife blade; this he commenced to follow downward convinced that it was the apex of the missing lead, until it widened to three, four and finally at 100 feet to 20 inches in thickness, showing rich in sulphurets and free gold in almost every piece.

He had now discovered a mine identical in every respect with the Rising Sun, as regards character of ore, country formation, and every other characteristic of that famous gold producer, and the lead on further exploration proved to be a parallel vein to the Rising Sun, running in the same course not more than 300 feet apart in a southerly direction. The rock, as before stated, shows free gold throughout, and the whole product of the vein has averaged from \$80 to \$100 per ton. Since its discovery the mine has been self-supporting and has already paid the cost of erection of elegantly equipped hoisting works and pump, driven by an engine of 30-horse-power, and capable of sinking on the vein to a depth of 600 feet or more. The explorations consist of a

Referring to the diagram it will be seen that the position of this mine is favored by nature to an extraordinary degree. Bear river runs below, and from about its level an adit can be run tapping the vein at about 600 feet in depth. This tunnel will not be over 1000 feet in length, and its numerous advantages need hardly be mentioned. In addition to draining the mine, it will bring out the ore on Bear river canal, where it can be milled by water power, and thus reduce the cost of mining and milling to not over \$3 per ton; while this great adit level could be easily completed in six months at a cost not to exceed \$10,000.

In conclusion I would again call attention to the great importance of this discovery. It gives us the Rising Sun mine "redivivus." Another \$3,000,000 can be calculated upon almost demonstrated. If one rich blende lead runs parallel to the Rising Sun not 300 feet apart, why not another, even two or three, to be intersected by the great adit above proposed? It is a discovery of one of the "rich" ore leads that made the Grass Valley region so deservedly famous in early times. It is a discovery in a proved region. The Rising Sun mine paid all the way down to the 1000-foot level, and would be paying yet but for litigation involving the company in other and more uncertain mining localities. Mr. Werry and his fellow-townsmen are to be congratulated on thus obtaining a new lease of prosperity, and as far as your correspondent could observe they bear their blushing honors with becoming modesty.

H. E.

Caves in Connection With Ore Bodies.

In limestone districts, caves are often found and are of frequent occurrences in connection with ore bodies; in fact, it is stated that in some districts no large ore bodies have been found which had no caves over them; but caves are by no means always accompanied by ore bodies. These caves have been produced in part, at any rate, by the solvent action of water carrying carbonic acid. These waters passed through fissures and cracks, enlarging them, and dissolved the limestone especially where it was crushed and broken. This action was naturally most considerable where the best opportunity was afforded for the free circulation of the water, and as the limestone was not uniformly shattered, and as the different varieties of rock did not offer equal resistance, the openings are of very irregular character.

The theory of the formation of these caves, as advanced by Mr. J. S. Curtis, in his Geological Survey Report on the Silver-Lead Deposits of Eureka, Nevada, is as follows:

The formation of caves in limestone is usually attributable to the action of waters percolating from the surface and carrying carbonic acid in solution. As is well known, even rain-water contains carbonic acid in solution, though in small quantities corresponding to the traces of carbonic anhydride always present in the atmosphere. The air occupying the pores of the soil for a considerable distance from the surface is much more highly charged with carbonic anhydride than the free atmosphere, a fact no doubt due to the oxidation of organic matter, and the percolating waters are correspondingly charged with carbonic acid. Below the permanent water-level of a limestone country the water is nearly saturated with calcium carbonate, and though there is a slow circulation of subterranean currents beneath this level, no strong local action can be expected. To form a cave at a given spot, water containing free carbonic acid must be supplied in sufficient quantities, and an escape must be provided for the more or less saturated solution of calcium carbonate which results from the corrosion of the rock. Caves cannot, therefore, form at an indefinite depth from the surfaces of the limestones under any circumstances, for, after passing a certain distance through limestone, this percolating waters would be nearly or quite saturated. Caves, too, can only be found in a country with deep drainage, since otherwise the saturated solvent could not be removed.

The rate of cave formation is dependent upon the quantity of water, the amount of carbonic acid that it contains, and the velocity with which it flows. Climatic changes and changes in the formation from dynamic causes accelerate or retard the action of these waters, as the case may be, but a tendency to the formation of caves exists wherever water percolates through limestone. The solution of limestone ordinarily appears to be accompanied by the deposition of more or less calcium carbonate in the same neighborhood. When the process of solution and deposition go on simultaneously their coexistence is no doubt due to local differences of temperature and pressure. Changes in the amount of percolating water and other circumstances may also bring about deposition where solvent action once prevailed, or *vice versa*. As before stated, the dissolving of the limestone in particular directions has been owing, in a great measure, to the antecedent crushing of the limestone.

The caves in Eureka district are of more frequent occurrence near the surface than they are in depth, no caves of any importance having been found below 1000 feet. They are almost invariably connected with some fissure, and are also often connected with one another by fissures and open pipes. No oxidized ore body of any great magnitude is found without a cave above it, which is usually proportionate in size to the ore body, but all caves are by no means accompanied by masses of ore. Though the caves are very irregular, having ramifications in all directions, they form a system of systems which have a downward trend approaching the foot wall of the formation in which they are found. As the ore bodies are associated with caves, their deposition is, of course, similar.

THE prospectors rooting around in old abandoned prospect holes that were deserted in early days as worthless are now uncovering some excellent silver-lead ore.

PRACTICAL HYDRAULICS.

NUMBER 2.

PRINCIPLES OF HYDRAULICS.

[Written for MINING AND SCIENTIFIC PRESS by P. M. RANDAL.]

[COPYRIGHTED.]

Flow of Water Through Openings.

Openings are of two classes—the *submerged* and the *weir*.

An opening having its top, as shown at *B*, Fig. 1, beneath the water's surface, *AD*, is termed a *submerged orifice*; an opening having an open top, as shown at *C*, the crest, in Fig. 2, is termed a *weir*. In both, the form of outlet, for the most part in practice, is rectangular. This is more especially true with respect to *weirs*.

In Fig. 1, representing a vertical section through a

FIG. 1.

FIG. 2.

rectangular opening, conceive the opening, *BC*, composed of horizontal fluid layers indefinitely thin.

Let *l* = horizontal length of opening.

h = *AB* head with respect to top of opening.

h₁ = *AC* head with respect to bottom of opening.

x = head additional to *h*, and due any horizontal fluid layer indefinitely thin in the opening *BC*.

dx = thickness of such fluid layer.

v = velocity due (*h* + *x*) per second.

Q = discharge of water in cubic feet per second.

Then by (13) $v = (2g)^{\frac{1}{2}} (h+x)^{\frac{1}{2}}$ (16)

$dQ = l (2g)^{\frac{1}{2}} (h+x)^{\frac{1}{2}} dx$. (17)

Integrating (17) between the limits of *x* = 0, and *x* = *h₁* - *h* = *BC*.

$$Q = \frac{2l}{3} (2g)^{\frac{1}{2}} \left(h_1^{\frac{3}{2}} - h^{\frac{3}{2}} \right) \quad (18)$$

Equation (18) expresses the quantity of water, in cubic feet, which will flow through a *submerged orifice* under the general conditions imposed. It is, however, alike applicable to *weirs*.

For, by making *h* = 0, there results

$$Q = \frac{2l}{3} (2g)^{\frac{1}{2}} h_1^{\frac{3}{2}} \quad (19)$$

which expresses the quantity of water in cubic feet which will flow over a *weir* under the general conditions imposed.

The true *mean* velocity of a stream through the *submerged orifice* under the given conditions, is

$$v = \frac{2}{3} (2g)^{\frac{1}{2}} \left\{ \frac{h_1^{\frac{3}{2}} - h^{\frac{3}{2}}}{h_1 - h} \right\} \quad (20)$$

Some hydrolicians assume that the mean head is equal to the distance between the surface and the middle of the submerged orifice; hence, deduce that the mean velocity is by (13).

$$v = (2g)^{\frac{1}{2}} \left(\frac{h_1 + h}{2} \right)^{\frac{1}{2}} \quad (21)$$

Comparing (20) and (21), omitting the common factor $(2g)^{\frac{1}{2}}$;

$$v : v_1 = \left\{ \frac{h_1 + h}{2} \right\}^{\frac{1}{2}} : \left\{ \frac{h_1^{\frac{3}{2}} - h^{\frac{3}{2}}}{h_1 - h} \right\} \quad (22)$$

In refutation of the assumption that the mean velocity of a stream of water flowing from a *submerged orifice*, takes place at the middle of the opening, the following illustrations are presented. By substituting the respective values of the given heads and vertical widths in equation (22), there result:

When the vertical width is equal to one-half the head above it, the velocity is found one-sixth of one per cent too great; when it is equal to the head above it, the velocity is found one-half of one per cent too great;

When it is equal to twice the head above it, the velocity is found one and one-ninth per cent (.0111) too great;

When it is equal to three times the head above it, the velocity is found one and two-thirds of one per cent (.01645) too great;

And when we pass to the limit of the weir, by making *h* = 0, the velocity becomes six per cent too great.

The assumption that the mean velocity takes place

at the middle of a rectangular opening, is thus shown erroneous. It may, perhaps, approximate the truth with sufficient accuracy for most practical purposes, when the vertical width of the opening is less than the head above it; but is inadmissible when the width in comparison is greater.

The formula obtained on the assumption, that the mean velocity takes place at the middle of the opening, is commended by its simplicity of expression. But its application, in case the ratio of the head to the vertical opening is large, involves the use of a coefficient of flow, varying with that ratio. The formula so encumbered would evidently be more complex and tedious of application than that, namely (20), which it seeks to evade or displace.

Water in motion is subject to resistances, which retard its velocity and diminish its volume of flow. Modifications, therefore, are requisite to be made in the theoretical formulas of hydraulics, so that they shall embrace the measure of these resistances, and thereby more fully meet the requirements of practice. These modifications are effected for the most part by coefficients, whose values have been determined by experiment. A coefficient, as here used, corresponds to that part of the theoretical quantity, as velocity and volume, remaining after it has been diminished in amount equal to the loss due resistances overcome. With respect to the velocity of water flowing through *orifices*, a multiplicity of experiments, during a period of many years, have been made with extreme care by the ablest hydrolicians. The tabulated results of these experiments, differing with respect to head and size of opening, vary from .572 to .795.

If the theoretical velocity of water flowing through a rectangular opening with thin sides or lips be taken as a *unit*, then will an average of the experiments referred to, closely approximate .62.

This fraction is very generally adopted—that is, for the entire opening, the theoretical velocity is, to the average experimental velocity, as 100. to .62.

Let it not be inferred that the actual velocity of the flowing water is 62 per cent of the theoretical velocity. Water, in flowing from a reservoir, approaches the opening or outlet in convergent lines. This convergence continues a short distance beyond and outside the outlet, as shown at *m m*, Fig. 1, where occurs the minimum cross section of the stream, and where the velocity is nearly equal to the theoretical velocity. The area of the outlet being taken as the *unit*, the area of this cross section is equal to .637, while the velocity of the stream at this point is equal to .974 of the theoretical velocity. The coefficient of discharge there is equal to the product of these coefficients of cross section and velocity. Let *c* = this coefficient of discharge; then *c* = .637 × .974 = .62 nearly. (23)

In weir openings, the experiments of J. B. Francis, C. E., make *c* = .622. The top contraction seems to have no separate coefficient in the formula volume. *C*, the coefficient of discharge, is also the coefficient of average velocity, at and for the entire opening, but not as hitherto remarked for obtaining the actual velocity, as it occurs at *m m*, Fig. 1. Introducing this coefficient (.622), or modifier $(2g)^{\frac{1}{2}}$ into equations (20) and (21) and making $(2g)^{\frac{1}{2}} = 8.025$ as found, and there results:

$$v_1 = 3.33 \left\{ \frac{h_1^{\frac{3}{2}} - h^{\frac{3}{2}}}{h_1 - h} \right\} \quad (24)$$

$$v = 4.99 \left(\frac{h_1 + h}{2} \right)^{\frac{1}{2}} \quad (25)$$

TO DETERMINE THE VELOCITY OF WATER FLOWING THROUGH A RECTANGULAR OPENING.

Rule 7.—From the square root of the cube of the head of water on the bottom of the opening, subtract the square root of the cube of the head on the top of the opening. Divide the remainder by the difference of these heads, and multiply this quotient by 3.33, the product will be the required velocity.

Rule 7.—Corresponds to Equation (24).

Rule 8.—Multiply the square root of one-half the sum of the respective heads on the top and bottom of the opening, by 4.99.

Rule 8.—Corresponds to Equation (25).

Ex. 13.—In a rectangular opening, the head on the top of the orifice is 2.25 feet, and on the bottom of the opening is 4 feet, what is the average velocity of the flow of water at the outlet?

Cal.—By Rule 7, or formula (24),

Square root of the cube of the head on the bottom of the opening $(4)^{\frac{3}{2}} = 8$;

Square root of the cube of the head on the top of

the opening $(2.25)^{\frac{3}{2}} = 3.375$.

Difference between heads $4 - 2.25 = 1.75$.

Thus: $3.33 (8 - 3.375) \div 1.75 = 8.8$ feet.—*Ans.*

Cal. by Rule 8, or formula (25),

Half sum of given heads $(4 + 2.25) \div 2 = 3.125$, 4.99 times the square root of this quotient.

$4.99 (3.125)^{\frac{1}{2}} = 8.814$ feet.—*Ans.*

Dividing the result obtained under Rule 8 by result obtained under Rule 7.

$8.814 \div 8.8 = 1.0016$.

It is seen that in this case, Rule 8, corresponding to formula (25) gives a velocity nearly one-sixth of one per cent too great.

TO FIND THE AVERAGE VELOCITY OF WATER FLOWING OVER A WEIR.

Rule 9.—Multiply the square root of the head over the crest by 3.33.

Rule 9 corresponds to formula (24) by making the head on the top nothing.

Rule 10.—Multiply the square root of one-half the head over the crest by 4.99.

Rule 10 corresponds to formula (25) by my making the head on the top nothing.

Ex. 14.—In a rectangular outlet, open top, the head on the bottom of the opening is one foot, what is the average velocity of the flow?

Cal.—By Rule 9.

Square root of the given head $(1)^{\frac{1}{2}} = 1$.

Then $3.33 \times 1 = 3.33$ feet.—*Ans.*

Cal.—By Rule 10.

Square root of one-half the given head:

$(.5)^{\frac{1}{2}} = .7072$.

Then $4.99 \times .7072 = 3.53$ feet.—*Ans.*

Dividing result obtained under Rule 10 by that obtained under Rule 9,

$3.53 \div 3.33 = 1.06$.

It is hereby seen that Rule 10 gives a velocity six per cent too great.

Substituting the values of $(2g)^{\frac{1}{2}} = 8.025$,

and *c* = .622 of (23) in (18).

$$Q = 3.33l \left(\frac{h_1^{\frac{3}{2}} - h^{\frac{3}{2}}}{h_1 - h} \right) \quad (26)$$

When *h* = 0, (26) becomes

$$Q = 3.33l h_1^{\frac{3}{2}} \quad (27)$$

Formula (26) is adapted to finding the discharge of a rectangular submerged orifice, and formula (27) the discharge of a *weir*. In the latter case, when the depth of water on the crest exceeds three inches, and does not exceed two feet, and the length of weir is not less than three times this depth, J. B. Francis, C. E., a most eminent experimentalist, determined by careful experiments made on a large scale, and under the most favorable circumstances, that the loss by means of end contraction, is equal to one-tenth the depth of water over the weir for each such contraction.

Introducing this modification in (27) and there results:

$$Q = 3.33 (l - 0.1 nh_1) h_1^{\frac{3}{2}} \quad (28)$$

In which *n* denotes the number of end contractions.

For a weir one foot in length with water one foot deep, Nystrom's Mechanics makes the coefficient 3.135 instead of 3.33.

TO FIND THE DISCHARGE OF WATER OVER A WEIR, WITH CORRECTION MADE FOR DEPTH ON CREST.

Rule 11.—Deduct from the length of the *weir*, one-tenth the depth of water over the crest, for each and every end contraction (usually two), multiply the corrected length so found by 3.33 times the square root of the cube of the depth or head of water on the crest.

Ex. 15.—The length of *weir* being 3.01 feet, cut in two inch planks, and the full depth *h*, over the bottom of the notch 1.023, what is the discharge in cubic feet per second?

Cal.—By Rule 11.

Loss in this case by two end contractions:

$1.023 \times .2 = .2046$.

Corrected length: $3.01 - .2046 = 2.8054$ feet.

Square root of the cube of the given head:

$(1.023)^{\frac{3}{2}} = 1.035$; hence,

$Q = 3.33 \times 2.8054 \times 1.035 = 9.67$ cubic feet.—*Ans.*

Working this example by the *weir* formula given in Weisbach's Mechanics, whence the example is taken, there results:

ENGINEERING NOTES.

ONE of the greatest engineering projects of the age is the proposed sub-oceanic tunnel by which it is proposed to connect the Scottish and Irish coasts. The distance by the proposed route is twenty-one and a half miles, to be driven at a great depth owing to the remarkable trough which skirts the Scottish coast at about a third of the distance between the shores. Sir Charles Crawford, who has given the project great study, considers that the work could be completed within eight years. He states that such a tunnel would bring the coal fields of Ayr within forty miles of the manufacturing of Belfast; would make the magnificent harbor of Lough Swilly the port of call for the transatlantic liners; would bring America nearly 24 hours nearer England, and pour into Ireland such a vivifying stream of life and commerce as would do more to spread comfort and prosperity than decades of remedial legislation. As regards the difficulties of ventilation, he thinks either air engines, daily brought nearer perfection, or electricity, now working a tramway within a score of miles of Donaghadee, or the continuous wire rope, so largely used in America, would enable us to dispense with the smoke-breathing locomotives, and with it banish the bugbear of asphyxia. The enormous traffic which would be created it is confidently expected would easily provide the one and a quarter million dollars for interest on the expenditure of \$10,000,000—the estimated cost of the work.

RUNNING ENGINES WITH WATER WHEELS.—Whenever more power is needed, either constantly or at seasons of low water, or when variable work is being done, a steam engine may be attached to the line shaft which leads from the water-wheel by means of its main band passing over a pulley on side line shaft (situated as near the wheel as practicable), said pulley to have such diameter as will permit both the engine and the water-wheel to make each its own regular speed. The effect of this is as follows: When the supply of water is ample for the work, the governor on the engine will shut off its supply of steam, or nearly so, and the steam will be retained in the boiler, little fuel being consumed. But when the supply of water fails, or the work is greater, for longer and shorter intervals of time the speed of the water-wheel is decreased, when this governor instantly opens the steam upon the engine, which in turn supplies just the amount of power needed to supplement and maintain the requisite speed of the line shaft. So that, as long as the power from the water-wheel is sufficient to overcome its own friction and that of the line shafting, so long will its own water be utilized, even when it would be insufficient alone to accomplish any work at all beyond overcoming said friction.

TRACTION AND STRAIN ON THE BROOKLYN (N. Y.) BRIDGE.—Mr. Roebling, engineer of the bridge, has written a letter in response to inquiries sent to him by Professor Stranahan, of the Bridge Trustees, stating that the bridge could be used without detriment by Pullman cars and loaded freight cars, the weight of which does not exceed thirty tons; but that locomotives of that weight, by reason of their shortness and the concentrated weight, would strain certain parts of the bridge beyond safe limits. Locomotives on the bridge should, he says, be limited to about 18 tons weight, which would strain the bridge in minor parts about the same as Pullman cars weighing 32 tons. Such a locomotive could draw two Pullman cars or two freight cars up the grade of the structure. Mr. Roebling adds that he is convinced from the experience of the past year and a half that, as soon as increased switching facilities are provided in New York, so that three or more cars can be run in a train, the rope traction system on the bridge can not be excelled by any other in respect to regularity, economy, average speed, and number of passengers transported.

AN IMPORTANT IRRIGATION ENTERPRISE.—The irrigating ditch projected to commence near La Grange, on the south side of the Tuolumne river, and conduct the waters of that stream fifteen miles to the plains, from which point it will be distributed over the agricultural sections of that region, promises to be a success. The estimated cost of taking out and delivering the water at the point designated is \$184,000. The canal will be forty feet wide and carry five feet of water. After the canal reaches the plains the cost will be nominal. It is expected the main canal will be 35 to 40 miles in length. Once the water is brought on these plains, Stanislaus county will be equal to any other part of the State.

GUN COTTON FOR STEAM.—An application of gun cotton is said to have been made in such a manner that it will eventually supersede the use of steam for the purposes of light locomotion and driving small machinery. Details of the invention are withheld until a public exhibition of its utility is made.

AN UNDERGROUND SYSTEM OF RAILWAY FOR PARIS.—A Government bill has been presented in the French Chambers for the construction of 25 miles of underground railways in Paris at a cost of 210,000,000 francs, the State guaranteeing 5 per cent.

USEFUL INFORMATION.

HOMOEOPATHIC PERFUMES.—The odoriferous molecule of musk must be incomprehensibly small, when we are told the particles one grain of musk had, in a radius of 90 feet, disengaged in one day. No microscopic power has yet been conceived to enable the human eye to see one of these atoms; yet the organs of smell have the sensitiveness to detect them. We cannot imagine their smallness, as it is stated that the same grain of musk undergoes absolutely no diminution in weight. A single drop of the oil of thyme, ground down with a piece of sugar and a little alcohol, will communicate its odor to 25 gallons of water. Haller kept for 40 years papers perfumed with one grain of ambergris. After this time the odor was as strong as ever. Bordenave has evaluated a molecule of camphor sensible to the smell to 2,262,584,000th of a grain. Boile has observed that one drachm of asafoetida exposed to the open air had lost in six days the eighth part of one grain, from which Keill concludes that in one minute it had lost one 69,120th of a grain.

A PEA SHELLING MACHINE.—A pea-shelling machine has recently been invented, in operation which the peas are placed upon the platform of the machine and fed by hand to a drum through a hopper at the top. They are then submitted to the action of the beaters, which open the pods and allow the peas to fall through the meshes of the wire-cloth. In consequence of the oblique arrangement of the beaters, the pods continue to advance toward the extremity of the drum, where they fall into a chute. The unshelled peas are caught at the upper part of the drum by the rods that project into the interior, and are thus struck by the beaters, so that the shelling is perfect before the peas drop into the box beneath. The results obtained with this machine are remarkable, and its performance is important, since it can do as much work as several hundred women in the same length of time.

TO REMOVE DRY ROT.—A Russian professor has been experimenting, says the *Architect*, on the best way to remove dry rot. He says that a thorough draught will destroy the parasite within 24 hours. If the action of draught be assisted by that of sunlight, a few hours will often suffice to put a stop to further damage. A concentrated solution of common salt is very efficacious, and the stronger it is used the more rapid its action. The action of a concentrated solution of cupric sulphate (blue stone, blue vitriol) is still more energetic and complete than that of common salt. Crude carbolic acid is rapid in its action and cheap, but inconvenient to use. But he considers that the best, cheapest, and most convenient material to employ is the tar obtained when birchwood is distilled for acetic acid: the under surfaces of the flooring are painted with the tar.

SOLUBLE GLASS AS A PRESERVATIVE.—Three coats of soluble glass, each applied at an interval of a day, the *Pottery and Glassware Reporter* says, are sufficient to preserve porous materials indefinitely at a cost of about 15 cents per square yard. When applied upon old materials it is necessary to wash them thoroughly with water first. The degree of concentration of the solutions to be used varies with the materials. For hard stones the solution should mark 7 to 9 degrees Baume; for soft stones with coarse grit, 5 to 7 degrees; for calcareous stones of soft texture, 6 to 7 degrees. The last coating should always be with a dilute solution of 3 to 4 degrees only.

IMPROVING GYPSUM.—It is asserted that gypsum becomes harder by placing it, after calcination, for a few minutes in a mixture of water with eight per cent of sulphuric acid, and then calcining again. We think this quite likely to be so, as gypsum often contains quicklime, which by this treatment is also changed into sulphate or gypsum. Alum is also known to harden plaster casts, and is now proposed to immerse the freshly burnt gypsum in a solution of 10 parts of alum in 90 parts of water, and then to calcine again. Casts made of such plaster can be polished like marble.

TOUGHENED GLASS.—The original method for toughening glass consisted in plunging the vessel while hot in an oil bath heated to 392 deg. F. The glass was thus hardened, but became very brittle. T. Lubisch recommends solutions of starch or gum, heated to 212 deg. F., the glass vessel to be plunged in the liquid while glowing, and before it has lost its redness it is transferred to an oven and allowed gradually to cool down. He claims that his method is much superior to that of the original process.

A GOOD IDEA.—Some one in the London *Field* suggests that if a man wants a carriage or implement photographed so as to make a working copy to scale, all that is necessary is, when the photo is being taken, that a clear and distinct three-foot rule be placed on the carriage; this is photographed along with the carriage, and no matter what the size of the print or negative, will always be a true scale. It enlarges and diminishes in exactly the same proportion as the carriage.

BUTTERNUT WOOD FOR SHOES.—Quits a demand has sprung up for the butternut wood for

making wooden shoes. These shoes are coming into extensive use in breweries and other industrial establishments where the floors are damp. They are much warmer than the best leather soled shoes under such circumstances, and have not the oppressive condensation of moisture characteristic of gum.

IMPROVING COMMERCIAL COPPER.—The French society for the encouragement of natural history has awarded the prize of 1000 francs for the discovery of a useful alloy to M. Marches. The alloy is prepared by mixing three parts of copper with one of manganese, and adding it in small quantities to the molten copper, after refining and just before casting. As copper so treated with manganese is only very slowly acted upon by sea water, it is capable of very important applications.

STEAM PIPE JACKETING.—The Stettin Vulcan Works make use of wool for clothing steam pipes. A lead cylinder is laid around the pipe, and the space between, which is about one and one-half inches, is filled up firmly with wool. This lead cylinder being drawn back, the wool as exposed is tied down with wire, and finally linen is sawed over the whole.

ETCHING OF IRON AND STEEL.—F. Kick, of Paris, with the following mixture: Hydrochloric acid, 1 pint; water, 1 pint; concentrated solution of antimonious chloride, 1 drop. The last ingredient is added to prevent rusting of the etched parts. Soft and fine-grained metal is more easily acted on than any other sorts.

LUBRICANT FOR HEAVY BEARINGS.—The following is said to be a good lubricant for heavy bearings: Dissolve the best of white lead in good machine oil, make it pretty thick, take all the clotty substance away, then add this remainder, and you will find a good lubricant.

A GOOD COATING FOR IRON.—A varnish compound of 120 parts of mercury, 10 parts tin, 20 parts green vitriol, 120 parts water, and 15 parts hydrochloric acid of 1.2 specific gravity, furnishes a good coating for iron exposed to the wet.

CEMENT FOR PETROLEUM CISTERNS.—A useful cement which hardens very quickly, is formed of litharge mixed with glycerine. It may be used for water and steam pipes, as well as for lining cisterns for petroleum oils.

COST OF AN OCEAN STEAMSHIP.—The estimated cost of a new Pacific mail steamship is put at \$750,000.

GOOD HEALTH.

Hay Fever and Its Cure.

Hay fever people will be glad to see the nature and treatment of their complaint described in simple terms, readily understood by every one who comprehends the author's meaning.

These unhappy individuals, according to Dr. Sajous, of Philadelphia, possess, "as a result of heredity or of disease implicating markedly the nervous system, nerve centers which have become abnormally sensitive, and are therefore inordinately influenced by the external elements to which they respond."

As a result of local disease the nasal mucous membrane becomes hyperæsthetic, and transmits to the abnormally sensitive nerve centers the impressions made by the "external irritants" (pollen, etc.), which results in a paroxysm of "hay fever."

These are the three conditions necessary for a paroxysm, and when one is absent, as is the case with the external visitants a portion of the year, and all the year in certain regions, it will not take place. Hence to cure the disease is to render the hyperæsthetic nasal membrane oblivious to the annual visitation of the external cause. The writer maintains that this can be done by cauterizing the hyperæsthetic portions of the nasal membrane, which he has accomplished with pleasing and permanent results by means of the galvano-cautery or acids.

He describes these hyperæsthetic areas as consisting of three—posterior, middle and anterior. The posterior area is implicated when reflex asthma is the most prominent symptom; the anterior, when the head symptoms alone are present; the middle is the starting point of all the symptoms combined.

He recommends that abnormal conditions of the nasal cavities, such as hypertrophies, polypi, exostoses, etc., be eradicated before using the superficial cauterization. The best results are obtained by instituting treatment six weeks at least before the onset of a paroxysm, though it may be conducted during a paroxysm, resulting sometimes in an arrest of it or a beneficial modification. Immunity depends on the thoroughness with which the treatment is conducted.

It would seem, says the *Medical Record*, from the perusal of Dr. Sajous' monograph on the subject, that the hay fever might become unknown, provided its victims would put their hyperæsthetic nasal membranes under the treatment of an adept in rhinology. The banishment of hay fever from the list of diseases would be a boon to all except the hotel keepers of those resorts where, since the "external

irritant" does not lurk in the atmosphere, the cause is removed and a cure is effected.

With the mechanism of the disease still in mind there remains one other method, which will be as much superior to that advanced by Dr. Sajous as his is better than the now prevailing method of changing abode, namely, that of finding a remedy which will set directly upon the abnormally sensitive nerve centers. We commend this to investigators.

What Pneumonia Is.

Pneumonia has already become alarmingly prevalent in this city. Residents, but more especially visitors, in San Francisco, are quite apt to needlessly expose themselves to attacks from this disease, which is quite apt to follow a sudden exposure to cold winds when in a heated state, as after brisk walking, or on emergence from the overheated and vitiated atmosphere of public assembly rooms. In this connection we especially commend the perusal of the following paragraph from an exchange:

Pneumonia is inflammation of the lungs. When the inflammation is on the lining of the chest, it is pleurisy. The two may be combined. Pneumonia is a dangerous disease, and requires prompt action. It is preceded by a chill, from which it is sometimes difficult to restore the natural heat. The chill is followed by a high fever, in which the heart beats rapidly. Chills may come from other causes than pneumonia, but unless sure of the cause and sure that it is not dangerous, it is safe to suspect a coming pneumonia, and to send at once for a physician. On no account attempt to manage the case without one. The disease is too serious to warrant such an attempt. Until he arrives, do what you can to equalize the circulation and temperature. Keep in bed between woolen blankets or sheets, increase the temperature of the room, apply to this affected parts old soft cotton (not linen) cloths wet in hot water, in which has been mixed one-half of a teaspoonful of mustard to a quart of water, and to this apply heat from tins or bottles of hot water or hot bricks. Rubber water bags are best; apply heat in the same way to the feet. Do not increase the quantity of mustard. The object is to excite action in the skin, but to avoid irritation that would hinder or destroy action. As these cool, replace them at once with others, not allowing the temperature to reduce at all. On no account must the patient get out of bed.

For medicine give aconite, four globules, every half hour; this is homoeopathic. When he perspiration returns and the patient can sleep, let him sleep; continue the heat for a time, and when it is reduced let it be done with great care. If the patient needs food let it be of a plain, simple kind. Avoid cold drinks until the natural condition of the skin is restored.

INDUCED NERVOUS CONDITIONS.—Prof. Charcot recognizes the force of the statement made by American investigators, that the nervous symptoms designated "railway spine" would be better called "railway brain." "Those grave and tenacious nervous conditions," says M. Charcot, "which follow upon collisions, and which make it impossible for their victims to pursue for months, or even years, their accustomed occupations, are often no more than hysteria. Hysteria in the male should be known and recognized in legal medicine, since large interests are involved in the matter, and it may come before a tribunal affected by the deeply-rooted prejudices against the word hysteria." Five years ago, when systematic attention was first given to male hysteria, Klein was able to collect but 80 cases of the affection, but Batault has lately brought together a list of 218 cases. M. Charcot says that such cases are not more frequent than formerly, but that the affection has become better studied and more easily recognized.—*Progress Medical*.

SAFE FROM DISEASE.—There are certain constitutions which do not take disease readily. Such a case was Capt. Rackliff, who lived to be over 180 years old. He had been exposed on shipboard to yellow fever and other infectious diseases, and had bent over sick men and taken their breath, had washed and prepared them for their watery burial after death, but never incurred any disorder. The scarlet fever, the plague, diphtheria and other epidemics discriminated and turned aside mysteriously from him. This is the way it should and might be with thousands of the human race if only the laws of health were properly understood and observed. The human body was perfect in the original make up, but it has sadly degenerated by heredity and by personal neglect. Man was intended to, and might, die only of old age.

WHAT ARE THE CAUSES OF NERVOUSNESS?—It would be difficult to answer this question. There are too many of them. This may be said, however, that as a rule nervousness and anemia go together. If there is too little blood circulating in the body and the brain is large and active, nervousness will be sure to be present. So we may say that the best preventive is to improve the character and quality of the blood. When this is deficient, the nervous condition is not kept up to a high standard, but becomes weakened and lowered. This is all there is of it.

PEACH LEAVES pounded to a pulp and applied to a bruise or wound from a rusty nail, or a simple cut, will give immediate relief.

MINING SUMMARY.

The following is mostly condensed from journals published in the interior, in proximity to the mines mentioned.

CALIFORNIA.

Amador.

WILL START.—*Amador Sentinel*, Sept. 9: It can now be regarded as certain that the Kennedy mine will soon start. Breece & Co. have struck a five-foot ledge of rock that is claimed to be very rich in the Black Hills. About 40 men have been let out at the Empire mine, Plymouth, on account of the shortness of water. There is a rumor that operations will soon be commenced on the Bright mine, on Schrober's hill. W. E. Stewart has sold the Light-house mine to Mr. Flagg for \$2000. Mr. Flagg will work the mine on a small scale at first, until he determines the exact character of the purchase. It is stated that the Alpine mine, of Plymouth, which has lain idle for many years, is to be started in operation shortly. New York capital has been interested. The name of the Tellurium mine, of Pine Grove, has been changed to the San Joaquin. Fifty-five feet of the old shaft, or rather the place where it was, has been re timbered. It is expected to continue this work to a depth of 300 feet. The calculation is to rig up new hoisting works as soon as it can be got at. Julius Leszynsky has made an agreement with the Mahoney Mining Company by which he will commence work in that mine within three months and within four thereafter spend \$10,000 in developing the same. He then has the privilege of surrendering the mine free of encumbrances. Should he choose to go on he is to spend \$25,000 more. After which he is to receive a deed to one-half the mine. Should it take less than \$35,000 to put the mine on a paying basis, the difference between that amount and the amount actually expended is to go into a common pot. This agreement has the appearance of being genuine, and it is probable that work in accordance with its provisions will shortly commence.

IDLE.—*Amador Ledger*, September 12: The Hadley mine, above Volcano, is idle. A large body of water was encountered in sinking, which was too much for the present pumping facilities to control. Work has therefore been suspended until next spring, when better pumping machinery will be secured. The Gillick mine, near Volcano, continues to turn out immensely rich ore, which is accumulating on the dump, no crushing having been made as yet. The claim is owned by T. Gillick and Dr. Phillips, both working miners. They are crosscutting at a depth of 80 feet, and have struck two quartz ledges, one from two to four feet wide, the other about 2½ feet, both of free milling rock of very high grade. The Empire mill at Plymouth is kept running only during night time, owing to the scarcity of water. It is supplied by the company's ditch, conveying water from the Consumes river. About 40 miners have been discharged, on account of the works being reduced to half-time. W. E. Stewart has sold the Light-house mine, situated near Butte City, to T. E. Flagg for \$2000. The new proprietor intends to proceed to develop it at once. Five more stamps are to be added to the mill, making 10 stamps in all. The Zeife mill was stopped Monday to enable connection to be made with the new pipe recently laid from the reservoir to the mill. The stamps were in motion again early Tuesday morning.

Calaveras.

GLENCOE.—The arrival of E. A. Hanke, of San Francisco, has caused a general stir in our local mining circles. The gentleman purchased P. Corcoran's one-third interest in the Gold State Mining Company, and has immediately assumed superintendency. By the direction of the company a crew of miners have been put to work to find the most feasible points for the extraction of paying ores. The outlook is of the finest and the company has the community's most cordial support. The recent developments in the Hidden Treasure mine are of a highly encouraging nature, and have given new life to mining projects in this locality. Rock having been taken from this mine that shows the auriferous metal in abundance, and practical assays attest its running over \$200 per ton free milling gold, \$75,000 is the asking price of a one-fourth interest. The Sierra Queen is yielding an abundance of \$50 rock from a ledge without limit. The facilities for extraction are first-class. Donnelly & Young are being well rewarded for their tedious labors in "bottoming" Old Mosquito Gulch near its discharge into the Mokelumne river. They have reached the bedrock from which they are taking a liberal amount of the yellow metal. T. J. Posey has arrived from the Bay City and resumed operations on the Craig and Posey tunnel. He reports his intention to push the tunnel ahead 200 feet. At this juncture the erection of a five-stamp mill will be in order to grind the quartz. Glencoe is on the jagged edge of a mining boom that soon will set her afloat.

THE ORO PLATA.—*Cor. Calaveras Citizen*: The Oro Plata mill and mine now in such successful operation will soon have to close down on account of the scarcity of water. The extreme hot weather of the past several weeks has been a severe draft on the water supply in the reservoir, which is now nearly exhausted. The meager fall of snow in the mountains last winter is another cause of the present deficiency of the water supply, for as early as the first of July the loss by evaporation was greater than the river or springs could keep up. The water company have ample water shed and abundant facilities for a largely increased water capacity, and doubtless will in the near future utilize the depressions or valleys that are almost natural reservoirs in near proximity to the large reservoir, and thus assuring an abundant supply of water the driest of seasons. The Oro Plata Mining Company is a permanent institution and is of incalculable value to this vicinity. Thousands of dollars have been unsparingly expended in practically demonstrating the feasibility of erecting reduction works to work low grade ores at a figure so low as to yield a profit, and I venture the opinion that at no mill in this State can ore be extracted and milled any lower than at these works. The past week the company, under Supt. Morse's guidance, one of the Tustine pulverizers, of which the company have four, has been altered to wet crush, and during the week was running on hard ore. It works splendidly with an increased capacity over dry crushing, fulfilling the

expectations of Supt. Morse, who was sanguine of carrying out successfully this end in view. When the rainy season sets in, giving assurance of an abundant water supply, the remaining three pulverizers will be correspondingly altered, which, in connection with the 15-stamp battery, will be equal to a 60-stamp mill, the bullion shipments then largely increased will not only redound to the credit of the management, but will mark an era of healthy improvement in mining in this district not witnessed heretofore. The ore body is still as promising and apparently as inexhaustible as ever, and doubtless will richly reward the perseverance, the time, and money spent to develop it.

Inyo.

PROSPECTING.—*Independent*, Sept. 12: The process of concentrating ores lately introduced at the Maxim mill, is already giving quite a stimulus to prospecting along the Inyo range. A few days ago Joe Groves brought in some ore from prospects found by him in Mazurka canyon, that would pay well to concentrate. This ore is found near Independence Station on the C. & C. railroad, and if an ore body is found will be very convenient to get to the mill.

WAUCOBA MINES.—Last week Albert Bierstadt left San Francisco for New York. It is his intention to return to Independence about six weeks hence, when he will begin work on mines at Waucoba. The movement is the result of investigations made by Mr. Bierstadt and party during their visit to this region a few weeks ago.

Mariposa.

THE FRANCIS MINE.—*Mariposa Herald*: John Mitchell of the Francis mine, was in Marysville Wednesday, and from him we learn that everything is progressing favorably at this mine. The mill will be in running order in two weeks, and would have been ready sooner but a defect was discovered in the boiler that made it necessary to send to San Francisco for a new one. Two tunnels in the Francis are being cleared out, and as soon as the face of the drifts are reached the work of extracting the ore will be commenced. The same company are sinking a shaft on the Moore Hill mine, which is located about three-quarters of a mile down the creek from the Francis, and the prospects are most favorable. Should this mine give promise of permanency a mill will also be put on it. Only 14 men are now employed by the company, but if they make this venture pay they will go largely into the mining business in this county.

Placer.

THE BOULDER.—*Placer Herald*, Sept. 12: Last week we mentioned that the Boulder mine, near Ophir, was about to be started up by a San Francisco company. Work has already commenced, and from the improvements undertaken the managers are evidently well backed, and have full confidence in their undertaking. They are laying out to put up hoisting works, a mill, a boarding house, and all necessary appurtenances to a first-class mine. This vein has yielded well in the past, and worked economically and systematically, it ought to, and no doubt will, pay.

THE BLUE WING.—This mine is owned by the Walker Brothers, of Salt Lake, and is at present worked by Messrs. William Kitto & Co., who are taking out some very good ore from the mine. The men at work there are pushing developments at the bottom of the mine, and as they have a 12-months' lease of the property, they will undoubtedly do well. The Blue Wing is located right in the heart of Walkerville town.

THE RISING STAR mine is looking very well and the usual quantity of ore is being extracted. During the past week connection has been made with the winze running from the 400 to the 500-foot level on the vein. When the Rising Star is cleared of the litigation hanging over it, which now encumbers it materially, it will be one of the most valuable properties in the camp.

THE MOULTON.—Superintendent Clark informs us that the Moulton mine is looking about as usual. The usual quantity of ore is being produced, with no perceptible difference in the supply. The work of sinking the main shaft below the 500-foot level has been commenced, and no trouble is experienced with water. The winze on the 500-foot level is going down ahead of the shaft. Everything in and around the mine and mill is working in a very satisfactory manner.

MINOR NOTES.—The work of sinking the Anaconda shaft below the 900-foot level is still in progress. The Anaconda and St. Lawrence mines look splendid. Superintendent Miller, of the Montana Copper Works informed our reporter yesterday that the mines over which he superintends never looked better than they do at present. The Parrot mine is holding its own in fine shape. Over 300 tons of ore are taken out daily, and yet there is enough mineral in sight to keep this up for nearly a year and a half. The shaft is going down as rapidly as possible. The Parrot is a grand property.

OPHIR ITEMS.—*Placer Argus*, Sept. 12: The Boulder mine near Ophir is about to be re-opened and thoroughly prospected; in fact work was begun on it Monday morning. Sam Howe, of Oakland, an experienced miner, is the superintendent. Four men are at work in the Gold Blossom mine. They are working for the company under Mr. Burlingame. They are reported to be doing first rate.

Plumas.

PRATTVILLE.—*Cor. Greenville Bulletin*, Sept. 12: We made a visit to the Savercool mine lately. Everything is in fine shape at the mill, under the ward of Alex. Cameron; ready to start up whenever that long-wished-for time may arrive. That is a fine property to remain idle so long. The reports of some of the "finds" over on the Big Flat continue current. Those who have struck the pay are very quiet as to both the extent and richness of the "finds." Hobart is working some eight men at Sunnyside, and, we are pleased to hear, is receiving good pay. Water is so scarce that a good many men are not at work at their diggings, or are doing but little. The Dutch Hill ditch has been entirely dry on its lower course for some time. The supply of water in the feeders is so short that a sufficient head of water cannot be gotten to run through the length of the ditch.

Sierra.

THE ALASKA MINE.—*North San Juan Times*, Sept. 12: The Alaska mine at Pike City, Sierra county, 12 miles from this place, is turning out gold in immense quantities, and the deeper the earth is

penetrated the richer the rock becomes. To better facilitate the production of the precious ore the Alaska Company are about adding 20 stamps to their mill and also another 7000-pound pump. The machinery is now in transit and has been passing through this place for a week past. The pump now in use is requisite to keep the mine clear of water, and the new one is designed for use in the event the present one gives out of needs repairing. The object is to prevent the stoppage of the mine. Col. Bates, the manager of the Alaska, is doing splendid work. He has the mine in first-class order and works it economically. The Colonel is of the opinion that the Alaska may be ranked among the best mines in the State, and we think so too.

NIGGER CANYON.—*Mt. Messenger*, Sept. 12: Mr. Antone Demartini informs us that work is progressing rapidly on the wagon road leading to his quartz ledge in the above-named canyon, about 40 men being employed on the road, the millsite and the mine. The wagon road leaves the river at Charcoal Ranch and is about three miles long with an easy grade. The mill will be in two batteries of four stamps each, run by a Pelton wheel three feet in diameter under about 130 feet pressure. J. W. Brown is making 200 feet of 15-inch pipe for this mine. The supply of water at present is about 50 inches, which is ample to run all the machinery that will ever be needed. He has two ledges, one a very large one and the other about 2½ feet wide. The most work has been done on the small one, the rock from which is very rich, it being almost entirely black sulphuretted ore, easily worked. All parts of the mill are already completed, ready to put together as soon as the road is done. Four capitalists from San Francisco are visiting the Young America quartz mine, Sierra City, and inspecting the Phoenix and other quartz properties, with a view of purchasing. Flattering prospects have been discovered on the Florence quartz ledge. For a distance of 1800 feet the ledge has been traced, and where sunk upon averages five feet in width and prospects exceedingly well. Bald Mountain Extension Co., Forest City, cleaned up last Sunday 206 ounces. The pay channel is 140 feet wide and well defined. The gravel averages about \$5 per carload. Regular monthly dividends will soon be declared. Work is progressing rapidly on the American Hill quartz mill, and a large part of the machinery is already on the ground. A large force of men has been busy for the past two months making the needed improvements. The mill will undoubtedly be in running order long before winter sets in. The Young America Co. had a very satisfactory clean-up on Monday, September 7th, after 17 days' run, the ore averaging \$70 per ton. Their mine looks fine. A dividend will be declared on the first run. Within four or five weeks 20 stamps will be running and the business and assay offices will be completed in eight or ten days. Mr. Van Slyke has received another iron hoisting tub for his Butcher Ranch quartz mine. We understand that he has his whim so arranged as to hoist rock from two shafts about 100 feet apart. The mine is paying well.

Shasta.

COPPER CITY.—*Redding Independent*, Sept. 12: The Winthrop mill began operations Tuesday with two furnaces. On Monday they will start in full blast, working from twenty to twenty-five men and running night and day, putting through from 10 to 12 tons of ore. A new strike in the mine shows rock that will assay as high as \$800 to the ton. Dr. Graham and Newt. Greer have discovered a ledge of coal four to six feet wide, just back of the Winthrop mill. John Lowden has secured a half interest in a rich mine discovered by an impetuous prospector about four miles from Redding near Rock creek. The surface indications appear to be as rich as the Shearer mine, and great clumps of rock show seams of almost solid gold. That it is immensely rich for a short distance down there is no question.

THE SHASTA BAR TUNNEL.—From Mr. Ed. Jones, who was engaged on the Shasta Bar tunnel, on the Upper Sacramento, we learn that the tunnel is now completed, and the company are now engaged in building a dam on the river to turn the water into the tunnel. When this is done the bed of the river for a considerable distance will be drained, and it is this river-bed that the company propose to work for gold. It is supposed, by the prospects along its banks, to be very rich, and it is to be hoped that it will prove so, and richly repay the company for their expenditure, but of course it cannot be known till it is tried. The running of the tunnel, for which Mr. Ed. Hume was the contractor, will cost some \$19,000, and the dam will cost \$7000 more, making an expenditure of at least \$26,000 to test the scheme. If it proves a success it will be a big thing for its owners. The water will be turned into the tunnel in a few days, and then it will soon be known whether it "pays big" or not.

MILL.—*Shasta Co. Democrat*, Sept. 12: Hon. Reuben Clark started his re-stamp quartz mill on the Harrison mine yesterday. All the machinery works well. Since Mr. Clark took hold on his property he has taken out fully 400 tons of good ore. The new Copper City mill and furnaces on the Winthrop mine started up the latter part of last week. Everything about the mine is working like a charm, and there is a big body of high grade ore in sight, assays from which run up as high as \$6000 to the ton. Last week TenEick, Haskell & Co., who recently made the rich strike on Slickrock, took up to the mine a small hand crusher with which they will test the milling capacity of their rock. The boys are hard at work sinking on the vein, and the prospects for a good mine are most flattering. From Mr. Stickley, who has been up at the T Shasta tunnel on the Sacramento, we learn that the tunnel has been entirely completed, and the dam will be finished this week. Mining operations on the claim will now be commenced soon. The prospects are that the company will realize big money on this investment. Mr. Porter, a young mining man of San Francisco, arrived on the train last Friday evening and, in company with a Mr. Alexander, Saturday morning went up on Salt creek and located a promising gold-bearing quartz claim, naming it the Shasta Prince. The vein appears to be a strong one, the quartz blue, highly mineralized, with rich sulphurets, and altogether greatly resembles the rich ore in the Scheerer & Rattler mine. George McDaniels, Anson Seabring, Mr. Speak and another gentleman whose name we failed to learn, about three weeks ago made a discovery of a quartz vein about three miles southeast of town that promises to develop into a real bonanza. They have sunk on it about 10 feet and at that depth

the vein is strong 12 feet wide between walls. The quartz is of a deep blue cast, carries spar, and also a big per cent of sulphurets, which, when roasted and tested with acids, salt and potassium, yields big results in fine gold, but not a color will it yield by the simple mortar and pan test. The frequent results of the crude acid and roasting test has led the boys to believe that they have a big piece of mining property, and we sincerely hope they have. Monday they shipped a large sample to Thos. Price to be assayed and analyzed.

Trinity.

A BRIGHT OUTLOOK.—*Journal*: This week in conversation with two of the owners of the North Star mine, in the East Fork Mining District, the *Journal* reporter was enlightened on the recent doings at that very promising mine—one of the best in the district—which is now looking better than ever. On the dump now lie over 140 tons of splendide ore. There are five men at work taking out more ore, cutting timbers and rushing things right along in a ship-shape manner. The company have five locations: North Star (the boss, on which the bulk of the work is now being done) which is from 2 to 5 feet in width; Comet, Linnie and Freshwater, which show up quite handsomely; and last but not least the Little Chief, a small ledge from 12 to 14 inches wide, which will turn out a chief in the way of producing the "precious," as recent prospects prove very emphatically that it is a veritable bonanza. The company held a meeting in Weaverville this week to make final arrangement for the purchase of a Hammond 5-stamp mill which is manufactured at the Napa City Foundry. The meeting terminated favorably and the order for the mill is now at the foundry, and will be shipped immediately. The mill will arrive at the mine in about two weeks, and in about a month will be grinding out money for the owners. The North Star boys are as happy as a clam in high tide.

NEW MILL FOR DEADWOOD.—The new Huntington mill which will be erected on the Vermont Mine, in Deadwood district, by Mr. A. P. Minear, has arrived and is now being put into position. It will be put in motion next week, when good reports may be expected.

Tuolumne.

LOCAL MINING NOTES.—*Union Democrat*, Sept. 12: The Oakland mine has hung up its stamps for want of water. Sinking is being steadily prosecuted on the Jumper mine at Quartz Mountain. The Stanislaus River Mining Company have stripped the gravel down to bedrock, and are washing away night and day. A. E. Walton of San Francisco went up to look at the Riverside mine Thursday. It is believed that there is a movement on foot to commence extensive operations on that mine shortly. Quite a number of parties have taken advantage of the low water to work the bars in the Tuolumne river. Several gangs of men are at work in the river between Jacksonville and Red Mountain Bar. W. S. Fielding is pushing operations in a systematic manner on the Hogle & Dagnar mine at Sugar Pine. The property is developing finely. A new boarding house has been erected for the accommodation of the miners. Gus Wiedekind is working a streak of gravel at Pine Log, and appears to be making a good thing of it. He has been taking out nuggets weighing from one to three ounces. The tramway and ore bins at the Buchanan mine have been completed, and the work of erecting the mill will soon commence. The ditch is progressing well along, and the saw-mill is busy cutting lumber for the new works. About 100,000 feet has already been cut. The mine is in splendid working shape. A large steam pump has been put in the main shaft of the Lamphier to drain the lower levels of the increased flow of water. The scarcity of water which has caused the stoppage of so many mills does not interfere with the Lamphier, it being run by steam power. It is pounding away night and day on rock from the South shaft. Judge Clark is pushing things at the North Star mine. The new hoisting works are in complete working order, and are in steady operation. The mine is being developed by night and day shifts. It was intended to begin ore crushing about the middle of the month, but the failure of the water supply will delay milling operations for some weeks yet. Glowing reports continue to come from the Dead Horse mine at Summerville. Explorations have developed the existence of an extensive body of high grade quartz. The rock while making a rich return by free milling process, contains a heavy percentage of high grade sulphurets. Messrs. Hayward & Hobart, who own the property, will doubtless soon put up reduction works. R. A. Sawyer of Groveland was in Sonora last Sunday. He is the owner of some very promising mining property on Mt. Gibbs near Tioga, which he has been developing this summer. He exhibited some extraordinary rich silver ore taken from one of his mines. He has sunk down on his lead in seven places, and everywhere finds an abundance of rock of the character shown. He says the lead averages about 12 feet in width. He is now in communication with capitalists who desire to purchase the property. Gust Jackson, one of the owners of the Forty-nine mine near Don Pedro's Bar, was in town Tuesday. The mine, he says, is looking very well, and is being developed by a force of five men. They are now down on the vein 135 feet, but are running a tunnel to tap it at a still greater depth. The vein wherever explored averages about four feet in width of good milling quartz. The rock contains a heavy percentage of sulphurets. Colonel Whitlock and Professor Wilbur of Chicago, Col. C. W. Tozer, owner of the Potter mine at Angels' camp, and W. G. Long, visited the Willietta mine at Jacksonville Wednesday for the purpose of making an examination of the property. Negotiations are now being conducted with a view to selling the mine to an Eastern company, and the gentlemen named were viewing the property in the interest of the proposed purchasers. Should the pending sale be concluded, an enterprise would be inaugurated that would be of enormous benefit to Tuolumne county, and would attract attention to the vast capabilities of the great mother lode on which the Willietta is located.

FROM GROVELAND.—*Cor. Tuolumne Independent*, Sept. 12: The mill on the Kanaka mine is now in running order, and is very much better than the Sweepstakes mill the owners first built. Mr. Chas. Schneider, one of the pioneer quartz miners and millmen of this coast, has remodeled the mill, and put in one of his patent aprons, which is the very perfection of a gold-saver. Mr. Schneider was, in early days, one of the firm of Waas, Molitor & Co., who were assayers and coiners of \$50 slugs, and

owned the mines on the Mariposa Estate until Gen. Fremont lawed them out of their property. Count Wnas, and Messrs. Molitor, Capt. Eusebi Kustel, were civil engineers and officers on the staff of Kossuth, and fled to this country for political reasons. Some of these celebrated Hungarians had been gold miners in their own country, and on their arrival here engaged in the same business, and have had much to do with the introduction of gold mining apparatus on this coast—they were, in fact, the fathers of the present gold quartz stamp mills. The original builders of the Kanaka mill somehow got the cam-shaft on the feed side, instead of on the discharge side, and this is the only defect in the mill; but Mr. Schneider thinks he can remedy this, without tearing up the whole battery-frame, in case the mill does not work well in its present shape.

NEVADA.

Washoe District.

HALE AND NORCROSS.—*Enterprise*, Sept. 12: The station from the east side of the deep winze for the 3100 level being fully opened and completed, the main drift has been swung around due south instead of following a southeast course, as was at first contemplated. This is in order to connect more speedily and directly with the main drift coming from the Combination shaft, which has already gone west 130 feet and is getting into the eastern outskirts of the great ore channel. For this reason it was necessary to make the course of the drift from the winze directly south, following the vein. As before stated, the face of the drift is in ore, and at the south side of the station, close to the winze another drift has been started swinging sharply around to the westward. This will form a west crosscut, and is intended to explore the vein from the deep winze to the west wall. In passing out of the station from the winze this drift cut through some very good ore adding much to the ore possibilities of the south drift. These two drifts south and west will be watched with intense interest during the next few days by all concerned in the bonanza promise and success of the Hale and Norcross mine. Never was the management of any mine more squarely in earnest than in this, or more evidently desirous of developing a genuine bonanza.

CON. CALIFORNIA AND VIRGINIA.—From the Jones lease section, above the 1550 level, about 50 tons per day continue to be extracted, which is shipped to the Eureka mill, on the Carson river, for reduction. This ore assays about \$12 per ton. From the 1750 level, about 130 tons per day are extracted on company account, assaying about \$14 per ton. This is shipped to the Morgan mill for reduction. The Morgan mill, running by steam, is not dependent upon the Carson river for motive power. The northeast drift on the 1650 level has been extended 45 feet during the past week, making a total distance of 170 feet.

CHOLLAR.—The main west drift from the Combination shaft, 3100 level, has reached a distance of 130 feet, and the face is in the east quartz vein of the ledge. It will probably be through it to-day and into the clay seam which lies between that and the main vein. It will be continued into the main vein to a suitable point for a lateral drift north to connect with the lateral drift coming south from the Hale and Norcross deep winze. After this connection is made, a good drift of air will be secured, and the main west drift will be continued to the west wall and a south lateral drift be run into the Chollar ground.

SIERRA NEVADA.—On the 550 level the main west crosscut has been extended 36 feet during the week, making a total length of 236 feet. The material in the face is very hard porphyry, with streaks of clay and quartz, and it is not quite so dry as heretofore, considerable dampness being apparent, almost amounting to a seepage of water. This drift is heading toward a very favorable quarter for ore development and a material change for the better may be looked for at any time.

MEXICAN.—On the 500 level the middle crosscut east is being pushed ahead, and is now about 140 feet in length, running in heavy wet clay, porphyry and quartz. A strong flow of water continues coming from the crosscut west on this level.

CROWNS POINT.—The machinery repairs are about completed, and some little prospecting work is being done in both this and the Belcher. The repairs to the Mexican mill are also completed, the dam and flume are in substantial order, and there is water enough in the river to run about half the stamps. It is stated that quite a number of miners are to be put to work shortly in both the mines, extracting some of the best of the low grade ore for milling.

OPHIR.—The repairs to the old Mexican shaft being completed, a station has been opened at the 350 level for a drift west for the old workings in the ore vein, which lie about 60 feet west from the shaft. Considerable good ore was left at that point in years past, which can probably be made to pay under the present cheaper and more advantageous system of working.

GOULD AND CURRY.—West crosscut No. 1 on the 1000 level has been extended 43 feet during the week, making a total length of 341 feet. The material in the face continues to be vein porphyry, clay and quartz, showing no change since last report.

UNION CONSOLIDATED.—The main lateral drift north has reached the Sierra Nevada south line and is in barren quartz and porphyry. It is proposed to run a crosscut west from this main drift in Union ground.

YELLOW JACKET.—The old workings from the 1300 up to the 400 level continue their regular yield, keeping a large force of men employed, and the Brunswick mill, on the Carson river, running to its full capacity.

ALTA.—The main drift west on the 700 level is making excellent progress in very hard rock, and has attained a distance of nearly 140 feet from the main north lateral drift.

BEST AND BELCHER.—West crosscut No. 2 on the 1,000 level has been extended 45 feet during the week, making a total length of 185 feet. Face in vein porphyry, quartz and clay.

American District.

REVIVAL.—*Silver State*, September 12: There is said to be quite a mining excitement in what was known in early days as American district. This district is situated on the east side of the Lower Humboldt range, about 20 miles south of Unionville. The mine were never prospected to any extent, and the district was abandoned years ago. Recently L. F. Dunn discovered a large lead there, which contains rich ore and promises to be a valuable mine. Besides this, placer mines have been discovered in the banks along the creek and several claims have been located. Gold is found in all the canyons of the Humboldt range, but none of the placers have been worked to any extent except Spring Valley, which is a few miles north of American Canyon. The Spring Valley mines, which have been principally worked by Chinese, have produced at least a million dollars in gold dust.

Burl District.

MINING BOOM.—*Eureka Sentinel*, Sept. 12: There is, according to the statement of ex-Assessor H. V. Mundel, of Elko county, quite a mining boom in Burl district, in that county. All the old locations have been relocated, and Walker Bros., from Salt Lake, and other parties from the East have a considerable force of men working in the different locations. Walker Bros. will put on an additional force of 20 men.

Eureka District.

TUNNEL.—Messrs. McEwen and Addison, tributaries in the Eureka tunnel, are extracting some very rich ore from a point 1100 feet in from the mouth and immediately above the roof of the main tunnel. Mr. Addison has been one of the most fortunate tributaries that ever worked in the property, and by those who have seen his new "find" it is believed that it will lead to a chamber of ore equally as large as the famous one that bears his name.

Patterson District.

AT WORK.—Harvey Carpenter came in from his ranch in Lincoln county Sunday night. He reports the miners at work on Patterson mountain, of which mention has been made several times in these columns, doing well. They are extracting some rich ore, which they intend to ship at an early day to either Taylor or Salt Lake for reduction. Their vein of mineral is narrow, but they have faith in its widening out as depth is attained.

Telephones District.

A NEW MINING REGION.—*Tuscarora Times-Review*, Sept. 11: Mr. J. W. McDonald came in last evening from Telephone, a lately organized district eight miles from Mountain City. The new district was organized at a miners' meeting held on the 4th inst. The boundaries are as follows: On the north by Hicks' district; on the south by Alleghany creek. The east and west boundaries are 2½ miles respectively from the Telephone mine. J. W. McDonald was elected Recorder. Mr. McDonald has been working the Telephone since the first of May, and has recently struck the main ledge from which he is extracting a considerable amount of rich ore. Mike Enright, an old Tuscarora miner, has located the southern extension, which is likely to develop as favorably as has the original location. Mr. McDonald intends building a couple of cabins, laying in a supply of provisions and vigorously prosecuting work on the Telephone during the winter.

Willow Creek District.

THE WILD DEER MINE.—*Silver State*, Sept. 11: Gilbert Ross, of Dun Glen, returned yesterday from a visit to the Willow creek mines. He says the Wild Deer the only mine in the district except the Ohio on which much work has been done is opened systematically and shows a good vein of fair ore. The owners are preparing to make another run with the mill and they have ore enough in sight to keep it running some time.

ARIZONA.

GLOBE DISTRICT ITEMS.—*Silver Bell*, Sept. 7: The Miami mill is running on Red Cloud and Cotton Tail ore. E. S. Spencer is at work on his placer claim in Lost Gulch. Simon Billings and Ben Fox have a lease on the Davy Crockett mine. Kingsbury has struck some very rich ore on the Eureka mine, Lost Gulch. Penrod and Jackson are still at work on the Talk mine at Rambos camp. The Letcher Bros. and F. Knapp have commenced work on the Centennial mine No. 2. Ed. Lidolph & Co. are fitting up the Isabella mill for the purpose of working the ore they last mined from the Golden Eagle. Johnnie Koons sold the extension of the Gibson mine on Pinal mountain to Fred Oates last week. The ore prospects well in gold. Tidwell & Coplin have leased Mike Whalen's mine near the Irene springs, and have four men at work on it and are taking out some very good ore. Frank Bissig, Harry Hancock and Tommy Morrell have leased the Rescue mine from L. J. Webster and have commenced work on the west tunnel. Billy Sylvester is still driving a tunnel on his copper claim. He is now in about 75 feet and from all indications is liable to have a very large mine; it is situated between the Buffalo and Takoma mines.

ALASKA.

THE DOUGLAS ISLAND MINES.—*San Francisco Examiner*, Sept. 15: Alaska mining interests are monstrous resources yet to be developed. The country, however, is no place for poor men, or men of moderate means. M. de Porte has spent three years in Alaska, and has come directly from the Treadwell mine, on Douglas island, in which Senator Jones holds a large interest. The Senator is now at the mine, having gone up some weeks since. "The discovery of gold," says M. de Porte, "is in its infancy, and I believe the best ledges are not yet known. But it requires money, and lots of it, to open them up. The mining must be done on a grand scale. I think the Treadwell mine, with its new 20-stamp mill and improved facilities for reducing the sulphurets, will pay \$100,000 per month. The ledge is 600 feet wide, and for free gold alone pays about \$10 to \$12 per ton. The sulphurets will pay about \$100 per ton. The mine is situated almost at the water's edge, and steamers can run right up to the mill. A tunnel has been run under the ledge into the hill for 560 feet, and a shaft sunk from the top to the tunnel. The quartz is located at the top of the shaft, and the broken rock is thrown down the shaft and is run out through the tunnel to the mill. The mill is consequently run at a comparatively small expense. It is now being run night and day employing a force of about 100 men, of whom only 15 are white men, the rest being Indians and Chinamen." Prospectors are discovering ledges in the vicinity every day, but they are practically worthless

unless one has a large capital to work them. This same Douglas island is fairly seamed with ledges. The water supply at the island is controlled, however, by the Treadwell company. In the mountains, back of Juneau, which is on the mainland, about three miles from Douglas island, are several rich ledges.

COLORADO.

CARBON.—*Boulder News*, Sept. 11: The lessees on the Silver Star lode have struck it rich. Two men working on pay keep three men sorting and passing dirt. The ore averages \$200 per ton. The contractors are not doing so well.

SPRINGDALE.—This usually quiet camp has been unusually quiet of late, and items of interest to the general public are remarkably scarce. There is some little mining work going on, but in most of the mines there is little being done. Mr. C. V. Clark, who is working on the Rip Van Dam tunnel, under lease, has made what may prove to be a valuable strike of ore. He began work a few days since at the place in the long tunnel where some \$2000 worth of ore was taken out by W. R. Lafourcade; and soon uncovered a streak of exceedingly rich ore. Mr. Clark intends to raise through to the surface, and as he has found the same kind of ore on the surface, it is highly probable that the intermediate ground will pay well for stoping.

IDAHO.

OLD OWYHEE.—*Wood River Times*, September 7: "Joe" Lennon, an old mining and millman, well known throughout the mining States and Territories, came in to-day to look after some of his mining interests in the Lost River region. He will probably go out to that section to-morrow, and return here in about two weeks, after which he will go back to Silver City, Owyhee, where he has an important sale pending. Mr. Lennon says that General Cunningham, who has leased the Poorman mine, is doing well, though it is too soon yet to ascertain results. He is about to ship two lots of 60 or 70 tons of "stull ore" to two mills for a test, and if the result is satisfactory, at least one mill thereafter can be kept going—for a while at least. General Cunningham is working to men. P. A. Reagan's brother, who has the run of the Oro Fino, has uncovered from \$50,000 to \$70,000 worth of ore by putting about \$2000 worth of work on the property. He will do well. Other abandoned properties are being looked into, and Mr. Lennon says that the outlook for old Owyhee is very good.

THE NEW DISTRICT.—R. J. McPhee has returned from Alton district, to winter in this region, with his family. He reports quite a number of prospectors in the new district, who have discovered very promising veins of milling ore of a high grade. The Cleveland, the mine upon which the most work has been done, shows at least \$50,000 on the croppings, of chloride and sulphurets ores. The formation is a micaceous granite of a soft character, easily drilled and good blasting. The district is but 20 miles in a southeasterly direction from the old Warrens diggings. Water, wood, mining and building timber and ore being abundant, the district has every requirement for prosperity except milling facilities. There is therefore a good opportunity for practical millmen who are looking for favorable locations. Mr. McPhee states that his company intends to resume operations there as early as practicable next spring, to push developments. He will also either take in a small mill to test the ore, or ship a trial lot or two either to Ketchum or Weiser.

MONTANA.

THE ALICE.—*Butte Miner*, Sept. 9: The new hoisting machinery at the Alice mine is working and runs as smoothly as any hoisting engine ever put in action. The work of raising the hoisting works and putting on the new roof has been commenced, and will be pushed to a completion as rapidly as possible. The Alice mine never looked better than it does at present. The stopes on the 300, 400 and 600-foot levels are looking unusually well and are producing the usual quantity of ore. The south crosscut on the 800-foot level is in 80 feet from the shaft, and has to be carried in 100 feet more before the vein is encountered. The north crosscut on the same level is in 60 feet, and will have to be driven 150 feet more before the ledge is cut. In about two weeks the new double-deck cages will be in operation at the Alice. The two mills are working to their full capacity, and everything is running in a highly satisfactory manner. The mills produced over \$100,000 worth of bullion in July. The affairs of the Alice Company were never in a better condition than they are at present, and Superintendent Hall thinks the company have many long years of prosperity before them.

MAGNA CHARTA.—This mine looks exceptionally well, in fact better than it ever did. The stopes and drifts on the 100, 200 and 300-foot levels are looking grand, and the usual quantity of ore is being extracted from these points. The recent strike in the 300-foot level is extending east and is improving in size and in the quality of its ore as it goes east. The 400, 500 and 600-foot levels are being opened up for work. It will be a long time, however, before stoping will be started at these points, owing to the fact of there being so much ore in sight on the upper levels. The work of cutting the south station and running the north crosscut on the 700-foot level, is going bravely on. The Alice Company have a very valuable property in the Magna Charta mine.

THE NEW CONCENTRATOR.—*Butte Town Talk*, Sept. 9: The mason work for the new Liquidator concentrator, near Meaderville, has been completed, and a large force of men is now engaged in putting up the machinery and erecting the building. The works when completed will be first-class in every respect and of a capacity of about 150 tons daily. The Liquidator, under the able management of Wm. McDermott, has been thoroughly opened up and developed, and they now have several thousands tons of ore in sight. It is one of the best properties in the camp, and will add materially to our bullion output when the new works are completed, which will be in about 30 days.

BIG CLEAN-UP.—*Helena Independent*, Sept. 9: The Glover mining company yesterday evening deposited at the First National bank in this city eight bars of gold and silver bullion, weighing about 950 pounds. This large quantity of precious metal

is the result of last month's (August) run on the Glover mine, near Marysville. The bullion is valued at \$6 an ounce, making the whole amount to nearly \$70,000.

NEW MEXICO.

NOTES.—*Socorro Bulletin*, Sept. 12: John Baly and F. Ryan are sacking mineral from their argiferous copper property. General Strickler will ship it for them, and he expresses the opinion that it will net them after all expenses are paid, not less than \$25 per ton. The Brittenstein Mining and Milling Company's 50-ton concentrator is being rapidly placed in a condition to drop its stamps, and the Pajarito and Carnero mines are exploited with full day and night shifts. Woodyard, Gochenauer and C. T. Brown are putting capital without hesitation into the Magdalena Queen. The property is showing up finely, and a rich dump of mineral attests its value. Negotiations are pending for the sale of the Magdalena Queen group of mines, embracing several of the most valuable claims on the summit of the Magdalena. McMillen and Row have, at 200 feet, a formidable body of ore in the Iron mountain district which will average not less than \$13 per ton in gold and silver. Thirty-five men are working in the Juanita, and that mine ships 23 tons of ore per day. It is undergoing extensive exploitation and development. The Merritt Mining and Milling Company of this city shipped two silver bricks last Monday, and will send two more to market to-night. It is rumored that the Graphic Mining and Smelting Company will add two 60-ton furnaces to their present capacity. A force of miners are working in the Graphic mines, and the construction of good roads to it is being effected. The Kelly is exploited with full shifts, and ships about 500 tons of ore to the Billing works weekly. Pat Leedy and M. McLeish continue to sink on their Bonaparte, and are raising pay mineral. As we go to press authentic information reaches us of a rich strike in the Magdalena Queen.

OREGON.

PINE CREEK NOTES.—*Cor. Bedrock Democrat*, Sept. 7: Last Tuesday, Jack Mahan and partners, struck an extension of the Union ledge and the rock shows up equal to that taken from the original discovery. The ledge crosses a gulch and runs somewhat south of the first location. About two tons of ore from the Emmet mine has been crushed in Howard's amarra, but I am not informed as to whether a clean-up has been made. The ore shows free gold, but my opinion is that free milling ore is scarce here, and that a more scientific process than that of amarra working will have to be brought into use before any great amount of wealth will find its way to a returnable market. I do not make this assertion as an "expert" but believe it expresses the opinion of those competent to judge after careful study of ore in sight. Work is completed on the contracts of the bonded mines, but it is not publicly known whether or not the mines have been accepted. Money for paying workmen in fulfilling their contracts, has not yet arrived to pay them off, but no doubt is expressed as regards the men being paid for labor well done. Just now they need it and ought to have it. It is the same old story—not a ledge discovered but enlarges and improves upon development, and to-day confidence in the Pine Creek mines is more solidified and openly expressed than at any time since their discovery, but if anything is to be done this season in the way of erecting mills and putting in machinery there is no time to lose.

NOTES.—*Jacksonville Times*, Sept. 5: J. C. Neitz and brother are at Galice creek on a prospecting tour. Parks' mill at Sterling is engaged in sawing 30,000 feet of lumber for Ankeny & Co.'s reservoir. Wm. Bybee had a quartz mill hauled from Josephine county last week and will have it put up in this section. J. Klippel & Co. have finished wing-damming the Applegate, and will soon commence mining the bed thereof. Eli Taylor is in Jacksonville again, having been on a prospecting tour in Josephine county for several weeks past. He thinks he has found a promising gravel mine.

UTAH.

REVIEW.—*Salt Lake Tribune*, September 11: The week has seen the dissipation of the summer weather, and early fall weather is upon us. The season of mining activity is at its height. The negotiations for the purchase of Martin's Horn Silver, at Lava Creek, Idaho, are in suspense as far as known, but as Mr. Paddock has returned and gone north, very probably the sale will be consummated this week, if indeed it has not been already. The shipments of the metals from this city for the week ending Saturday, September 5th, inclusive, were 2,261,078 pounds. The receipts of bullion and ore in this city for the week ending September 5th, inclusive, were \$53,718.65 in bullion and \$21,480 in ore, a total of \$75,198.65. The receipts of the week before were \$70,290.49 of bullion and \$14,992 of ore, an aggregate of \$85,282.49. No shipments of the Ontario have been reported for the week, the total output for the year standing at \$1,033,411.71. Two gold bars from the Kentuck mine were received on the 5th inst., valued at \$15,000. The Stormont sent up during the week two bars of silver, valued at \$3300. The product of the Hanauer smelter for the week has been 10 cars of bullion of the value of \$23,340. The Germania produced during the week four cars of bullion, valued at \$11,888.65.

A party of old prospectors leave here this coming week for the extreme southern portion of this Territory on a new discovery. We hope they will strike it big.

The mines in North Star continue to improve and Mr. Campbell feels more hopeful than ever as to the permanency of the deposits. In the Hickory a fine body of ore has been developed at a greater depth than has heretofore been attained. But it has taken lots of money and perseverance to accomplish it. Mr. Campbell's pay roll is now greater than the Horn Silver.

THE LEACHING WORKS.—The works have been running steadily for 40 days and nights, leaching 27 tons of tailings every 24 hours during the time. The new works will have a set of Cornish rolls attached for crushing ore, and the capacity will be 75 tons per day. The company will depend principally on custom ore, and chlorides will receive terms that will enable them to work ore that before was heaved over the dump as waste.

1850. 1885.
RANKIN, BRAYTON & CO.,
...BUILDERS OF...
MINING MACHINERY.

San Francisco: 127 First Street. Chicago: 160 N. Clinton. New York: 145 Broadway.

PLANTS FOR GOLD AND SILVER MILLS, embracing machinery of LATEST DESIGN and MOST IMPROVED construction. We offer our customers the BEST RESULTS OF 35 YEARS' EXPERIENCE in this SPECIAL LINE of work, and are PREPARED to furnish from SAN FRANCISCO or CHICAGO, the MOST APPROVED character of MINING AND REDUCTION MACHINERY, adapted to all grades of ores and SUPERIOR to that of any other make, at the LOWEST POSSIBLE PRICES.

We are also prepared to CONSTRUCT and DELIVER in COMPLETE RUNNING ORDER, in any locality, MILLS, CONCENTRATION WORKS, WATER JACKET SMELTING FURNACES, HOISTING WORKS, PUMPING MACHINERY, ETC., of any DESIRED CAPACITY.

WATER JACKET SMELTING FURNACES

For COPPER and ARGENTIFEROUS LEAD ores of NEW and ORIGINAL DESIGNS, covered by LETTERS PATENT. No other Furnace CAN COMPARE with these for DURABILITY, and in CAPACITY for uninterrupted work. MORE THAN 150 of them are now RUNNING in various parts of THIS COUNTRY, as well as many in FOREIGN COUNTRIES, giving results NEVER BEFORE ATTAINED as regards CONTINUOUS running, ECONOMY of fuel, AMOUNT and QUALITY of BULLION produced. These CLAIMS have been PROVEN BY RESULTS in ANY NUMBER of INSTANCES, and the GREAT SUPERIORITY of this SYSTEM of smelting ores DEMONSTRATED BEYOND QUESTION. COMPLETE PLANTS furnished to order of any CAPACITY, with ALL IMPROVEMENTS that experience has DEMONSTRATED as VALUABLE in this class of work.

Beyond question the cheapest and most effective machine of the kind now in use adapted to all grades and classes of ores.

This machine has been THOROUGHLY TESTED for the past TWO YEARS, under a GREAT VARIETY of CONDITIONS, giving most EXTRAORDINARY results FAR IN ADVANCE of anything EVER BEFORE REALIZED. A recent COMPETITIVE TEST at the Carlisle Mine in Mexico, showed an ADVANTAGE OF OVER 30 PER CENT in favor of THE DUNCAN. The amount SAVED OVER THE TRUE being sufficient to PAY THE ENTIRE COST of the machines EVERY MONTH OF THE YEAR. One of its MOST VALUABLE features is as an AMALGAMATOR. It saves all THE AMALGAM GOLD and SILVER that ESCAPES the BATTERIES, PANS or SETTLERS, making the machine worth MORE than ITS COST for THIS PURPOSE ALONE.

Baker's Mining Horse Power.

Possessing all the requirements of a first-class hoist, and affording means for the continuous operation of a Pump or Blower, without interfering with a hoisting apparatus. It is made entirely of iron, no piece weighs over 300 pounds. At the ordinary speed of a horse, a 1,000-pound bucket of ore may be raised 120 feet per minute. The hoisting-drum is under the complete control of the man of the shaft, and is capable of carrying 500 feet of five-eighths steel rope. SEND FOR CIRCULAR.

IMPROVED FORM OF HYDRAULIC GIANTS.

The above cut illustrates the IMPROVED FORM OF HYDRAULIC GIANTS, which we manufacture. All similar styles are infringements upon this form, and a judgment stands of record to that effect, under the decision of Judge Sawyer of the U. S. Circuit Court in the matter of Hendy and Fisher vs. R. Hoskin et al.

Prizes furnished upon application to

JOSHUA HENDY MACHINE WORKS,
39 to 51 Fremont St., San Francisco, Cal.

This cut represents our

**IMPROVED
HYDRAULIC
MACHINE.**

IT DIFFERS FROM THE OLD STYLE IN HAVING ONLY ONE JOINT instead of two. It is of greater capacity and more easily worked and kept in repair. The statement of Mr. Hendy that all styles are infringements on the machines made by him, he knows to be utterly false. All litigation has been in reference to old style two jointed machines, which are superseded by our new style one jointed. The decision of Judge Sawyer, referred to by him, is carried up on appeal to U. S. Supreme Court, with absolute certainty of a reversal in our favor. Send for Circulars and Price List.

Scientific Press

Patent Agency.

[ESTABLISHED 1860.]

Inventors on the Pacific Coast will find it greatly to their advantage to consult this old experienced, first-class Agency. We have able and trustworthy Associates and Agents in Washington and the capital cities of the principal nations of the world. In connection with our editorial, scientific and Patent Law Library, and record of original cases in our office, we have other advantages far beyond those which can be offered home inventors by other agencies. The information accumulated through long and careful practice before the Office, and the frequent examination of Patents already granted, for the purpose of determining the patentability of inventions brought before us, enables us often to give advice which will save inventors the expense of applying for Patents upon inventions which are not new. Circulars of advice sent free on receipt of postage. Address DEWEY & CO., Patent Agents, 252 Market St., S. F.

Pasteur and Jenner.

EDITORS PRESS:—I have read the article on the philosophy of vaccination in the SCIENTIFIC PRESS of the 25th ult., and venture to offer a few observations thereon. Professor Tyndall has become the champion of Pasteur and his inoculations for the abolition of splenic fever in sheep, and rabies in dogs, of cholera in fowls and zymotics in the human family, and claims that as Jenner has extinguished small-pox epidemics by means of vaccination, Pasteur will just as effectually put an end to these other maladies by means of his attenuated viruses. Professor Tyndall demands a free vivisection table for England to assist in this brilliant enterprise of imparting a mild infection of everything to everybody. The major premise in this case is assumed, but not proven. Small-pox, so far from being extinguished, as is presumptuously claimed, has appeared in a most virulent form in London, where, during the past few months, 7000 vaccinated and protected patients have been admitted into the small-pox hospitals; so, also, in Birmingham, Liverpool, Sunderland, Durham and other towns where vaccination has for thirty-two years been vigorously enforced upon recusants under penalties of fines, seizure of goods and imprisonment. About a hundred medical nonconformists—men of blameless character—many of whom have had children injured or killed by vaccination, are summoned as criminals before the various tribunals every week, and thousands of intelligent parents and good citizens, who regard vaccination with contempt due to a mischievous and dangerous delusion, are being driven into active rebellion against these cruel laws.

In several large towns, as Leicester, Bingley, Keighley, Baubury and Dewsbury, the machinery of coercion has completely broken down, and the vaccination laws, in this words of the *Times*, are "practically a dead letter." The Guardians at Bradford have recently instructed their vaccination officer not to prosecute further, as such coercion has entirely failed in its effect. The people prefer to spend the local taxes in promoting public health by the more rational and effective method of municipal and personal hygiene, and as a result, small-pox has no abiding-place in these populous unvaccinated communities. In Leicester, a city of 130,000 inhabitants, where the vaccinations (in spite of unrelenting coercion) are considerably less than one-third the registered births, cases of small-pox are of the rarest occurrence, and when these occur, investigation has shown they are imported from London or other well-vaccinated cities. In Keighley, Yorkshire, a town of 35,000 inhabitants, vaccination has been repudiated for years, the repudiation being due to sad experiences of its mischievous effects, and the official reports show that out of each hundred births, only 12 are vaccinated. It has been observed that infantile mortality has diminished concurrently with the abandonment of vaccination, as in those cantons of the Swiss confederation, which have abrogated the compulsory laws. The dangers attending the operation can no longer be concealed, and are proved by the steady augmentation of all inoculable affections in England, such as skin disease, scrofula, blood-poisoning, phlegmon, and vaccino-syphilis; the last loathsome malady, according to the Registrar-General's Returns (Nos. 392 and 433), has increased fourfold per million of births since the vaccination laws came into operation in 1853. The recent Medical Vaccination Census (Dr. Makuna's Transactions) shows that out of 334 physicians, medical officers of health, and public vaccinators who gave evidence to the Exeter Hall Committee, 242 testify to having met with diseases communicated by vaccination, and 33 of these certify to fatal cases of vaccination within their own experience. And if these results are so frequent, the inconspicuous injuries from the operation must deteriorate infantile health throughout the kingdom, and weaken the capacity to meet the ordinary maladies incident to early life.

How much longer is this miserable survival of class legislation, this mischievous bolstering-up of a ridiculous medical error to be submitted to?

At the recent International Anti-Vaccination Congress, held at the Hotel de Ville, Charleroi, Belgium, at which all the leading European States, as well as the United States, were represented, statistical evidence was adduced from official reports, showing that while vaccination had had no effect in arresting or diminishing various outbreaks, it was itself the cause of a serious augmentation of certain diseases.

Many cases of injury to emigrants, arising from their vaccination before being permitted to land in the United States, were brought before the Congress, and a resolution calling upon the Government to repeal the law was passed unanimously.

WILLIAM TEEB.

7 Albert Road, Regents Park, London, Eng., Aug. 27th.

THE Clayton Steam Pump and Air Compressor Works have removed their office and salesrooms from 14 and 16 Water Street, Brooklyn, to 43 Day Street, New York. This old established manufactory is well and favorably known from the character of its products, and its patrons on this coast will be glad to hear of its steady progress.

SAVED! my eyes by using Muller's pebbles. 135 Montgomery street, near Bush, opposite Occidental Hotel.

EXPLANATION.—Cl. for clear; Cy. cloudy; Fr. fair; Fy. foggy; — indicates too small to measure. Temperature wind and weather at 12:00 M. (Pacific Standard time), with amount of rainfall in the preceding 24 hours.

Mining Share Market.

There is very little interest in the stock market just now. The dealers are watching the progress of opening up the 3100 level of the Hale & Norcross with interest. The *Enterprise* says that the fact is that the opening of the 3100 level from the deep winze has just commenced, and has not progressed far enough to ascertain or define anything. The face of the drift is only 35 feet from the winze, and being swung around due south is not crosscutting the ledge at all. Moreover, it must be considered that this one small opening in the great lode is a worm-hole in a pumpkin as compared with the great space of ground it has to explore. Its face was reported at headquarters to be all in ore last evening, and, although not assaying very high, the indications for running directly into a heavy vein of good pay ore were excellent, almost amounting to a certainty.

The main drift west from the 3100 level of the Combination shaft, which will eventually connect with the drift from the Hale & Norcross deep winze, has nearly reached the main ore vein. Low grade ore extraction goes steadily ahead in Yellow Jacket, and it is again rumored that ore extraction is shortly to be resumed in Crown Point and Belcher.

Bullion Shipments.

Argus, Sept. 10th, \$9931; Mentor, 10th, \$16,567; Albambra mill, 13th, \$15,000; Barber's mill, 13th, \$8000; King 13th, \$8674; Calico mill, 13th, \$5610; Willow Creek, 5th, \$3000; Germania, 8th, \$4932; Hanauer, 8th, \$9100; Stormont, 8th, \$3500; Crescent, 8th, \$3390; Queen of the Hills, 8th, \$1400; Leon, 8th, \$410; Crescent, 10th, \$2600; Germania, 10th, \$2319; Hanauer, 11th, \$2200; Germania, 11th, \$2466; Queen of the Hills, 11th, \$1300; Hanauer, 12th, \$2200.

The banks in Salt Lake City report the receipts for the week ending Sept. 9th, inclusive, of \$53,718.65 in bullion and \$21,480 in ore, a total of \$75,198.65.

New Incorporations.

The following companies have been incorporated and papers filed in the office of the Superior Court, department 10, San Francisco.

IRON MOUNTAIN MINING CO. Sept. 15. Location, Shasta Co. Capital stock, \$9,000,000, in 90,000 shares. Directors: Thos. H. Hobson, George N. Wilcox, Edward P. Figg, Wm. O. Smith, N. W. Tallant, L. A. Garnett and John O. Earl.

GRAY EAGLE MINING CO. Sept. 15. Capital stock, \$1,000,000. Directors: S. Keeling, H. W. Gray, T. G. Durning, H. M. Rosecrans, L. P. Waller and E. W. Griswold.

In Ophir and Park Canyons, some 50 miles northwest of Belmont, there are practical evidences of a better future, but these are about the only sections in Nye county, Nev., in which there is any decided activity.

Market Reports.

Lumber at Wholesale.

The Redwood Lumber Association has established no prices since the first of the year.

Redwood—Cargo prices are at present as follows: Rough, merchantable, 3/4 M ft., \$14.00; Rough, clear and surfaced, \$24.00; 1x10 Rustic, No. 1, \$28.00; 1x10 Rustic, No. 2, \$20.00; 1x8 V Rustic, No. 1, \$23.00; 1x8, tongued and grooved, \$23.00; 1x4, tongued and grooved, beaded, \$23.00; 2 in. x 3, Battens (board measure), \$30.00; Shingles, 7/8 in., \$2.00.

Pine—Rough, \$15.00; No. 2, \$12.00; do do in lengths, \$13.00; rough, 40 to 50 ft. lengths, \$10.00; do do to 60 ft., \$17.00; T and G Flooring, 1x8, \$28.00; do do 1x6, \$25.00; do do 1x4, \$28.00; do do No. 2, \$21.00; Vertical Grain M and G Flooring, 1x6, \$30.00; do do do 1x4, \$32.00; Stepping, \$37.50; Furring, 1x2, per lineal ft., 3 c.

Lumber at Retail.

Prices fixed by the association April 1st. are as follows:

Pine, Rough	\$15.00
" " No. 2	12.00
" " 2 in lengths	13.00
" " 40 to 50 feet lengths	10.00
" " 60 " 60 "	17.00
T. & G. Flooring 1 x 8	28.00
" " 1 x 6	28.00
" " 1 x 4	28.00
" " No. 2	21.00
Vertical Grain T. & G. Flooring, 1 x 6	30.00
" " 1x6, 1x4	32.00
Stepping	37.50
Furring, 1 x 2, per lineal foot	3 c.
Redwood, Rough	17.00
" " No. 2	13.00
" Surfaced	30.00
" " 1 x 8	28.00
" " 1 x 6	28.00
" T & G. 6 in. 12 ft. and over	28.00
" " 7 to 12 ft.	25.00
" " under 7 ft.	30.00
" Rustic	30.00
" " No. 2	25.00
" T & G. Beaded 12 ft. and over	30.00
" " 7 to 11 ft.	25.00
" " under 7 ft.	20.00

List of U. S. Patents for Pacific Coast Inventors.

[From the official list of U. S. Patents in Dewey & Co.'s Scientific Press Patent Agency, 252 Market St., S. F.]

FOR WEEK ENDING SEPTEMBER 8, 1885.

- 325,643.—STATION INDICATOR—M. Anthony, S. F.
 325,810.—MINERAL SEPARATOR, F.L.—A. G. Herbe, Los Angeles, Cal.
 325,782.—FRUIT DRIER.—Blatchley & Hatch, S. F.
 326,012.—HOSE PATCH.—S. T. Brooks, S. F.
 325,055.—PORTABLE SPOOL HOLDER—Edward Carlson, S. F.
 325,788.—MILL STOCK FEEDER—Geo. Cottrell, S. F.
 325,799.—SCREW PLATE.—B. Elmore, Shasta, Cal.
 325,792.—DISH WASHER—Sally M. Fenton, Salinas, Cal.
 325,840.—BAG BEATER, E.D.—E. W. Hough, Oakland, Cal.
 325,804.—CRUSHING MILL.—F. A. Huntington, S. F.
 326,042.—INKING PAD FOR HAND STAMPS—C. A. Klinkner, Oakland, Cal.
 324,840.—BALING PRESS—L. B. Lathrop, Hollister, Cal.
 325,681.—WATER FILTER—O. S. Linden, S. F.
 325,083.—LID FOR GAS STOVES—Sarah B. Long, S. F.
 325,054.—FRUIT AND VEGETABLE PRESERVING APPARATUS—L. H. Moore, S. F.
 325,866.—GLASS CASE FOR CLOCKS, ETC.—J. G. Schullweis, S. F.
 326,072.—DISCHARGE PIPE FOR DREDGERS—A. W. Von Schmidt, S. F.
 325,777.—FRUIT DRIER—B. A. Wright, Pasadena, Cal.

NOTE.—Copies of U. S. and Foreign Patents furnished by Dewey & Co. in the shortest time possible (by telegraph or otherwise,) at the lowest rates. American and Foreign patents obtained, and all patent business for Pacific Coast inventors transacted with perfect security and in the shortest possible time.

Notices of Recent Patents.

Among the patents recently obtained through Dewey & Co.'s Scientific Press U. S. and Foreign Patent Agency, the following are worthy of special mention:

BALING PRESS.—Levi B. Lathrop, Hollister. No. 325,843. Dated Sept. 8, 1885. This patent covers improvements on former inventions by the same patentee. A number of details of construction are described which greatly improve the original design.

MILL STOCK FEEDER.—Geo. Cottrell, S. F. No. 325,788. Dated Sept. 8, 1885. The invention relates to that class of feeders used for delivering mill stock to rolls, purifying machines, etc., and the invention consists in the construction and in a combination of devices for making an effective machine.

DISH WASHER.—Sally M. Fenton, Salinas, Monterey Co. No. 325,792. Dated Sept. 8, 1885. The object of this invention is to provide a means for firmly holding the dishcloth and for wringing it effectively and conveniently. The cloth itself does not have to be handled, but is held in loops, which are capable of separation so that the cloth may be wrung.

SCREW PLATE.—Benton Elmore, Shasta. No. 325,799. Dated Sept. 8, 1885. This is a screw-cutting plate of novel construction. It consists of two parallel jaws or plates, having the adjacent faces grooved and formed so as to cut threads upon any bolt or piece of metal which may be inserted between them; the opposite end of each plate having transverse extensions, so that the plates may be opened or closed by the movement of the levers. Strong springs are so attached as to press upon the backs of the plates and force them together, and adjusting screws determine the spaces which shall be left between them while at work.

FIRE ESCAPE.—There is on exhibition at the Mechanics' Fair an ingenious system of fire escape intended to be attached to high buildings, which is the invention of O. Hanson, of Walnut Grove. A large working model has been made which attracts much attention. It represents the invention as attached to the highest building in New York. This invention consists of an elevator and ladder which may be attached to any building, at slight expense, for use at any time in case of fire. The occupants of any of the rooms, even the highest, may be removed in safety by means of this appliance.

Our Agents.

OUR FRIENDS can do much in aid of our paper and the cause of practical knowledge and science, by assisting Agents in their labors of canvassing, by lending their influence and encouraging favors. We intend to send none but worthy men.

- JARED C. HOAG—California.
 J. J. BARTELL—Sacramento and San Joaquin.
 A. C. KNOX—Nevada (State).
 G. W. INGLE—Arizona.
 E. L. RICHARDS—Los Angeles and San Bernardino.
 W. B. TURNER—Idaho and Montana.
 GEO. McDOWELL—Tulare, Kern and San Luis Obispo.
 HUGH ELIAS—Nevada Co.
 J. DE PUE, Colusa and Butte Co's.
 B. E. LEVY, Contra Costa and Stanislaus.

Don't Fail to Write.

Should this paper be received by any subscriber who does not want it, or beyond the time he intends to pay for it, let him not fail to write us direct to stop it. A postal card (costing one cent only) will suffice. We will not knowingly send the paper to anyone who does not wish it, but if it is continued, through the failure of the subscriber to notify us to discontinue it, or some irresponsible party requested to stop it, we shall positively demand payment for the time it is sent. LOOK CAREFULLY AT THE LABEL ON YOUR PAPER.

The Pacific Rolling Mills.

The exhibit in the Mechanics' Fair, which most fully illustrates our mechanical advancement on this coast, is that of the Pacific Rolling Mills. All of the articles are of utility in railroad and building construction and similar work. There is nothing for mere ornament.

The main feature is of course the steel, which is a comparatively new product on this coast, but which, now that it can be obtained here in desired shapes, is coming into use in many forms in displacing iron. The Rolling Mills are now making a large number of various articles from this product. The steel made here is as good as any manufactured anywhere. They have spared no expense in procuring a first-class plant and skilled workmen, and are prepared to compete with other manufacturers in cast or rolled steel. Steel railroad rails are exhibited which have been twisted cold, so as to show the strength. Then there are steel axles for railroad trucks, locomotives, etc.; samples of all kinds of rails for steam and street railroads; large steel frogs; spikes of various kinds and sizes; railroad targets for changing switches; links and pins bent and doubled up cold, to show strength, etc.

There is also on exhibition a large double crank shaft made for the U. S. steamer *Adams* at Mare Island. It is specially noticeable for its beauty of finish. The shaft is made of the finest quality of wrought iron.

There are turn-buckles of different sizes, one of them weighing 1180 pounds. This is six inches in diameter, and was cut with tap and die, the taps and dies having been made at the mills.

Bolts from 3/16 up to any size required are made at these mills. Nuts of various kinds and qualities are exhibited, both punched and forged. There are eye-beams for girders of different dimensions, lag bolts, washers, large and small, quoits, wagon tires, angle iron, etc. There is one steel screw 2 1/2 inches in diameter and 20 feet long which was made with a die, and the thread is more perfect than if made on a lathe. This is for the new dry dock of the Union Iron Works. There are many rude forms made from rolled steel which are jumbled up, tied in knots, and all sorts of fantastic shapes. This is specially interesting as showing the strength and toughness of the material and its freedom from brittleness. There are several examples of heavy steel castings, in the shape of minions, etc.

The whole display is very tastefully made up, and is brilliantly lighted by the Pacific Coast Electrical Construction Co. (Keith's dynamo machines). The large sign of "Pacific Rolling Mills" is formed of washers. There is also a large star formed of lag bolts; a representation of a pair of calipers made of different sized washers; a pair of dividers formed of hot punched rivets, and a heart of the same things. Inside of this are samples of the different little steel forgings made at the mills. The credit of the fanciful arrangement is due to W. C. Wilcox, who has charge of the display. He has made it attractive and artistic, and especially so when the character of the materials is considered. The whole exhibit is very creditable to the mills and to San Francisco.

A Handsome Premium.

The publishers of this paper have had printed on fine paper and handsomely bound, a neat little volume, entitled "A Beautiful Poetic Review and Friendly Offering." It was written by Dr. J. R. Bradway, orator of Oakland Council, American Legion of Honor, and read in short sections by the author at different meetings, eliciting much praise from his listeners. The work is embellished with fine lithographic portraits of several noted poets whose writings are mentioned in the work. We believe the book will prove a pleasant and attractive keepsake in every family—it can be so readily taken up and read at leisure moments may occur. It will be mailed for 25 cents to subscribers (old or new), upon paying 12 months in advance for this paper. Or to those who pay one year and three months in advance we will send this beautiful souvenir free, postpaid.

Lost Papers.

If any subscriber fails to receive this paper promptly after making due inquiries at the Postoffice, he is urgently requested to notify this office by letter, that we may send the missing papers, and, if possible, guard against further irregularities.

Inducements to Subscribers.

To favor subscribers to this paper, and to induce new patrons to try our publication, we offer the following advantages to all new subscribers who pay one year in advance, or present subscribers who will pay their subscriptions up to a date fully one year in advance of the present time. We will furnish the following articles (while this notice continues), at the reduced rates named, viz:

- | | |
|--|-----------------------------|
| 1. World's Encyclopedia, 791 pages, with 1,200 illustrations, worth \$1.75. | Postpaid for 50 cts. |
| 2. Patent Binder (cloth cover) with metal of this paper in gilt. | Postpaid for 50 cts. \$1.00 |
| 3. To New Subscribers, 12 select back Nos. of the MINING AND SCIENTIFIC PRESS. | Free .75 |
| 4. Any of Harper's first class periodicals, 15 per cent less than regular rates. | |
| 5. Frank Leslie's and most other U. S. periodicals, 15 per cent discount from regular rates. | |
| 6. Pacific Coast and Eastern Dailies, Books and Periodicals, except special publications, we can usually give 10 to 15 per cent less than advertised retail rates. | |
| 7. Picturesque Arizona, 380 pages, in cloth and gilt. | Postpaid for 25 cts. 1.25 |
| 8. Californian, 100 pages, Magazine, 1880 to 1882 (5 Vols.) single Nos. | Postpaid for 3 cts. .35 |
| For volume, unbound, 5 Vols., Postpaid for 20 cts. | 2.00 |
| For volume, bound, cloth back and stiff paper sides. | Postpaid for 40 cts. 2.50 |
| 9. Picturesque California Homes (40 building plans and estimates). | Postpaid for \$1 3.50 |
| 10. Dewey's Patent Newspaper File Holder (18 to 30 inch). | Postpaid for 25 cts. .50 |

NOTE.—The cash must accompany all orders. If too much is sent for any article or publication, the balance will be returned immediately. Address this office, No. 252 Market St., S. F.

P. S.—No. 11 is really a valuable premium to newcomers and others who appreciate the better class of stories and a good standard of California literature.

- | | |
|---|---------------------------|
| Webster's Dictionary, 631 pages, with 1,500 illustrations. | Postpaid for 50 cts. 1.50 |
| Grant Lithograph, size 24x19. | Postpaid for 50 cts. .50 |
| Cleveland Fine Steel Plate, size 12x18. | Postpaid for 10 cts. .50 |
| Grant Steel Plate, cabinet size. | Postpaid for 5 cts. .25 |
| De Groot's History of Mining in California. | Postpaid for 5 cts. .25 |
| Beautiful Poetic Review, a handsome, entertaining and instructive souvenir of real merit. | Postpaid for 25 cts. .50 |

Send for any further information desired. Readers will please inform their new neighbors and others concerning our paper and these offerings. On application, sample copies of this paper will be mailed free to the address of any persons thought likely to subscribe.

DRY WASHER for PLACERS

THE HITCHCOCK & HERSHEY
NEW DRY GOLD CONCENTRATOR.

This Machine weighs only 325 pounds; readily taken apart; packs in small compass; may be run by hand or horse power. Capacity, two tons an hour. No blowers or 6x1 fans or quicksilver used. Frano all rollable iron. Will save a higher percentage of gold than other machines. TATUM & BOWEN, San Francisco and Portland, Agents.

Now on exhibition at Mechanics' Fair, San Francisco, where it may be seen in operation.

Dewey & Co., American and Foreign Patent Agents.

PATENTS obtained promptly; Caveats filed expeditiously; Patent Reissues taken out; Assignments made and recorded in legal form; Copies of Patents and Assignments procured; Examinations of Patents made here and at Washington; Examinations made of Assignments recorded in Washington; Examinations ordered and reported by Telegraph; Rejected cases taken up and Patents obtained; Interferences Prosecuted; Opinions rendered regarding the validity of Patents and Assignments; Every legitimate branch of Patent Soliciting promptly and thoroughly conducted.

Our intimate knowledge of the various inventions of this coast, and long practice in patent business, enable us to abundantly satisfy our patrons; and our success and business are constantly increasing.

The shrewdest and most experienced Inventors are found among our most steadfast friends and patrons, who fully appreciate our advantages in bringing valuable inventions to the notice of the public through the columns of our widely circulated, first-class journals—thereby facilitating their introduction, sale and popularity.

Foreign Patents.

In addition to American Patents, we secure with the assistance of co-operative agents, claims in all foreign countries which grant Patents, including Great Britain, France, Belgium, Prussia, Austria, Baden, Peru, Russia, Spain, British India, Saxony, British Columbia, Canada, Norway, Sweden, Mexico, Victoria, Brazil, Bavaria, Holland, Denmark, Italy, Portugal, Cuba, Roman States, Wurtemberg, New Zealand, New South Wales, Queensland, Tasmania, Brazil, New Granada, Chile, Argentine Republic, AND EVERY COUNTRY IN THE WORLD where Patents are obtainable.

No models are required in European countries, but the drawings and specifications should be prepared with thoroughness, by able persons who are familiar with the requirements and changes of foreign patent laws—agents who are reliable and thoroughly established.

Our schedule price for obtaining foreign patents, in all cases, will always be as low, and in some instances lower, than those of any other responsible agency.

We can and do get foreign patents for inventors in the Pacific States from two to six months (according to the location of the country) SOONER than other agents.

The principal portion of the patent business of this coast has been done, and is still being done, through our agency. We are familiar with, and have full records, of all former cases, and can more correctly judge of the value and patentability of most inventions discovered here than any other agents.

Situated so remote from the seat of Government, delays are even more dangerous to the inventors of the Pacific Coast than to applicants in the Eastern States. Valuable patents may be lost by extra time consumed in transmitting specifications from Eastern agencies back to this coast for the signature of the inventor.

Confidential.

We take great pains to preserve secrecy in all confidential matters, and applicants for patents can rest assured that their communications and business transactions will be held strictly confidential by us. Circulars of information to inventors, free.

Home Counsel.

Our long experience in obtaining patents for Inventors on this Coast has familiarized us with the character of most of the inventions already patented; hence we are frequently able to save our patrons the cost of a fruitless application by pointing to them the same thing already covered by a patent. We are always free to advise applicants of any knowledge we have of previous applicants which will interfere with their obtaining a patent.

We invite the acquaintance of all parties connected with inventions and patent right business, believing that the mutual conference of legitimate business and professional men is mutual gain. Parties in doubt in regard to their rights as assignees of patents or purchasers of patented articles, can often receive advice of importance to them from a short call at our office.

Remittances of money, made by individual inventors to the Government, sometimes miscarry, and it has repeatedly happened that applicants have not only lost their money, but their inventions also, from this cause and consequent delay. We hold ourselves responsible for all fees entrusted to our agency.

Engravings.

We have superior artists in our employ, and all facilities for producing fine and satisfactory illustrations of inventions and machinery, for newspaper, book, circular and other printed illustrations, and are always ready to assist patrons in bringing their valuable discoveries into practical and profitable use.

HOOD'S FOUNDRY COKE.

Consumers are respectfully informed that owing to inferior brands of Coke having been sold in this and other countries under the name of "Patent Coke," the Glamorgan Coal Co. (Limited), Cardiff, in May, 1884, abandoned the title of "Patent Foundry Coke," substituting that of "Hood's Foundry Coke."

This Coke is exclusively used by the Selby Smelting and Lead Co., Union Iron Works, Professor Thomas Price, and other consumers here. Large quantities are regularly forwarded to Copper Smelters in Arizona and New Mexico, and also to consumers in Nevada and Salt Lake.

The undersigned are the SOLE IMPORTERS of the above Coke, which is for sale in quantities to suit purchasers.

THE ROLLERORE FEEDER

[Patented May 28, 1882.]

This is the best and cheapest Ore Feeder now in use. It has fewer parts, requires less power, is simpler in adjustment than any other. Feeds coarse ore or soft clay alike uniformly, under one or all the stamps in a battery as required. In the Bunker Hill Mill it has run continuously for two years, never having been out of order or costing a dollar or repairs.

\$1,000 CHALLENGE!

**THE FRUE ORE CONCENTRATOR,
OR VANNING MACHINE.**

**PRICE: FIVE HUNDRED AND SEVENTY-FIVE DOLLARS,
(\$575 00), F. O. B.**

OVER 1,000 ARE NOW IN USE. Saves from 40 to 100 per cent more than any other Concentrator Concentrations are clean from the first working. The wear and tear are merely nominal. A machine can be seen in working order and ready to make tests at the Fulton Iron Works, No. 220 Fremont Street, San Francisco. As the result of a suit East against an End-Shake Machine (the Embrey), similar to the Triumph, the Frue Vanning Machine Company owns the Embrey patent, and can put in the market an End-Shake Machine of earlier patent that will do as good work as the Triumph, and superior in construction and durability. There will be no risk of suit for infringement. The Frue Vanning Machine Company warn the public that they claim and will prove the Triumph machine to be an infringement on patents owned by them. Protected by patents May 4, 1880, Dec. 22, 1874, Sept. 2, 1870, April 27, 1880, March 22, 1881, Feb. 20, 1883, Sept. 18, 1883. Patents applied for. N. B.—We are and have been ready at any time to make a competitive trial against the Triumph, or any other Concentrator for stakes of \$1,000.

JENKINS PATENT VALVES.

Gate, Globe, Angle, Check and Safety.

Manufactured of BEST STEAM METAL. We claim the following advantages over other Valves and Gauge Cocks now in use:

1. A perfectly tight Valve under any and all pressures of steam, oils or gases.
2. Sand or grit of any kind will not injure the seat.
3. You do not have to take them off to repair them.
4. They can be repaired by any mechanic in a few minutes.
5. The elasticity of the Disc allows it to adapt itself to an imperfect surface.

In Valves having ground or metal seats, should sand or grit get upon the seat it is impossible to make them tight except by regrinding, which is expensive if done by hand, and if done by machine soon wears out the valve, and in most cases they have to be disconnected from the pipes, often costing more than a new valve. The JENKINS Disc used in these Valves is manufactured under our 1880 Patent, and will stand 200 lbs. steam. Sample orders solicited. To avoid imposition, see that Valves are stamped "Jenkins Bros." For sale by

MINING AND SCIENTIFIC PRESS.

An Illustrated Journal of Mining, Popular Science and General News.

BY DEWEY & CO.,
Publishers.

SAN FRANCISCO, SATURDAY, SEPTEMBER 26, 1885.

VOLUME LI
Number 13.

Sediment Collector and Water Purifier.

The engravings on this page show Spaulding's patent sediment collector and water purifier for boilers. As a result of two days' experiment with this device recently, it was found that they evaporated 1008 gallons of water with 1250 pounds of screenage that cost \$6 per ton. With another kind of coal screenings costing \$3.50 per ton, they evaporated 1050 gallons of water with 1725 pounds. These are very remarkable results.

The engravings show the details of the apparatus. *A* is the front boiler. *B*, side wall of furnace and shell of boiler broken away to show boiler and tubing. *C*, smoke from furnace passing under boiler and through tubes, *D*, up through flue to chimney in the rear. *E*, hot water supply pipe passing into boiler under the flues in boiler, and returning far enough or water to obtain sufficient heat to separate all lime and sediment from the water while in the pipe before being emptied into sediment collector, *F*, then flowing up into the boiler in a pure state, thus preventing the boiler from being encrusted. Under these conditions the boiler is opened only once in six months for cleaning. In a boiler set this way steam rises from 30 to 50 pounds during the night, the machinery being ready to run in five minutes after arrival of engineer.

G is the steam pipe for blowing out the hot water feed pipe, *H*, which is made of two inch pipe cut in pieces about four feet long, so they can be taken out and cleaned by being slightly heated, which it is necessary to do about every two years, if the water is very dirty.

I shows the system of pipes connecting the boiler and sediment collector, *F*, put together by means of flange couplings below the grate bars. By means of these pipes it is claimed that they gain one-third more fire space, or in other words, make about one-third more steam with a given amount of coal than by the old way of setting up a boiler. *J*, blade inside of sediment collector for stirring up sediment so it will blow out of collector into sewer when valve is opened. *K*, grate bars, set thirty inches below boiler. *L*, blow off pipe from sediment collector. *M*, steam pipe to engine. *N*, space four inches between boiler and brick-work on each side, and ten inches over top of boiler formed by an arch over boiler leaving a chamber for heat from furnace, it being closed at each end of boiler down to water line to prevent any draught or blaze over steam space of boiler, thus equalizing the heat on all parts of the boiler. *O*, back pressure check-valve to prevent water from flowing out of boiler when steam is blown through hot-water feed pipe for cleaning it.

Mr. J. Spaulding, 335 Tehama St., in this city, is the inventor of this plan. He refers to Wm. McAfee & Son, boiler makers, 210 Spear St., who have knowledge of the results accomplished by it.

GREAT activity is reported along Snake river, and especially along the bar between the upper and lower Salmon falls. On this bar about 100 men are at work, most of them for a New York company. A ditch two miles long, carrying 3000 miner's inches of water, has been built by a New York company.

Russell Process in Calaveras County.

West Point, Calaveras county, is a district that has been neglected, but a correspondent writes us that it will at no distant day come to

The roasting is being done in a chamber shaped like an assayer's muffle, open at both ends. The ores, when roasted, are worked by amalgamation in a pan, and are said then to realize 97 per cent of fire assay. For the successful

SPAULDING'S PATENT SEDIMENT COLLECTOR AND WATER PURIFIER.

the front once more as a bullion producer. The ores are base and require special treatment. At and near the surface the gold was free, from the decomposition of the sulphurets, but on reaching the water level the mines were generally abandoned. Strange as it may seem, there never have been chlorination works there. Mr. Russell, of the Russell Reduction & Mining Company, has erected works for his process at West Point. The plant is of about 15 tons' capacity, and excellent work has been done up to the time the water failed, this being an unusually dry season.

reduction of these base ores the Russell process is expected to solve the problem. The ores when roasted can be worked by either the pan or by chlorination, as the mine owner chooses; but the pan does all that can be expected or required. When there are tellurides, the furnace gold product, owing to the peculiar construction of the furnace, in not volatilizing the gold that is held in combination with tellurium, will, it is claimed, be in excess of the fire assay. One mine which our informant examined contains a very large percentage of very base sulphurets, and the gold could not amalgamate

in the ordinary way. Mr. Russell built a small furnace at the mine for roasting the ores, and the result was that the gold was easily amalgamated without further manipulation.

New Ore Mill.

Wm. C. Stiles, of this city, has just patented through the MINING AND SCIENTIFIC PRESS Patent Agency, a crushing and grinding mill for ores, etc., in which there are conical corrugated disks mounted on parallel shafts, two cones being placed back to back upon one shaft and revolving between two other conical disks mounted on the other shaft, so as to revolve close to the faces of the double cone.

The frame has boxes on the side for the shaft upon which are fixed disks having conical faces, the apexes of which converge towards the shaft. Upon these conical-faced disks are fixed sections, the inner faces of which are ridged or corrugated to form grinding surfaces.

The other shaft has also disks with corrugated sections similar to those described; but on these the apexes of the conical faces diverge from each other as they extend toward their shaft and their bases are close together. The disks are sufficiently separated to allow the double cone upon the other shaft to fit between them. The angles of the conical faces being the same it will be manifest that those upon the latter described disks will fit between those upon the other disks, the contiguous faces running parallel with each other.

In order to prevent the ridges on the grinding surfaces from coming into contact with each other, if the cones should be adjusted so as to touch, narrow flanges are formed around the exterior and interior edges of the grinding sections, and a little higher than the corrugations, so that these flanges will touch and prevent the corrugations from rubbing against each other.

The grinding sections are preferably formed of steel, and are so secured by bolts that they are removable and changeable. The boxes in which one of the shafts turns have lugs which pass down through slots in the frame and through holes in rods or bars beneath to which they are secured. These bars or rods extend horizontally beneath the frame and through holes in its end, by which they are guided and held in place. Strong springs act upon the ends of the bars which project beyond the ends of the frame, and thus draw them with the boxes and the double-cone toward the cones between which it travels. If any hard, unyielding substance should pass between the cones the springs would allow them to separate until it passed.

Material is fed into a hopper and discharged from it between the contiguous surfaces of the cones and is discharged, as ground, below. A pulley communicates motion to one shaft and its cones, while the other cone, is driven by the friction created by the passing material, or by direct gearing, if desired.

THE Pennsylvania mine, Jackson Creek mountains, Nev., will soon have a 10-stamp mill, which is being moved from South Mountain to Big Creek, near the mine.

THE hydraulic miners at Osceola, Nev., only average about two hours' work a day, on account of scarcity of water.

Discovery of Californian Gold.

Address Delivered Before the Society of California Pioneers, Sept. 9, 1885, by John S. Hittell.

Mr. President and Fellow Pioneers:—At this celebration by our Society of the 35th anniversary of the admission of California as a State into the Union, in accordance with the invitation given to me by the committee of arrangements, I am to address you in reference to the discovery of the gold deposits of the Sierra Nevada. The subject is appropriate for the occasion, because of the recent death of Marshall, and of the comments made upon it by many newspapers on both sides of the continent. I shall give a narrative of the main facts of the discovery, consider to whom it is due, and his measure of credit, and say something about the manner in which he has been treated by the Government and people.

The end of a notable man's life—and Marshall was so notable that his name is an imperishable part of the history of California—makes an epoch in local events. It revives and strengthens public curiosity about him, and calls for a review of his achievements. People then take an interest in biographical details which, at other times, would seem trivial. Then it first becomes possible to close the account of his credits and discredits, and state the final results with the certainty that they will not be changed by any subsequent action on his part.

A native of New Jersey, born in 1812, James Wilson Marshall had a mind, active but not very well balanced, a moderate education, a healthy, strong and well proportioned body, much energy and industry, and the handicrafts of carpenter and wheelwright. When a young man he moved to Missouri, where he spent several years before starting in 1843 for California by way of Oregon. He spent a winter in the valley of the Willamette, and in the spring of 1845, continued his journey by land, until he arrived at New Helvetia, which was then the chief settlement of white men in the Sacramento valley, situated at the point where immigrants coming to California by way of the Humboldt river first reached the navigable waters of the Pacific, and where boats ascending the Sacramento river from the bay found the first house and land above the level of frequent winter floods. At this advantageous position John A. Sutter, a native of Baden but of Swiss parentage, had established himself and erected several adobe buildings, surrounded by an adobe wall. The Americans generally called the place Sutter's Fort. The proprietor had made friends with the surrounding Indians, and all, within many miles, considered themselves his servants, and were ready to work for him in peace and fight for him in war. He had herds of horses and cows; he cultivated much land, mostly in wheat, and he had a store where all the staple articles consumed in the vicinity could be purchased. He was the earliest settler in the Sacramento valley, and for more than ten years was its richest man.

Marshall sought and found employment at New Helvetia as a carpenter, and remained there till the outbreak of the Bear Flag insurrection, when he joined the Americans in arms until they disbanded, to accept the welcome authority of the United States. Then he served in Fremont's battalion until the spring of 1847. Returning to New Helvetia he found that Sutter was anxious to erect a saw-mill. For more than a year the only supply of lumber at the fort had been furnished by the whipsaw of Baptiste, a Frenchman at work in the Sierra Nevada about 50 miles away; but it was unequal to the demand for the completion of a flour-mill, which Sutter had commenced at Brighton on the American river. This was to be finished before the harvest of the next year, when, it was confidently expected, a large immigration would arrive by land, and the number was to increase every year. The newcomers would generally settle in the Sacramento valley and obtain their supplies at New Helvetia. But even if they should not be so numerous as was anticipated there would always be, as there had been, a good market for flour, which Sutter could furnish as cheaply as any rival, since he had the land, the laborers, the oxen and the plows, and he would even have the mill.

To him in June, 1847, Marshall made a proposition to become his partner in the saw-mill enterprise, taking charge of the construction and management. The offer was accepted, and one stipulation of the agreement was that if California should remain under the dominion of Mexico, land at and near the mill should belong to Sutter, who had been naturalized under the Mexican law; but if the territory should finally become part of the United States, then Marshall, as an American citizen, should be the proprietor. The lumber produced, or its price, was to be shared between the partners, no matter in whose name the title should stand. This stipulation was perhaps suggested by Sutter, who feared that his property, as a Mexican citizen, would be confiscated by the conqueror, if the United States should retain the country. The traditions of European warfare, as known to him, did not lead him to anticipate the generous clause of the treaty of Guadalupe Hidalgo, promising full protection to the property rights of the Mexicans in California; and if he had anticipated it, he could scarcely have foreseen how its obligation would have been disregarded.

The enterprise was to be soon commenced,

so, without delay, Marshall started out to find a suitable place, which must be in the mountains, for the wood of the valleys was crooked and brittle. By Sutter's advice he first went to the canyon of the Cosumnes, but an examination of it proved that the water power needed could not be procured there without great expense. He crossed the intervening ridge to the American river, and there at Coloma found the desired combination of timber, power and convenient accessibility by wagon from New Helvetia, which was to be the only market for the lumber. Large yellow pine trees were abundant in the vicinity; a valley a quarter of a mile wide and half a mile long offered a route for a race with sufficient fall, and a site for the mill high enough to be secure from floods, and a distance by wagon route of not more than 50 miles from Helvetia, which was near enough for the purpose. The valley, and the gentle slopes of the surrounding hills contained much tillable soil, which has since come into cultivation, and afterwards Coloma was one of the first places in the Sierra Nevada to become noted for its vineyards and orchards. If instead of a site for a saw-mill, Marshall had been seeking a beautiful mountain home accessible by wagon from New Helvetia, he could not have made a better choice. Among the numerous pleasing productions of the landscape art in our State, one of the most interesting, as well as most truthful to nature, is Charles Nahl's view of Sutter's mill, made from a sketch taken in 1851, by his brother Arthur, and painted in duplicate. Many features of the scene, including the form and color of the hills, the character of the vegetation, and the bright mountain sky, are the same now as they were 36 years ago.

We have no direct evidence that Coloma had ever been seen by any white man before Marshall. It is not on any route of travel used then or since, across the Sierra from the mouth of the American river. Before 1847, other Americans, possessing some skill as lumbermen, had gone from New Helvetia into the mountains searching for a saw-mill site accessible by wagon, and had returned with the report that none could be found. The credit of the discovery and selection belong exclusively to Marshall.

The work began in August. Marshall had taken with him seven white men, including P. L. Wimmer and John Scott, besides ten Indians from the fort. The only white woman in the party was Mrs. Wimmer, who was to cook for the white men. The little colony was isolated. It had no visitors or excitements. All the white men were toilers, and their relations with the Indians of the vicinity were most amicable. Their work advanced steadily, until the 19th of January, 1848. The mill had been erected, the race had been dug, and the water had been turned in. The tail race was, however, not deep enough; the water, instead of running away from the wheel, backed up under it and thus diminished the power. The tail-race could have been deepened by shoveling, but Marshall thought it would be cheaper to let a strong current run through and wash out the sand and gravel, and for this object, the water was turned on at night. No note was taken of the date at the time, but afterwards Marshall thought it was the 19th, and certainly not before the 18th, nor after the 20th of January, when walking along the bank of the tail-race to see what effect the water had had during the night, his attention was fixed and his curiosity excited by some particles of bright yellow color in the race, where the water was perhaps six inches deep. He picked up one. It weighed about the fortieth of an ounce, worth 50 cents, and was of a metallic nature. He wondered whether it was gold; he had read that pyrites is the only mineral resembling gold in a state of nature, and that it can readily be distinguished from the precious metal by its want of malleability. He put his little specimen on a cobblestone, and beating it with another stone saw that it was highly malleable. Of an excitable disposition, and much influenced by first impressions, he was fully convinced that he had found gold, and anxious to communicate the good news to others. He was alone at the time, and he hastened back to the mill and told William Scott, the first man whom he encountered, of his luck, and the others were soon afterward informed. Mrs. Wimmer happened to be boiling soap that day, and she threw the piece into her soap-pot and it was afterward tried with vinegar, but as neither test led to the formation of any verdigris, the general opinion in the camp, at first unfavorable to the gold theory, turned in its favor. Every day Marshall became more sanguine, and every day the men walked along the race to pick up the gold exposed by the washing of the water, and in a few cases loosened a little of the gravel by digging.

On the fifth day after the discovery, having collected several ounces of specimens, Marshall, too much excited to work quietly at a saw-mill, started off on horseback to tell the good news to his partner. Sutter tested the metal with nitric acid, weighed it in and out of water, declared that it was undoubtedly gold, and expressed his readiness to go the next day to the mill. Then for the first time he saw Coloma. He looked at the race, picked up some of the gold, and requested all present to keep the discovery to themselves. He feared that an excitement would disturb the business of the saw-mill, and not only deprive him of the profits which he hoped for it, but also prevent the completion of his flour-mill, to which he attached great importance. He thought

that the lumber for his other mill could be sawn within six weeks, and for that brief period, at least, they ought to keep the secret. All promised, or at least none made any objection to accede to his request, nor was there any good reason why they should not. Sutter had been a kind employer to them and it would have been unfair to leave his enterprise incomplete, for the mill was not yet in running order. Besides, not one of them had any experience in gold washing, or knew the extent of the auriferous deposit, or could clearly foresee a profit for himself in the abandonment of his occupation, with its regular and certain wages. The men then at the mill, and hired by the firm of Sutter and Marshall, were Charles Bennet, Wm. Scott, P. L. Wimmer, James Bargee, Alexander Stephens, James Brown, Ezekiel Parsons, Henry W. Bigler, Israel Smith and Wm. Johnston. These, with Marshall, were the only white male adults, and so far as known all are now dead except Mr. and Mrs. Wimmer, living at San Diego, and Mr. Bigler, at St. George, Utah.

Sutter returned to New Helvetia and the saw-mill work at Coloma went on as before, though every day a search was made in the race for gold. It had no definite market value yet, but as it accumulated, the men began to think of using it in making purchases. About the middle of February one of the mill laborers went to Sutter's Fort and offered it there as money to a trader, who at first thought his customer was crazy, and at last, having consulted Sutter, accepted the new currency. About the end of February, when the six weeks of secrecy solicited by Sutter had nearly expired, Charles Bennet went to San Francisco, which was already the chief commercial center of the territory, for the purpose of learning whether the Coloma metal would be accepted there as gold and if so, what it was worth by the ounce. The watchmakers said it was gold, and they bought it. Of the price paid to Bennet we have no information, but then, or not long afterward, Mr. Russ, after whom the Russ House was named, obtained dust at \$4 an ounce, though it was worth about \$19 in New York.

Before Bennet had disposed of his gold in San Francisco, he met Isaac Humphrey who had been a placer miner in Georgia. Immediately upon seeing the Coloma specimens, he declared that their large size and the circumstances under which they had been collected implied that the diggings must be rich and extensive. He tried in vain to induce some of his friends to go with him to the new gold field, but they had no faith in his opinion, so he and Bennet went alone.

On the 7th of March they arrived at Coloma. The work at the mill was going on as usual. Nobody there was engaged in mining, or knew how to use a pan or rocker. The next day, having tried several places with a pan and got good prospects, Humphrey made a rocker and began to wash the auriferous gravel. The laborers at the mill had heard that he was an experienced gold miner, and they watched him with interest. The implements required were made so easily, the methods of procedure so simple, and the results so large that the mill work was very much disturbed, but was not abandoned, partly because Marshall had the only provisions, wagons, horses, oxen, tools and other necessaries of life; and it was foreseen that if there was much mining, there would be a demand for lumber to make houses and fences. On the question of the richness of the gold deposit and its influence in attracting people, Humphrey spoke emphatically. He said there had been great excitements in Georgia, but that State had no placer that approached Coloma in richness. Four days later another man who had had experience as a gold miner, made his appearance. This was Baptiste, the Frenchman, long a resident in Mexico, who for the last two years preceding his visit to Coloma, had been employed by Sutter to saw out lumber by hand. He agreed with Humphrey that the diggings were wonderfully rich, and he, too, at once began to work with a rocker. The zealous application of these two men to their toil, each working by and for himself, was a strong confirmation of their opinions as expressed to all inquirers, and thus gold mining started in the Sierra Nevada, spreading slowly at first, but after a few weeks filling the whole territory with its excitement.

In the beginning of the year 1848, California had two newspapers, both weeklies, published at San Francisco, the *Californian* and the *California Star*. The former made the first printed mention of the discovery on the 15th of March in a paragraph of a few lines, stating that gold had been found at Sutter's mill, and that a package of it worth \$30 had been taken to New Helvetia. The reporter had evidently not seen Bennet, who arrived at the bay a fortnight before, nor heard of the dust sold there by him. The *Star* of March 18th followed its rival in mentioning the discovery, but gave no additional information, nor was any worthy of note obtained before the middle of April, when the *Star* said that its editor was about to take a trip to the country, and would probably report his observations on his return. Although the newspapers did not say so, orders for tools and provisions for the placers must have arrived at San Francisco, and probably letters from Humphrey and others, urging friends to come and share the wonderful harvest of the precious metal; and the recipients of this advice, hesitating to close their shops and leave their families, thought it would be well to have journalistic confirmation of the reports. Some of the

messages from Coloma must have come from Mormons—most of the men hired by Marshall were of that faith—to Sam Brannan, the chief representative of their church in San Francisco, the owner of the *Star* and one of the leading business men of the village. In announcing his rural trip, Edward C. Kemble, the editor of the *Star*, said nothing of his destination or of the gold, and his silence upon these points suggests a fear that he might be laughed at for going off on a wild-goose chase. He went to Coloma, where Sutter and P. B. Reading were with him, and they probably accompanied him from New Helvetia. He saw so little or understood so little of what he saw that he made no report in his newspaper of his trip or his observations, and contented himself with a simple statement in the *Star* of May 6th that the editor had returned. No expression of his opinion of the mines escaped from him until the 20th of May, when he said that a fleet of launches left San Francisco on the 14th and 15th of the month, laden with "superlatively silly" people who had gone off with the supposition that the gold mines were so rich and extensive that 2,000 men could find room to each dig two ounces a day; and he added, "we believe the reputed wealth of that section 30 miles in extent all sham." How can anybody accept the doctrine of journalistic infallibility after such a mistake as that?

Kemble's blunder, however, was not very astonishing. He was a young man, unacquainted with mining. Shallow placer washing, as then conducted at Coloma, makes little impression on the mind of the inexperienced observer, who sees a dirty man rocking dirt in a dirty cradle, into which he pours dirty water with a dirty dipper, occasionally stopping to mash the lumps of clay in the hopper with his hands or to rake out the larger stones from the muddy mass with his fingers. The sight does not fill the aesthetic eye with delight, especially when the miner conceals the result of his toil from the spectator, as he can without difficulty, and as he nearly always does, from motives of prudence. The concentrated sand taken from the bottom of the rocker is put to one side until after the departure of any visitor who shows a meddlesome interest in other people's business, and if the diggings are good, panning out, reserved for the exclusive enjoyment of those entitled to participate in it, is the pleasantest part of the day. Many of you, my fellow pioneers, remember it with satisfaction; you delight in recalling those golden days, unsurpassed in their wonders and excitements by anything recorded in history or invented in fiction, probably never to be repeated in actual life and ever to be preserved in fond memories while we live.

Mistakes like those of Kemble's were not limited to inexperienced men. In 1849, every auriferous district had miners who declared that all the rich ground in the vicinity had been taken up or worked out; that there was no chance for a new-comer to make a living. I often met and heard of such men: In the beginning of October, 1849, a party of raw immigrants who had just arrived overland, going to Reading's Diggings, as the placers in what is now Shasta county were then called, camped for the night on the bank of Cottonwood creek, and soon afterwards saw several wagons, with six or eight men coming from the mines, stop near by. After supper the new-comers went in a body to the other camp to get information. The accounts given to them were of the most dismal description. The diggings were exhausted; the miners generally were not making expenses and were staying in the hope of finding something better; the stock of provisions was insufficient for the winter and the approach of the rainy season would render it impossible to get more before spring; the few rich claims would be worked out within a month and starvation or great misery was inevitable. Questioning elicited much variety of opinion among the party on minor points, but they agreed that they were all disappointed in Reading's Diggings, that the rich ground was small in area and all occupied, that it would be impossible to obtain additional food supplies after the rains came, and that they were glad they would get to the Yuba, where the mines were rich, before the roads should become impassable. After the immigrants had obtained the information, they returned discouraged to their own camp, and for several hours seriously discussed the question whether, though only two days from Reading's Diggings, they should not turn back and seek their fortune elsewhere. They did not doubt the sincerity, the laborious habits, or the sobriety of their advisers, but others equally as honest and perhaps as well-informed, had expressed different opinions, and they determined to go on. The result was that though their labor for the first week were very unprofitable and discouraging, they soon found that the district was rich and abounded with gullies, bare flats and hillsides where the miner could average two ounces a day. The diggings were shallow, the returns were immediate; the gold was evenly distributed over a considerable territory, water was abundant, and there was no lack of provisions, though beans, bacon, flour, dried apples, coffee, sugar and rice, which were the chief articles of food, were sold at the uniform price of \$2 a pound. This high figure did not incommode our party—I was among them—for we had sent a wagon to Sacramento for a winter's supply, and besides could eat beans at \$2 pound with satisfaction when we were taking out two ounces a day.

(Concluded next week.)

MECHANICAL PROGRESS.

Hints on Welding.

A correspondent of the *Wheelwright and Blacksmith* furnishes that journal with the following hints on welding:—Iron-work should always be laid down by the smith red hot, and allowed to cool gradually, and not be cooled suddenly by immersion in water, as it then assumes a crystalline form to a very great extent. But if it is necessary to cool the iron in order to forward the work, it should be made red hot the last thing, and allowed to cool, so that the molecules of the iron shall again assume their normal condition and position, before being strained and tested by work.

It has been said that sand is used as a flux, but whether it is of any use in assisting the iron to assume the semi-fluid state necessary for welding, I am myself rather doubtful, as I know several smiths who never use sand, and I have frequently made good sound welds without its aid, and have not experienced any difficulty. For myself, I find it useful for the purpose of enabling one to get two pieces of iron to be welded about the same heat, for sometimes I find that one piece of iron will get heated quicker than the other, maybe by reason of difference in their sizes, or their position in the fire, and by plunging the hottest piece into the sand, it immediately loses some of its heat by imparting it to the sand, but whether it can be called a flux in the same sense as spirits of salts or resin is to solder, or borax to brass, or limestone to iron ore, I am not aware, but my belief is that it is not.

Steel, though analogous to iron, is more of a composition, as I mentioned before, and the carbon which it contains makes the difference between iron and steel, and also makes it needful to exercise much greater care in the heating process, especially when welding; indeed, it is difficult to weld cast-steel at all, and the welding of cast-steel has led to a great many arguments and debates as to whether it can be welded or not after it has been welded. As I have not heard of anyone claiming to weld cast-steel without the aid of some composition or other, and the action of these compositions is, by their affinity for carbon, and being subjected to great heat, that chemical action takes place, and some of the carbon is extracted, and given off in fumes, and I take it that this carbon is the virtue of the steel, and by extracting some of it, I argue that it cannot be steel to the same degree as it was previous to the welding; but I have recently read in a periodical called *Iron* (which is a magazine of the first class) that cast-steel has been welded, and subjected to all possible tests, and no appreciable difference could be found in the quality or strength of the steel, and, on the authority of this magazine, it appears that this vexed question of the practicability of welding cast-steel has been settled conclusively, but this was also done with a composition, the ingredients and quantities being given. The steel used for spring making is not so highly converted as that made for tools, but still requires great care in welding on the heads, etc. The heat for drawing the points may be described as a pale yellow color; the heat for fitting is as left after tempering. A test for tempering usually employed is to rub a dry ash stick on the steel till it blazes; they are then considered (technically speaking) low enough, but this depends on the judgment and experience of the spring maker, for the kind of steel used, also at what heat the steel is when plunged into the water, and also at what heat the water is when the steel is plunged into it; all influence, to a certain extent, the temper of the steel.

In making welds or shuts in iron or steel, a certain amount is allowed for making the weld, as it has to be upset, that is, made larger by being struck by the hammer or compressed while in a heated condition, and should be lapped short enough, as in the process of hammering together it will draw or elongate, and allowance has to be made for this or the length of the piece of work will not be accurate when finished, and care should be taken to have enough stuff, for if not you would be able to draw it long enough, but it would be at the expense of the width and thickness of the iron, which would, of course, be bad work.

A NEW PROCESS FOR TOUGHENING STEEL.—The French Société d'Encouragement have had under prolonged examination a process invented by M. Clemandot for working steel. The process is described by the *Revue Industrielle* as consisting in heating the metal until it acquires a sufficient ductility, and then subjecting it to a high pressure during cooling. In this way a modification of the structure of the metal is produced, and the material acquires properties analogous to those developed by tempering. Similar processes have been tried in France, but only upon the same principle, that is to say, by operating upon the metal while yet in a state of fusion. M. Clemandot, on the contrary, takes steel already made, heats it simply to a cherry red, and submits it, by means of a hydraulic press, to pressures of from 1000 to 3000 kilos. per square centimeter. After having allowed the steel to cool between the two plates of the press, it is withdrawn with all its new qualities developed, and does not require any further treatment. The result of the process is to impart to the steel a fineness of grain, a degree of hardness, and a notable accession of strength to withstand rupture.

This alteration is most considerable with highly carbonated steel, and in this respect the metal is made to resemble tempered steel, without being in all points identical with it. The cause of this alteration in physical condition is ascribed to the rapid heating and no less rapid cooling of the metal. When the red hot steel is first strongly compressed, the conversion of the mechanical energy into heat serves to raise the temperature of the entire mass, at the same time that the particles of the metal are more closely cemented together. This effect is followed by a rapid cooling, due to the contact of the plates of the hydraulic press with the surface of the metal. The close pressure materially increases this conducting effect of the cold metal.

GALVANIZED IRON WATER-PIPES.—In the course of a paper on the above subject by Dr. F. P. Venable, in the *Journal of the American Chemical Society*, he states that it has long been known that zinc dissolves in water, and that soft water, such as rain-water, dissolves it more easily than hard water. Water containing carbonic acid is especially able to dissolve it. The use of galvanized iron for pipes and tanks being so much on the increase, the subject becomes more and more important, and it is desirable to ascertain as far as possible, to what extent solution of the zinc coating takes place, and how far water contaminated by zinc is injurious to health. The author quotes several investigators as to the latter point, the evidence being to some extent conflicting, but giving a very decided balance on the side of the view that such water is considerably injurious. Investigations made on behalf of the French Government resulted in the prohibition by the Ministry of Marine of the use of galvanized iron tanks on board men-of-war. Professor Heaton has given an analysis of a spring water, with a further analysis of the same water after it had traveled through half a mile of galvanized iron pipe. It had taken up 6.41 grains of zinc carbonate per gallon. Dr. Venable gives the results of an observation of his own, where spring water passed through 200 yards of galvanized iron pipes to a house, and took up 4.29 grains of zinc carbonate per gallon. It therefore seems pretty clear that drinking water should not be allowed to come in contact with zinc.

MAKING LEAD SHEETS BY HYDRAULIC PRESSURE.—We learn through *Engineering* that J. Brundt, of Berlin, proposes to make sheet-lead by hydraulic pressure in a manner similar to that in use for making lead pipes, instead of by the present method of working down a large block of lead to the required thickness by means of rolls. The receiver for the lead is made of such a length as may be required for the greater width of sheet which it is proposed to make. The bottom of the receiver is connected to the pistons of several hydraulic rams, and slides up and down in the receiver. A part of the top of the receiver consists of movable jaws, whose distance apart can be nicely regulated by rack-and-pinion arrangement. These jaws being opened sufficiently wide, a charge of molten lead is run into the receiver, and then the jaws are closed to an opening corresponding to the thickness of sheet required. When the lead has cooled to the point which experience shows to be most suitable, the hydraulic pressure commences, and the lead is slowly squeezed out in the form of a sheet.

SELF-HARDENING STEEL.—It is stated that Mr. Adam Tindel, of the Frankfort Steel Works, Philadelphia, is producing a tool steel which possesses remarkable qualities. Its chief peculiarity consists in its being self-hardening. No process of hardening in water or other liquids nor of subsequent tempering is necessary in its use. A tool from Mr. Tindel's steel is shaped over the anvil as with ordinary tool steel. When the tool is forged it is laid aside to cool in the air. When quite cold it is found to have taken a hardness exceeding that of any steel hardened by the usual process of immersion in water or brine. So hard it is that the teeth of a Stubbs file will be turned by a single stroke across it, and the edge of a finely-tempered cold-chisel completely destroyed in an attempt to cut it, not the slightest impression being left on the Tindel steel. Another peculiarity of the metal is its ductility in forging. It forges and welds to iron quite as readily as tool steel. At the usual heat no difference can be perceived in its capacity for being drawn, bent or tortured from any good quality of cast-steel.

HOW "HARD TIMES" SPOILS WORKMEN.—"Hard times" are apt to be hard on nice, delicate workmen. Perhaps business gets so dull that a nice tool maker must go to work repairing old engines. For a time he uses tools tenderly. He is as careful with them as of old. It makes him wince to see the boys throw nice tools into a box, and then dump them into a drawer or on the bench. Soon our man gets hardened. He begins to "don't care," and quickly gets as bad a tool smasher as any of the gang. "Hard times" not only spoil business, but they sometimes spoil the mechanic as well.

WIRE BELTS.—One of the new uses to which it is proposed to apply steel wire, in a braided or woven form, is for belting for driving machinery of all kinds.

MR. BESSEMER'S steel process patents have yielded him \$600,000 a year for 21 years.

SCIENTIFIC PROGRESS.

Liquid Air.

The electric light and the telephone have been so noisily and repeatedly thrust upon the public notice that the knowledge of them has penetrated every nook and corner of Europe and America; and he who is ignorant of their existence is the just subject of jeers and ridicule. But to call a man an ignoramus because he may not happen to know that the air we breathe has been so compressed that liquid air was the result, would be carrying matters too far; for the praises of this latter triumph of science has been confined principally to scientific journals and to papers read before scientific bodies. This triumph, while it does not deserve the attention which the electric light and telephone have attracted by their innate usefulness, still is remarkable enough to be told to and remembered by all.

We have headed our article "Liquid Air," but the scope of the triumph, of which it is a part, extends to even the lightest and most mobile gases; and indeed all the known gaseous bodies which are not decomposed and broken up into other bodies by great pressure have been made to assume a distinctly visible liquid form. Our fathers were no doubt as firm believers in an atmosphere as we are. They could not doubt the evidence of swaying trees and sailing ships as positive proofs of the existence of some invisible, yet none the less actual, fluid surrounding them. But it has been reserved to the people of the nineteenth century to be the first to reduce the air to a form in which it could be actually seen and felt.

This result was consummated in the presence of several reliable witnesses by two French scientists, Messrs. Pietet and Cailliet, during the week between Christmas and New Year's day of 1877, and has since been repeatedly confirmed. Before this time many other chemical gases had been liquefied, but the oxygen and nitrogen of the air together with hydrogen gas and a few others had defied all attempts. Improvements in the way of applying pressure and in the attainment of very low degrees of cold are the secrets of our present success, for on these two simple agencies combined the liquefaction of all gases depends. That pressure and cold should be used in combination is very material as is shown by many cases where very great pressures have been applied to gases without producing the liquid, which, with much less pressure and the requisite degree of cold, was formed most readily.

It seems a rather simple operation, this subjecting of a gas to pressure and cold to produce a liquid; and there is apparently no cause for surprise that air and other permanent gases should have at last been liquefied. The wonder rather inclines the side of the query why they were not liquefied long since. But when the enormous pressure needed and the degree of cold also requisite are stated, the difficulties that attend the liquefaction of gases can be better appreciated. Mons. Pietet in his liquefaction of oxygen used a pressure of more than 5000 pounds to every square inch of surface, and a temperature of more than 200 degrees below the zero of a Centigrade thermometer. Such enormous pressures as the above are liable to result in accident, but the recent apparatus has entirely obviated all risk in the performance of the experiments.

Even the uninformed can understand the possibility of producing all the pressure needed on this work; but how such low temperatures are obtained is a problem. The solution of this problem is not difficult, being dependent on causing the gas to be liquefied to furnish a great part of the cold itself. If air is to be operated upon, the tube in which it is contained under great pressure, is surrounded by another tube containing liquid carbonic acid gas. This liquid carbonic acid gas can be made by pressure and a moderate degree of cold. To freeze the air a jet in the carbonic acid tube is turned on and the liquid gas rapidly rushes out and resumes the gaseous state, and in so doing absorbs enough heat to lower the temperature of the apparatus to 140 degrees below zero. The remaining work is accomplished by then allowing high compressed air to escape.

Improvement in the Uses of Chloroform.

According to *La Nature*, experiments have shown that the vapor of thirty grams of chloroform, mixed with a hundred liters of air, will kill a dog in a few minutes; while a dose three times as strong, if diluted with a cubic meter of air, produces a sleep without danger, lasting two hours. The tension of the vapor, rather than the quantity, determines the effect; but the operator, in administering the anæsthetic, has to take into account the quantity; so that, under apparently the same conditions, very different results are obtained; and hence arises the difference of opinion among surgeons as to its use.

Six grams in a hundred liters of air have very little effect upon a dog; ten grams produce insensibility for an hour and a half; while fourteen grams cause death in forty-five minutes, and twenty grams in five minutes. In the case of man, with an inspiration of half a liter, these results are produced by three, five, seven, and ten centigrams of chloroform respectively. It will be seen that the difference between the harmless and the dangerous proportions is very slight. Accord-

ingly, the use of chloroform has always been considered dangerous; and in order to make it less so, Mr. Paul Bert has made experiments upon animals, and afterward applied them to man. His experiments with man have extended over two hundred cases, including patients of all kinds of temperaments, with always the same result. He uses ten grams of chloroform vaporized in a hundred liters of air—a dose agreeable to some and to none disagreeable. The most disagreeable effects of the anæsthetic have been felt in the period of repulsion; but Mr. Bert almost entirely removes this. The period of excitement is not great, and only lasts from one to two minutes; while in the case of more than one-third of the adults it is entirely absent. The pulse is a little accelerated during the period of excitement, but remains perfectly normal and regular during sleep. Complete insensibility is produced in from six to eight minutes, and is maintained during the whole time of respiration. After the patient becomes insensible, the quantity of chloroform is reduced to eight grams, and later to six. Painful operations have no effect, except that the respiratory movements are slightly accelerated. There is no nausea, and the amount of chloroform administered is not enough to cause poisoning; while there is no fear of asphyxia, for the amount of oxygen is reduced only by a hundredth.

Tree Rings as an Indication of Age.

When Mr. Henry G. Sheppard delivered his last lecture before the pupils of the Carriage Builders' Technical School there was a short discussion between Mr. Fitzgerald and the lecturer with reference to the relations which the rings in a tree bore to its age. Mr. Sheppard thought that the number of these rings always corresponded to the number of years the tree had lived, but Mr. Fitzgerald intimated that this rule was not to be depended on. In this connection it is worth while to mention some recent observation on tree rings by Professor Bachelant. He said that during a visit to the ruins of Palenque, Mexico, in 1859, M. Charnay caused all the trees that hid the facade of one of the pyramids of the place to be cut down. On a second visit, in 1880, he cut the trees that had grown since 1859, and he remarked that all of them had a number of circles greatly more numerous than their age would warrant, supposing one circle only to be added annually. The oldest could not have been 22 years of age, but on a section of one of them he counted 250 circles. The tree was about two feet in diameter. A shrub not more than eight months old had eighteen concentric circles. M. Charnay found the case repeated in every species and in trees of all sizes. He concluded that in hot and moist climates, where nature is never at rest, trees may produce not one circle in a year, but one in a month. The age of a monument has often been calculated from that of trees that have grown on their ruins. For Palenque 1700 years had been calculated, 1700 rings having been counted on a tree. These observations, however, require the number to be cut down to 150 or 200 years. Professor Bachelant asks if M. Charnay took account of certain colored rings which some tropical trees present in cross-section, and which are to be distinguished from annular circles.

PHOTOGRAPHING THE NEBULA OF ORION.—The late Professor Henry Draper was the first to succeed in obtaining a successful photograph of the famous nebula in Orion. Mr. Common, an English astronomer, is interested in the same field of work. He exhibited at a recent meeting of the British Astronomical Society a series of enlargements of photographs of the Orion nebula; taken with different exposures, varying from a few minutes up to sixty minutes. With the longer exposures, the outer and fainter portions of the nebula were shown, but the inner and brighter portions were obscured by over exposure. It was only by a combination of such pictures that the whole of the details visible in the nebula could be studied. With the longer exposures, regions of the nebula invisible to the eye with the telescope register themselves on the photographic plate. Mr. Common had obtained, with an exposure sixty minutes, traces of many stars invisible to the eye. He had not at present tested what could be obtained by still longer exposure. Reliable photographs of the present condition of this wonder of the skies will be an inestimable gift to the astronomers of the future.

THE RADIANT ENERGY OF THE SUN'S SURFACE.—It has been demonstrated that the sun's surface gives out a radiant energy at the rate of 50 horse-power a square inch. It is proposed to utilize this heat for industrial purposes, as for pumping water, propelling machinery, furnishing steam and hot water, for the sublimation of sulphur and the heating of ores. The device is simple; a reflector, cylindrical in form, with a heat receiver mounted on its axis and parallel to it, is so placed that the heat receiver is made to automatically follow the sun's apparent motion. By this means the heat is obtained and utilized.

THE MOST PERFECT INSULATOR.—S. Wroblewski says that liquid oxygen and nitrogen are among the most perfect insulators. The resistance of copper decreases much more rapidly than the absolute temperature, and approaches zero at a temperature not very remote from that obtained by evaporating liquid nitrogen in a vacuum.

Passing Events.

The season for prospecting is about over, and before long those who have been roaming the mountains will have to come into the camps for the winter.

The black sand deposits on the northern coast of Vancouver island are beginning to attract attention.

The discovery of gold on the Chinese side of the Amoor river does not interest miners in this vicinity aside from its interest in the gold product. It is not likely any one will go from here, though already many Russians from the old Amoor gold fields have gone to the new diggings.

At several camps there is an evident desire on the part of mine owners to reduce miners' wages, and there is also a strong disposition on the part of the miners to resist the reduction.

The hottest day of the year was experienced in San Francisco on Monday, the thermometer reaching 87°. In other parts of the State, also, very hot weather has been felt.

Mr. R. G. HUSTON will leave next week for a trip through Idaho and Montana as correspondent for the MINING AND SCIENTIFIC PRESS. He will visit the various districts and mines and write an account of his observations for the PRESS. We hope all our friends will assist Mr. Huston in obtaining the information he desires concerning the mineral resources of the two territories.

THE Manhattan mill at Hamilton, Nev., is working on tailings.

Cable Railroad Patents.

It is surprising to see what a number of "improved" systems of cable railroad construction have come to the surface since cable railroads have proved successful and profitable in this city. Scarcely a week passes that we do not see in the Eastern papers glowing descriptions of plans or systems which are to excel in every way the San Francisco roads. People come here, from Chicago, Philadelphia and elsewhere to see the roads, and immediately think they can make something better. They know theirs will be better without trying them, and somebody seems easily found to pay for the experience. The Philadelphia road, for instance, has practically thrown from \$700,000 to \$1,000,000 into the scrap-heap in trying to carry out an impracticable system of roadbed, etc.

Only last week we saw a description in a New York paper of what was called "a perfect cable road," which is in the hands of the American Cable Company. It proposes to do away with the difficulties of present roads. A prominent feature is to have two cables running all the time, one faster than the other, and either of which may be caught by the grip. This is so that, in case of a jam or block, the cars behind time can catch up. As it has been found by experience here that about 50 per cent of the power required to operate the road is absorbed in moving the cable alone, double cables, with independent supporting pulleys, will be apt to cost something to purchase and keep running. The inventor also has a peculiar roadbed, where he will only have to excavate 18 inches, and no cement need be used, and sand and cobble or macadam will do—a very cheap plan, if it was any good.

Then he has a plan for rounding curves better than one he describes as existing in San Francisco. We have several plans here, all of which work very well. One plan here he described as impracticable, notwithstanding which assertion it has been working several years, without any fault being found in practice. He also has a new form of cable, with a smooth surface and several other novel features. A special thing mentioned is that with the American Co.'s plan no horses need to be kept in reserve; we never heard of any with any of the other cable systems.

Building large and expensive roads on new and untried plans, simply to dodge the royalties on proved systems, has cost companies already hundreds of thousands of dollars. We have gone over most of the ground here already, and if others will only take our experience they will save time, money and trouble.

Because a man invents a thing, patents it, and calls it "improved," it by no means follows that it is better than what is in use. We have more miles of cable road running in this city than in any in the world; we have had the roads longer, we have them under many different conditions; and earlier crudities have been removed. Difficulties have been overcome by experience, and details have been changed to suit circumstances, so that if cable road buildere will come here and see the results accomplished they will do better than to take up with the first wild plan offered, simply because it is new. To their cost the cable road builders elsewhere have found that there are many so called inventors who have no practical knowledge of the subject, and that many of their theories are worthless. Cable roads are too costly to be hurriedly built without well-considered plans, or without some guarantee that the system adopted covers all the points.

Gold in China.

The Russian papers confirm the statement of the discovery of gold on the Chinese side of the Amoor river, and thousands of Siberian gold-diggers have gone to the spot. But the Chinese have also gone there by thousands, and will probably have the best of it. It is stated that the new diggings are of greater extent than the old mines of the Amoor district in Russia, which have yielded largely for years. The Chinese have it in their power, therefore, to greatly increase the gold product of the world. Whether they will let other people work there or not is still to be determined.

The Amoor river is formed by the junction (about latitude 53° N. and longitude 120° E.) of the Shilka and Argoun, which both come from the southwest, the former rising in Russian Siberia, near the headwaters of the Yenisei,

and the latter in Chinese Tartary, not far from the sandy plateau of Kobi.

From this starting place the Amoor presents on its right a tolerably symmetrical curve, which, after receiving at its most southerly point the Songari, from beyond the wall of China, besides other considerable feeders on both sides of either segment, enters in nearly its original parallel, the gulf of Saghalien, about a degree below the Ochotsk sea. The basin of this important river comprehends about 766,000 square miles, and its course is about 2500 miles. Steamboats of light draught ascend it for a long distance. As might be expected in so long a river the climate of its valley varies very much in different parts; in the upper portion of its course there are long and cold winters and short summers; as the river descends into more southern latitudes the rigor of the climate relaxes, and the heat becomes almost tropical; the vegetation is rich and luxuriant; while on the lower Amoor the cold again prevails to a certain extent, and at its mouth the river is ice-bound for more than half the year. Gold has been known to exist in the mountains, and iron is said also to be abundant. The exact locality of these new Chinese mines have not been stated, but they are probably near the deposits which are on the Russian side of the river.

Liquid Fuel.

A few months since we gave an account of the experiments which were being made by the Central Pacific Railroad Company with petroleum as fuel on some of their steamboats. At that time they had tried it upon the freight steamer Thoroughfare, plying between Oakland and San Francisco, and on the transfer boat Solano—the largest ferryboat in the world—on Carquinez straits, running between Benicia and Port Costa.

Since that time they have been able to determine more in detail concerning the results. On the Thoroughfare they saved \$7000 in the cost of fuel in the five months they were using oil as compared with the five months of the same season last year when they were burning coal. Besides saving 44 per cent in actual fuel, they get rid of four firemen, which makes an additional saving of \$240 per month. On the Solano there is not so much saving, the cost being lessened but 17 per cent. She makes short trips, and they burn the fuel while she is in the slip, to generate necessary steam.

The oil costs \$1.70 per forty gallon barrel, or about four cents a gallon. It is estimated by the engineer of the big Water Witch, which is also using oil, though a somewhat different kind from that used by the railroad company, that 100 gallons of oil is equal to a ton of coal, which latter costs about \$7 per ton.

The Oakland ferryboat, Piedmont, has just been altered so as to use the liquid fuel. She has not yet been put at work under the new system, but will be in a few days. The oil is sprayed under the boiler by a steam jet, and is supplied by suitable tanks. A supply tank is kept on the wharf, so that the oil may be led into the steamer's tanks. The supply tank is filled from tank cars, so there is no handling. There is no smoke or soot, and of course no ashes. It is stated that in addition to the lower cost of the liquid fuel, the services of 16 firemen will be dispensed with on the Piedmont. The mechanical alterations to effect the change of system are slight. The other ferryboats will be changed to burn oil shortly.

As the coal used on these steamers was imported, and a good deal of California petroleum will probably be used, the change will be good for this State in utilizing one of its products. The amount of petroleum obtained from California has been steadily increasing for the past five years. In 1879, 19,558 barrels were produced, and in 1884 more than 100,000 barrels, thus quadrupling the yield in the space of five years. California now ranks third among the petroleum-producing States; New York is second, and West Virginia fourth. The petroleum resources of the State are being carefully developed, and the more of the product we can use here the better it will be for California.

SAWTOOTH, Idaho, like many other camps, is in great need of a cheap process for working low grade silver ores. There are hundreds of prospects in the country that have a fair shipment of ore on the dump, but rates are too high.

The Machinery at the Fair.

Although the display generally in the machinery department of the Mechanics' Fair cannot be said to be a representative one of our home manufactures in the machine line, there is much to commend. The large foundries and machine shops are not represented in the exhibits, the dull season probably preventing their going to the expense of displays. In mining machinery there is very little indeed, the dry washing machine for gold placers, Taylor's rock breaker, Macay's filter for leaching process, Stiles' pulverizer, and a machine for transporting dirt by hydraulic power, representing all there is in that line. There are no mills or stamps, no furnaces, pans, settlers, hoisting engines, or any of the miscellaneous mining machinery we might expect. There is this to be said, however: most mining machinery is made to order, and it is mainly of a ponderous character, therefore, it is difficult and expensive to make any special display of this character.

A very fine exhibit is that made by the Dow Steam Pump works. It consists principally of a variety of pumps of different patterns. There is a large tank in the center of the space devoted to these pumps, into which they discharge, and as they are operated during running hours, they attract considerable attention. One powerful pump is the pattern intended for water-works. It is a compound pump, with outside packed plunger. This is the first of the kind ever made here, being entirely new to this coast. There is also exhibited one of the Dow artesian well pumps, a type which is meeting with much favor. The mining-sinking pump made by this firm is also shown. The other pumps are all of California design and manufacture.

Opposite this display is that of Kryger, the flour mill builder. He shows the Livingstone roller mills, of different sizes; the American turbine wheel, the Gilbert four and six reduction mill, Hoyt's belting, and other articles used in modern flour-mills.

Thompson & Evans have a display of their well known and popular fly wheel pumps, which we have before described in these columns.

Running the Keith dynamo machine is one of Parke & Lacy's Westinghouse engines, a compact and easily-cared-for engine, which we recently illustrated in the PRESS. It runs smoothly and noiselessly, and seems just the thing for dynamo work.

The Brush dynamos are run by one of the well known Ohmen engines, designed and manufactured in this city. These engines are extensively used here, and have met with great favor from their economical results.

Mr. Denniston, of the San Francisco Plating Works, has a large silver-plated amalgamating plate. This appliance is one now used at all first-class works in the United States, and has also been adopted in foreign countries. It is found to be very much more efficient in saving precious metal than ordinary copper plates, besides being much less trouble to take care of. Mr. Denniston has deservedly won reputation in the manufacture of these plates, and has built up a large trade in them.

Palmer & Ray, who are now manufacturing printing presses in this city, exhibit several specimens of their handiwork in this line, and also type and printers' material.

John Taylor & Co. have quite an exhibit of assayers' material, such as assay balances, tongs, black-lead crucibles, English and French crucibles, English and French muffles, grinding plates, mortars, hullion molds, chemical glassware in great variety, etc. A prominent feature is the Taylor rock-crusher, for the use of prospectors and assayers for crushing old crucibles, working specimen ores, etc. This machine crushes much faster than the hand mortar and pestle, because of its great leverage and power. It will enable a person to quickly and easily bring to fine powder the hardest ores to be assayed, sampled or crushed. Exhibited with this are the tools to accompany it for prospectors' use, such as a pole, pick, Attwood's combined hammer, rock-splitter, foot-measure and walking stick, sieves, rubber sheet, wooden batea, Buck's patent amalgam mortar, magnets, miner's pan, miner's horn, a gold-dust blower, etc.

Another thing they have there is a prospector's set. This is a little kit of tools and chemicals to enable the prospector (without be-

ing a chemist) to make a quick and correct test of gold, silver and copper. In it is a hammer, with one face flat and the other wedge-shaped for splitting rock, one iron mortar and pestle, magnifying glass, sieve, ore measure, acid measure, spirit lamp, 12 test tubes, test tube holder, glass funnels, package filter paper, bottle nitric acid, bottle ammonia, chloride of tin, alcohol, small box of salt, etc. All the above are packed in a small box, 16 inches long, 8 inches wide, 9 inches high, with hinged lid, lock, and leather strap. It weighs, complete, 15 pounds, and is sold for \$8, with full printed directions.

H. P. Gregory & Co. have quite an interesting display. In it is a 25-horse power Atlas engine, with the latest improvements in the shape of an automatic cut-off. There is also one of the latest improved Blake's Duplex pumps, of which Messrs. Gregory now carry a full line. The most interesting feature of the exhibit is the Otto gas engines, of which there are several sizes. One of these is a 15 horse power double cylinder Otto, and there is also a 7-horse power engine and pump combined, designed especially for raising water for running elevators. One of the small Ottos used in printing offices and for other small power is also shown. We are informed that none of these Otto gas engines use over 20 cubic feet of gas per indicated horse power per hour. A 10-horse power engine running 10 hours per day with gas at \$2 per thousand feet, will cost about \$4 per day. Altogether, there are over 80 of these gas engines in this State, doing various kinds of work. They are most extensively used in repumping water for elevators. By their use such places as boarding houses, etc., are enabled to afford to run elevators. In some places where, with Spring Valley water at 20 cents per 1000 gallons, the cost was \$158 per month when the elevator was put in, the expense was reduced to \$40 per month. In no case is skilled labor employed to run these engines, they requiring no attention beyond cleaning once or twice a week.

The San Francisco Tool Company have a very creditable display of tools of their own make. There is one large centrifugal pump which is capable of pumping 120,000 gallons per hour. It is in operation and throwing a splendid stream of water. It is run by a 6-inch single acting engine. A 7-inch single acting engine of the Tool Company's make is running a dynamo which supplies power for sewing machines, a pump, etc. In the display are drill presses, lathes, different sized pumps, couplings, valves, hangers, etc., all made in this city. There is also one of Bishop's elevators for warehouse work, made by the San Francisco Tool Company. The pumps and engines shown are made in any size from 8 to 20 inches.

Macay's rotary deaerating filter is also exhibited in the machinery department. It is intended for dissolving and filtering in chemical and metallurgical processes.

This apparatus is applicable to the extraction of silver, copper and gold from its ores by any leaching process; for the extraction of nitrate or potassa or soda, and also in chemical industries, for washing precipitates and separating the liquid by filtration in a rapid and effective manner. In the extraction of gold, silver and copper by its respective leaching processes, three washings and three filtrates, charging and discharging, can be done in four and a half hours, and it will extract 99 per cent of the soluble metals present in the ore, no matter in what state of division the ore may be, or whether it contains talc or slimes in any quantity. In the extraction of silver by the leaching process, from \$1.00 to \$1.50 per ton is saved by the use of this apparatus, as compared with the common leaching tubs. The apparatus can be made to hold from one to seven tons of ore per charge.

Tatum & Bowen show the well-known Hoe chisel tooth saw, Hoe printing presses and the Davey safety engine, the latter in operation. The Davey safety engine differs from a steam engine in the fact that while a small quantity of steam is used, steam is not the motive power employed to do the work, and only as much is required as would be generated in an ordinary tea kettle, and this at only atmospheric pressure; that is, at the same pressure at which it would flow from the spout of a tea kettle or escape from under the cover of a wash boiler, or from under a pot lid. The only function of the steam being to create, by condensation, a

vacuum, which is the motive power. There is absolutely no pressure in the generator, and consequently can be no danger of explosion, under any circumstances whatever. The quantity of water consumed by this engine is very small, only a few gallons per horse power per day, and this may be returned and used over and over again. The cylinder, unlike that of other engines, does not require any oiling or lubrication, being made of bronze, with bronze piston-head and rod. In fact, it is intentionally constructed so that oil cannot be put into it. Unlike an ordinary boiler and engine, in which

Ore Jigging Machine.

At Příbram, Bohemia, they have one of the most extensive ore dressing establishments ever built, and carry on the works on a very large scale. In the matter of ore dressing machinery they have had great experience. We have before described some of the machines, and herewith present engravings of what is known as the "middle jigging machine" for working the 4 mm. stuff. The engravings show the detailed construction in plan and section, and are described by Ellis Clark, Jr., in the transactions

SECTION OF JIG.

JIGGING MACHINE FOR CONCENTRATING ORES.

the water level in the boiler is a matter of vital importance, and any failure of the water supply fraught with more or less danger, the water level of the safety engine is constant and unvarying, and the quantity of water actually consumed so small as to remove all difficulty of keeping up a supply.

Aside from the question of danger attending the use of the ordinary steam engine under careless management, there is probably no one thing which will commend this motor more strongly than the fact that it requires no attention beyond simply lighting the fire, and giving the wheel two or three turns when ready to begin operations. There is no safety valve, no exhaust, no steam gauge, no gauge cocks, no boiler-feed pump or injector, or any of these adjuncts of an ordinary steam engine.

SOME men from San Bernardino county are prospecting Shasta county for tin.

of the American Institute of Mining Engineers. At the head of the jig is a self-feeding apparatus, *A*, worked by a rubber buffer and a cam, *C*, receiving its power from the shaft, *S*. The sieves of 3 mm. (0.12 inch) mesh rest on a slightly inclined wooden grate, which is 36 inches long and 18 inches wide. The jig boxes, *D*, below the sieves are pyramidal in shape, thus preventing the accumulation of material on the sides, as frequently occurs in the case of round bottoms. The piston is constructed of 4-inch timber, its upper surface being on the same level as the sieve, which is thus always covered, preventing the swashing of water and sucking down of air. Each piston is suspended by connecting rods from two eccentrics, the stroke of which can be regulated at pleasure between the limits of 0 and 1.5 inches. The water used in the process passes into the water-box, *E*, one side of which acts as a screen, thus preventing particles of material from passing

into the pump by which the water is lifted out.

This pump consists of a propeller keyed to the foot of a vertical axle, which receives a rapid motion of 220 revolutions a minute by means of the friction wheels, *F* and *G*. It lifts the water from 8 to 12 inches to a sieve for the purpose of freeing it from all foreign matters, such as chips, etc. The water is then conducted through the distributing box, *H*, to the piston boxes of the jigs. During the operation a small quantity of water is necessarily lost; this is replenished from time to time by means of fresh water admitted through the pipe, *I*. The surface of the friction wheel, *F*, is covered with leather so as to produce a better friction, and the wheel, *G*, is slightly bevelled. These two wheels can be brought into closer contact by means of a screw cut on the power shaft in a direction contrary to the motion. The sterile portion of the material passes into the foot of a cylindrical cast-iron trough, set at an angle of 25°, containing an archimedean screw set in motion by spur gearing, by which it is lifted into a car. The diameter of the screw is 8 inches, and that of its axis 2 inches; it has a pitch of 4 inches, and makes 40 revolutions a minute. The material passing through the screen accumulates in the boxes, *D*, from which it is withdrawn from time to time into receivers. The coarser material remaining on the screens forms a bed, the thickness of which can be regulated by raising or lowering, by means of thumb-screws, a sheet-iron cylinder, 10 inches high and 6 inches in diameter. When a sufficient amount of the enriched material has collected on the sieve bottom, it is drawn off through the discharge pipes, *P*, which are from 1.5 to 2.5 inches in diameter.

At the bottom of this discharge is a valve arrangement (moderator) by means of which the outflow of material is regulated. The material from the first sieve passing through the discharge-pipe, as well as that passing through the sieve, is sent to the smelting works. The material passing through the discharge-pipe of the second sieve is sent to the crushing mills, while that passing through the sieve is reconcentrated on fine jigging machines. Stuff from 4 to 12 mm. (0.16 to 0.46 inches) in diameter (*crash-granular*) is generally worked on this jig. Material of 4 mm. requires 160 strokes of 1 inch a minute, and produces 17 cubic feet of concentrated products an hour. The propeller-pump lifts 3.4 cubic feet of water a minute. Material of 12 mm. requires 160 strokes of 1.5 inches a minute, and produces 27 cubic feet of concentrated material an hour. In this case the pump lifts 6 cubic feet of water a minute. In both cases 0.75 horse power is required.

The sterile material which passes away from this jig (*berge*) is exceedingly poor, containing only from 0.25 to 0.37 per cent lead, and 0.004 to 0.005 per cent silver. The amount of water wasted is from 0.75 to 1 cubic foot a minute. In the case of the 4 mm. stuff, the concentrated material from the discharge-pipe of the first sieve contains 0.567 per cent silver, and 51.62 per cent lead; that from the discharge-pipe of the second sieve, 0.046 per cent silver and 3.12 per cent lead.

In the case of the 12 mm. stuff, the concentrated material from the discharge-pipe of the first sieve contains 0.61 per cent silver and 72.75 per cent lead; that from the discharge-pipe of the second sieve, 0.05 per cent silver and 437 per cent lead. The 12 mm. stuff before concentration contains 0.042 per cent (13½ oz. to ton) silver and 4.25 per cent lead.

SIERRA COUNTY MINES.—We have received word that the Bald Mountain Extension Company's clean-up last week was 146 ounces—\$2,712.60—making for the past four weeks' work on the Extension ground a gross yield of \$17,715.66. There will be two more clean-ups this month, and the current expenses of the month are not much over \$5000. The Cornish 10-inch pump when received at the Pliocene shaft will cost from \$2000 to \$2500. The company has purchased the creek with all the accumulated tailings of the lead for the past two years and a quarter. The prospect is fair now that times this winter will be booming at the Extension.

THE MECHANICS' FAIR.—The premium list of the Mechanics' Fair is not yet complete, as all of the committees have not so far reported. As soon as it is complete we shall publish it in full. The Fair closes this week.

PRACTICAL HYDRAULICS.

NUMBER 3.

PRINCIPLES OF HYDRAULICS.

[Written for MINING AND SCIENTIFIC PRESS by P. M. RANDAL.]
[COPYRIGHTED.]

$Q=10.22$ cubic feet flow per second, which is five and two-thirds per cent more than obtained by Rule 11, derived from the formula in accordance with experiments of Francis.

This discrepancy would seem to arise mostly from the correction introduced in our rule to compensate for end contracting.

The length of weir being 3.01 feet, and the depth of water on crest .545 feet, the discharge by Rule 11 or formula (28) amounts to 3.887 cubic feet per second, and by Weisbach's formula 4.253, which latter is nine and one-half per cent greater than obtained by Rule 11, or formula 28.

Again, the length of weir being 3.01 feet, and the depth of water on the crest .189 feet, the discharge per second, by Rule 11, amounts to .8133 cubic feet, and by Weisbach formula .753 cubic feet, which latter is nearly seven and one-half per cent less than the discharge obtained by Rule 11 on formula (28).

In the foregoing examples, the length of weir, the respective depth of water on the crest, and the corresponding coefficient of discharge, are given as the data and results of actual experiments made by W. R. Johnson, editor of the first American edition of Weisbach's Mechanics.

The experiments of Professor Johnson are entitled to great consideration. Those of Mr. Francis, however, from which formula (28), or Rule (11) is derived, were conducted on a large scale with extreme care and with the aid of the most improved mechanical appliances, so as to commend their results as the best authority known at present in weir measurement.

In addition to the variation expressed by the factor $(l-0.1nh)$ in formula (28), the coefficient of discharge is found to vary with the head or depth of water on the crest of the weir.

To compensate for this variation, Table 1 is given, to be used with formula (28).

TABLE 1.

WEIR COEFFICIENTS.
Water Supply—Engineering J. T. Fanning.

Depth in feet.	1	1½	2	3	4	6	8	10
Coefficient.....	.083	.124	.167	.25	.333	.500	.667	.833
Depth in feet.	12	14	16	18	20	24	30	48
Coefficient.....	1.000	1.167	1.333	1.500	1.667	2.000	2.500	3.333
Coefficient.....	3.339	3.339	3.400	3.339	3.339	3.338	3.334	3.331

The mean coefficient, as given in formula (28), is 3.33. The maximum, as seen by Table 1, is 3.34.

The mean coefficient 3.33 corresponds to the depths .523 feet and 3.42 feet.

A comparison shows that the mean coefficient is three-tenths of one per cent (.003) less than the maximum, two per cent greater than that corresponding to a depth of one inch or 0.083 feet; four-tenths of one per cent (.004) greater than that due a depth of four feet; and nine-tenths of one per cent greater than due a depth of one-fourth of a foot. The greatest variation occurring in the coefficient of discharge for different depths, between four feet and one-fourth of a foot, is seen to be below one per cent. An equal variation, for the most part, in practice, is likely to occur from various other causes, and too often elude the observation of the engineer.

Ex. 16.—The length of a weir being six feet, and the full depth of water over the crest two inches, what is the discharge per second?

Cal.—By formula (28) modified by Table 1.
Loss in this case by two end contractions.
2 inches=.167 feet; .167×.2=.0334.
6—.0334=5.9666 corrected length.
(.167)²=.06824, square root of cube of given head.
3.285=coefficient as per Table 1, due head of two inches.

$Q=3.285 \times 5.9666 \times .06824=1.307$ cu. feet.—*Ans.*

Ex. 17.—The length of weir being 10.8 feet, and full depth of water over crest four feet, what is the discharge per second?

Cal.—By formula (28) modified by Table 1.
10.8—4×.2=10. corrected length of weir.
(4)²=8, square root of cube of given head.
3.317=coefficient as per Table 1, due head of four feet.

$$Q=3.317 \times 10 \times 8=265.36 \text{ cubic feet.} \text{—Ans.}$$

TABLE II.

Flow for given depths over each lineal foot of a rectangular weir.

.44	.9717	1.1	3.5522	4.0	26.5360

To obviate the use of a formula so encumbered, Table 2 has been computed. In which the 1st, 3d and 5th columns represent the heads or depths in feet, from the level of still water to the crest; the 2d, 4th and 6th columns represent the quantities discharged per second, for the given depths over each lineal foot of weir. These quantities are the products of the unit length, cubes of the square roots of the given depths, and their respective variable coefficients found in Table 1. If Q denote the tabulated quantity,

so discharged per lineal foot, h , the given head, and c , the variable coefficient due that head, then we shall have the formula by which Table Q has been computed, viz.:

$$Q=c, h^{\frac{3}{2}} \quad (29)$$

Multiplying (29) by $(l-0.1nh)$, the factor for correcting length of weir as in (28), and putting Q equal discharge over a weir whose length is three or more times the depth of water on crest, and there results:

$$Q=Q(l-0.1nh)=c, (l-0.1nh)h^{\frac{3}{2}} \quad (30)$$

Whence, to find the discharge of water over a weir, with corrections made due variable coefficient, and depth on crest.

Rule 12.—Deduct from the given length of the weir one-tenth the depth of water on the crest, for each and every end contraction, and multiply the length so corrected by the quantity in "flow" column opposite the given head in Table 2.

Rule 12 is derived from Eq. 30—middle right hand member employed. The extreme right hand member of the same equation expresses the value of Q in terms of the corrected length, and the head and the variable coefficient as found in Table 1.

This, in fact, is the modified formula of (28), by which examples 16 and 17 were solved.

Ex. 18.—The depth of water being two feet over a crest seven feet in length, what is the discharge?

Cal.—By Rule 12.

$$7-2 \times .2=6.6 \text{ feet, corrected length.}$$

BY TABLE 2.

9.4299 cubic feet=discharge due head of two feet. Whence, $9.4299 \times 6.6=62.30$ cubic feet.—*Ans.*

Cal.—By formula (30), extreme right hand member.

$$7-2 \times .2=6.6 \text{ feet, corrected length.}$$

$$(2)^{\frac{3}{2}}=2.8284=\text{square root of cube of depth.}$$

$$3.338=\text{coefficient by Table 1, due head of two feet.}$$

$$Q=3.338 \times 6.6 \times 2.8284=62.32 \text{ cubic feet.} \text{—Ans.}$$

The calculation in which Table 2 is employed, is seen to be much shorter and far more simple than that in which Table 1 is employed.

Weirs are usually constructed with horizontal crests and vertical ends, forming a notch, through which the flow of water is measured in its passage from a reservoir, or other storing place; or in its passage over a submerged dam across a flume, canal or natural stream. A weir should be free from vibration. Its crest and ends should be chamfered on the downstream side to an edge—say one-tenth of an inch

thick. Its upstream face should be vertical, and its downstream face, so inclined or fashioned as not to resist the flow of water. On the upstream side, the depth of water below the level of the crest should be fully twice as great as the head of water on the crest. The head or depth is the vertical distance, as AC , Fig. 2, between the crest and the level of still water at a point some distance above the weir, as at a . In ordinary practice, the head is measured with a common rule or linear measuring scale, from the top of a post, P , in Fig. 2, set level with the crest. If greater accuracy is required, the "Boyden Hook Gauge" should be employed. Care must be taken that the flow over the vein shall not be affected by the approaching stream. The area of the weir opening should not exceed a fifth part of that of the supply stream. With proper care in taking the data, the weir affords very accurate means of measuring the flow of water.

This, taken in connection with the weir's simplicity and facility of construction, cheapness and wide application, renders it of great practical importance, especially to those concerned in the measurement of flowing water, in places of difficult access. A temporary dam, in illustration, built across a natural stream, with a crest board firmly fitted, level and vertically widthwise to the dam's top, makes a good measuring weir. In flumes and canals, measuring weirs can obviously be constructed with equal facility.

The weir crest being about three feet wide and level, with a rising incline to its receiving edge, Mr. Francis offers the following formula, for approximate measurements, for depths between six and eighteen inches:

$$Q=3.01208 H^{1.53} \quad (31)$$

As this formula is somewhat complicated, the writer would present Table 3, computed from it, which will be found far simpler and less tedious of application.

TABLE 3.

Flow for given depths over each lineal foot of weir, with crest three feet wide.

Head.	Flow Cubic Feet	Head.	Flow Cubic Feet	Head.	Flow Cubic Feet
6 inches.	1.043	10.5 inches.	2.445	15. inches.	4.238
7.5 "	1.467	12 "	3.012	16.5 "	4.903
9 "	1.939	13.4 "	3.607	18 "	5.601

The depth on head being given.

TO FIND THE FLOW OF WATER OVER A WEIR WHOSE CREST IS THREE FEET WIDE.

Rule 13.—From "flow" column, opposite the given head in Table 3, take the number representing the discharge in cubic feet over one lineal foot, which multiply by the given length of the weir.

Ex. 19.—The head being 15 inches, and the length of weir, whose crest is three feet, being ten feet, what is the approximate discharge in cubic feet per second?

Cal.—In Table 3, in "flow" column, opposite 15 inches, given head, find 4.238 cubic feet.

$$\text{Whence, } 4.238 \times 10=42.38 \text{ cubic feet.} \text{—Ans.}$$

TRIANGULAR WEIRS.

A triangular form of measuring weir has been employed with favorable results.

To determine the flow of water through a triangular weir:

Let $h=BC$ represent the head of water in feet, from the apex C to the level, AD , of still water.

p =given ratio between the head, h , and the width of the weir—that is, let $ph=AD$, EF , or any width taken at pleasure.

c =coefficient of discharge.

Q =quantity of flow in cubic feet.

x =any portion of the head h .

$2g$ =force of gravity= 32.2 .

v =velocity due $(h-x)$.

Then in general by (13) will $v=c(2g)^{\frac{1}{2}}(h-x)$ (32)

$$dQ=pc(2g)^{\frac{1}{2}}(h-x)^{\frac{1}{2}}dx \quad (33)$$

Integrating (33) between the limits of $x=0$ and $x=h$.

$$Q=\frac{4pc}{15}(2g)^{\frac{1}{2}}h^{\frac{5}{2}} \text{ cubic feet.} \quad (34)$$

QUADRANTAL WEIR.

In a quadrantal weir—that is, a weir in which the angle $ACD=90^\circ$ —a right angle— $AD=2BC=2h=p$; hence $p=2$. Making $c=.616$; $(2g)^{\frac{1}{2}}=8.025$,

Our Trade With Venezuela.

From all accounts it appears that the people and government of Venezuela manifest a decided preference to trade with the United States in preference to any other country. As an evidence of this preference is the fact of the offer on the part of that government by special concession of the entire basin of the Orinoco—a most magnificent valley—for development by citizens of this country. The Government is anxious to have this valley properly improved, and it prefers to offer special inducements to citizens of this country to settle there, because of their energetic character and their readiness to conform to the laws and customs of the country; and furthermore they prefer this alternative rather than encounter the hazards arising from internal insurrections among their own countrymen. A liberal sprinkling of American capital and American labor, they think, will no doubt also have a powerful influence in producing stability in both political status of the country and in its industrial relations. There can be no doubt as to the partiality of the Venezuelans for the United States, and we have only to exert ourselves in the right direction in order to build up a very remunerative trade with that growing country, so rich in its natural productions. As a guide to what is needed to be done on our part, we give the following extract from a late Venezuela letter to the *Boston Herald*, evidently written by some one connected with the Congressional Committee which recently visited South America:

Standard Complaints Against American Manufacturers.

"I went into the great dry-goods house of H. Rohl & Co., in Caracas, the other day, and was shown a pile of cotton drillings as big as a haystack, every piece being marked 'Best American Drillings, Massachusetts, U. S. A.," when not a yard of it came from the United States, but every thread of it from Manchester, England. Mr. Rohl very frankly explained that the trademark was fraudulent, and was placed upon the goods to deceive the people who want American goods.

"But why don't you buy them in America?" I asked.

"Because the manufacturers in America will not fill my orders," said Mr. Rohl. "I have tried them over and over again, and was finally compelled to send to Manchester for the goods, and have them labeled with bogus trademark. The trouble is that the cotton manufacturers of the United States have not wanted our trade enough to comply with the peculiar demands of this country. These drillings are used for clothing almost exclusively by the common people, and I sell thousands of yards every day. To suit this market they must be of a certain width, of a certain weight, and so many yards in a piece. Your manufacturers do not appreciate the importance of this; they know more about this trade than I do, and when I send them a sample and an order for so many pieces exactly like it, they send me something different. They haven't got the exact article on hand, but say what they send will answer just as well. It won't answer as well; it cuts to waste and the retail merchants will not buy it. Nine out of every ten orders I have sent to the United States have been answered in this way, and I have given up buying there, and send to Manchester, where I can get precisely what I ask for.

"Then again," continued Mr. Rohl, "the American manufacturer will not pack goods to suit this market. All duties in this country are assessed upon the gross weight of the package, and a large part of the goods are sent into the interior on mule-back. The American manufacturer cannot be made to see the importance of packing goods so that the package is deprived of every ounce of surplus weight, and light enough to be carried on the back of a mule. I do not want to pay heavy duty upon a lot of pine boards made into a packing case, when the goods can be sent in light bales just as well, and I do not care to stand the expense of repacking American goods when I can buy the same thing properly packed in Europe. I suppose much of the difficulty lies in the ignorance of American manufacturers, who have not studied the condition of this market, because the demand at home has hitherto been great enough to keep their mills busy. If they want to sell goods here, they should send agents to Venezuela to investigate and inform them as to what is required, as the European merchants do. We have English and German agents calling upon us very frequently, but I don't remember when there was a drummer here from the United States. If your people want this market, they can control it by complying with the requirements of our people."

The statements of Mr. Rohl have been repeated by almost every merchant the commission has seen, and the same complaints apply to all other classes of merchandise, as well as dry goods.

A MANUFACTURER'S WORKMEN constitute his family. If well fed and considerably treated, they will make him rich. If dealt with in a cold, unfeeling and mercenary manner, the more independent will rebel and leave, while the others will perform their tasks with more or less sullenness, careful to give no extra minute of time of unnecessary stitch of work; and the master's profit in that case can only come from low wages, long hours and the exertions of exacting foremen.

USEFUL INFORMATION.

HOW TO TAKE OFF A HIDE.—The hides of farm slaughtered animals have a poor reputation, because of the careless way in which they are stripped. Calf-skins and sheep-pelts are reduced one-half in value by being cut and gashed and improperly stretched. When a hide is stripped off it should be stretched at once and pegged out to dry, with the flesh side upward. If it is rolled up, thrown into a heap and left to dry in that shape, it is so mean-looking that a buyer will offer only half its real value. A few hints in regard to taking off a hide may be useful. The throat should never be slit crosswise, either in killing or taking off a hide. The skin is slit from the chin down the brisket, in a straight line to the tail. It is then cut around each hoof; the hind legs are slit behind over the gambrel, but the front legs are slit up in front, over the knee. This leaves the skin in good shape for finishing the leather. The heads and legs are first carefully skinned, and all cutting the skin is avoided. The skin is then easily drawn off by taking hold of it firmly and pulling it steadily. It is then spread out evenly on a floor and salted with fine salt. If there is but one it is best to stake it out as soon as the salt has taken, and dry at once in a cool, shaded place. If there are more than one they are laid upon each other and salted quite freely, and afterward they are thoroughly dried. If the skins are to be kept on hand they should be closely watched for moths or grubs.—*American Agriculturist*.

PRESERVATION OF COAL FROM CRUMBLING.—Freshly mined coal is capable of condensing several times its volume of oxygen in its pores. The oxygen absorbed enters into chemical combination with the easily oxidized constituents. According as the absorption is rapid or slow, a greater or less elevation of temperature is produced. In the former it may lead to spontaneous combustion. The crumbling coal is, among other causes, a consequence of the absorption and condensation of oxygen in its pores and the chemical changes taking place. The escape of the hygroscopic moisture favors the absorption of oxygen. The pyrites can only produce a promoting effect on the increase of temperature when present in considerable quantities, and then only in the presence of moisture and air. In the dry state they must be regarded as perfectly passive, and may even be detrimental to the warming. Freshly mined coal, therefore, according to a writer in *Van Nostrand's* magazine, placed in an atmosphere of steam can suffer no change. Even with the incomplete exclusion of air, it will be found that the steam will, in general, oppose oxidation and warming, principally by uniform moistening of the pieces of coal.

MEASURING THE HEIGHT OF TREES OR OTHER OBJECTS.—The height of a tree, a steeple, or other object where a continuous shade can be obtained, is very easily and correctly obtained as follows: Suppose you want to find the height of a tree which throws a shadow of 20 feet. In the first place, I should cut a stick, say 3 feet long, stick it up opposite the required tree, and measure the shadow of it. We will suppose the stick throws a shadow of 2 feet: now all I have to do is just to make a simple proportion sum of it.

Shadow of stick 2 feet	:	Shadow of tree 20 feet	:	Height of stick 3 feet
		3		
		240		
		30		

The height of the tree throwing a shadow of 20 feet would be 30 feet; because as 2 feet is to 3 feet, so is 20 feet to 30 feet. By this method you can measure any tree that the sun shines upon, provided there is nothing to hinder measuring its shadow.

FILES.—Cabinet files—In shape like a cabinet rasp. On flat side it is double cut and grade of "bastard." On the oval side it is the same grade of cut or bastard half-round. Warding file—A file in cut and grade of cut the same as "flat." It is seldom made over eight inches in length. In appearance very much like a flat file—differing in three ways. It is forged more to a point than a "flat," and compared with the same length of "flat" file is not so thick, but has more width. Joint file—In shape a thin "equaling." It is cut on the edge only, and is sometimes made with round and sometimes with square edges, according to the wishes of the buyer. It is known also as a "drill" file. As regards thickness, it can be ordered by numbers, according to Stubbs' metal gauge.—*Amateur Mechanic*.

A MILFORD, MASSACHUSETTS, machinist has a top made by himself that will spin continuously for half an hour. It is made of solid iron about the size of a roller skate wheel and has a hardened steel peg. He spins it on the bottom of a tea-cup, and the balance is perfect. The top can be arranged to illustrate several scientific experiments.

RAILROAD BALLAST OF SALT.—There is a vast bed of rock salt in the Colorado desert, near Idaho, and the Southern Pacific Railroad in laying the track to the salt mine, have been obliged to grade the road for 1200 feet with blocks of beautiful lumps of salt crystals. This is the first

instance of a railroad roadbed being laid and ballasted with salt, of which we have any knowledge. The sea that once rolled over this place dried up and left a vast bed of salt about 50 miles in length. The quality is superb and supply inexhaustible. Grasshoppers of enormous size and giant centipedes have been pickled, and are to-day after the lapse of centuries, in full size and perfection of shape.

SHOP HANDS.—A shop where all hands seemed to regard each other as men would be an interesting place to visit, but we do not expect to find anything of its kind this side of the next world. If a man gets hurt and is laid up for three months, the boys will take right hold and patch up a goodly sum to help him along, but if he cuts off a finger or smashes his thumb they will all take a look at it and go back to work saying "good enough for him, always into something that didn't concern him," "can't mind his business, and had to fool around that saw" or "served the cuss his lesson that time; guess the boss won't run on to my job again." And all bands settle down to making life unpleasant for some other poor chap who would gladly meet half way in good fellowship his comrade toilers, but who gets a sunb after trying it once, soon gets as bad as the rest, and hunts up his neighbors' weak points to vent his own sourness upon.

The "largest steel casting" is still under discussion. S. T. Wellman, superintendent of the Otis Iron and Steel Company, of Cleveland, writes to the *American Machinist*: "I see by your issue of July 18th that the Standard Steel Casting Company, of Thurlow, Pa., have made what they believe is the largest steel casting yet attempted in this country, weighing 27,000 pounds. About a year ago we made for our own use a pair of steel rolls weighing each, when finished, 31,000 pounds. The charge in the furnace for each weighed 42,000 pounds. They turned up as perfectly as any iron roll could be made. Besides the above we have made several steel castings which weighed in the rough from 30,000 to 34,000 pounds."

PEACH WINE.—The flavor of the peach is superior to that of any other fruit in the world. Peach wine has been made from the juice of soft ripe peaches, which, it is said, by means of a certain process of manufacture becomes a wine of the most delicious character and the very choicest flavor. It is further said that no alcoholic liquor of any kind, and no alcohol in any shape is added; neither are any drugs or chemicals added. The process is new, and according to the *Insno Independent*, is the invention of S. A. Denmore of Independence, who has taken out a patent for the same.

TO MAKE SHINGLES DURABLE.—Those who have experience say that the durability of shingles may be doubled by dipping them into gas tar and resin—boiled into a pitch—while the mixture is hot. The top need not be coated. This substance fills all the pores of the wood so perfectly as to make the shingles impervious to water, in fact they are claimed to be next to slate in point of durability as roofing material.

SHAMPOOING LIQUID.—The liquid employed by barbers for shampooing is made as follows: Dissolve one ounce potassium carbonate (salts of tartar) in one quart soft water; sprinkle freely on the head, and rub well till a lather is formed; wash off with clean water.

A TALL SMOKESTACK.—A smokestack for a smelting works at Pueblo, Col., has just been completed, which is ten feet in diameter in the clear, and 319 feet high. The stack is made of iron and lined with fire brick.

SHIP SUPPLIES.—It is estimated that at least \$3,000,000 per annum are expended in San Francisco for ship supplies and by the officers and crews of vessels in their visits ashore.

GOOD HEALTH.

NEURALGIC HEADACHE OF WOMEN.—The increasing frequency of neuralgic headache among women must have a cause. There is one of simplicity which has been overlooked, and one to which it is worth while to draw attention. The pain experienced is generally located in one or more of the branches of the second cervical nerve, very commonly those terminating in the scalp at the back of the head. The nerves of the scalp are irritated by the hair being drawn tightly back and put on the strain, not as a whole, in which case the strain would be spread over a large area of the surface, but by small bundles of hair which are pulled back and held in place by hairpins. Relief is experienced by removing the hairpins, but this has only a temporary and partial effect. The injury done is lasting, if not permanent, in its consequences. The present style of dressing the hair should be discontinued, as it in part accounts for the prevalence of a form of suffering which is both intractable and distressing. If it were the fashion for women to wear the hair short instead of long and tied up, there would be less headache than there is.—*Herald of Health*.

MILL GIRDERS.—In a recent paper on mill architecture in the *Journal of the Franklin Institute*, Mr. John Hexamer gave some excellent hints. Speaking of girders he said: "Girders should be solid. When it is necessary to use

compound girders, they should be tightly bolted together, so as to leave no intervening spaces. In storehouses, etc., where there is but little vibration, girders may be inserted in the wall by placing them either on brackets or a short distance into the wall, with beveled edges, without any further anchoring. In mills where the amount of vibration is great, Woodbury advises to securely bind the beam to the wall by embedding in the masonry a flat cast-iron plate with a transverse fin upon each side near the end, one to secure the plate in the wall and the other in a groove across the under side of the beam, firmly secured by wedges driven in at each side of the fin. The bricks in the wall for about five courses above the beam should be laid dry, and the upper edge of the beam slightly rounded, and an air space should be provided at each side of the beams. Under no consideration should the old-fashioned anchorage of fastening the girder on the outside of the wall with a large anchor plate be used, as when the beams burn through the leverage brought to bear on the wall will overturn it."

PNEUMONIA PARASITIC.—According to Mr. Germain See, pneumonia may be epidemic, and he has endeavored to ascertain whether such attacks are distinct from ordinary pneumonia; such a view is demonstrated to be erroneous, and it is clear that there is no pneumonia due to cold; whether sporadic or epidemic, it is always parasitic in origin. The parasite is in the form of an oval micrococcus; it may be separate, or in short chains of four. Inoculated into animals it produces common pneumonia, such as is seen in man; in many cases the microbe has extended beyond the lungs, and, by invading the neighboring organs, giving rise to pleurisy and pericarditis of the same nature as the pulmonary inflammation.

Pneumonia, then, may be considered as a specific parasitic disease, which may be reproduced in animals, but cannot be brought about by physical or chemical irritations introduced into the lungs. It may be absolutely distinguished from such other forms of acute inflammation as bronchitis or broncho-pneumonia, for in them microphytes play but a secondary role, and the first cause of them is cold. Parasitic pneumonia has a regular and definite course, just like erysipelas; its duration does not extend over nine days; for a week there is fever, which then suddenly dies down.

CURVED SPINES.—The chief cause of this deformity is continuous sitting in school or in many other occupations. We lead unnatural lives, sitting three-quarters of the time, while this is the worst position there is for human beings. The injurious effects are most marked in children who grow so rapidly as to be lax in their bearing and who are phlegmatic and naturally indolent. Professor Billroth proposed as precautions against curvature and as suitable treatment for it, gymnastics, swimming, riding, massage, leaning often, work done while standing and lying down, proper desks and tables, an hour or two of complete physical rest during the middle of the day, limitations of mental work, and protection from physical and mental fatigue.—*Herald of Health*.

CIVILIZATION AND EYESIGHT.—Eyesight is not improved by civilization. For instance, in 1812 shortsightedness was almost unknown; now it is very common. We shall, however, eventually remedy this. The proper use and culture of the eyes will in the end prevail. Injury to the eye results from not knowing how to use and care for it. Parents know about how far their children can walk, bow fast they can run, how high they can jump, but not one in 500 parents know anything about their children's eyes, and how they should be cared for. If they would study this subject more we should have fewer poor eyes.

TOO MUCH BLOOD.—Too much blood is as fatal to brain work as too little. The fullness of the vessels and its pressure on the brain cells prevents their healthy action. The body is a machine, like an engine, and we must constantly feed the fires; but it is more than a machine and has secret laws of its own, which suggest we have other duties to do besides feeding the fires and getting up the steam as high as we can. There is such a thing as bursting the boiler by high pressure, and the brain also.

SIMPLE CURE FOR DYSENTERY.—A correspondent of *St. Louis Medical Journal* writes: In 1830, while practicing in Madison county, Ill., I was induced by the representations of an old lady to make the trial in dysentery and diarrhoea, of tablespoonful doses of pure cider vinegar, with the addition of sufficient salt to be noticeable, and it acted so charmingly that I have never used anything else."

TO KEEP MOSQUITOES AWAY.—The *Angler* vouches for the effectiveness of the following mixture for keeping mosquitoes away: Olive oil, three parts; oil of pennyroyal, two parts; glycerine and ammonia, each one part. To be well shaken before applying to the face and hands. Avoid getting the mixture into the eyes.

HAY FEVER.—It is generally supposed that what is known as "hay fever" is a complaint of quite recent origin. A French scientific journal, however, says it can be traced back as far as the 16th century. It was formerly known to the faculty as *coryza a rosarum odore*.

MINING SUMMARY.

The following is mostly condensed from journals published in the interior, in proximity to the mines mentioned.

CALIFORNIA.

Amador.

THE WHITE MINE.—Amador Dispatch, Sept. 17: Mr. Duncan McKenzie, representing a company of capitalists, has bonded the old George White mine near Jackson Gate, and has already commenced work on it in the way of cleaning out the old shaft and getting it in working order. We understand that in the course of three or four weeks a "donkey" engine will be put up for the purpose of hoisting water and rock. They also contemplate putting up a fine quartz mill some time in the near future, if the prospects hold out as good as anticipated. Messrs. Mello & Costa are still taking out good looking rock from their new silver mine near the Gate. But the work is progressing slowly on account of so much water in the mine. They are anxious to get some capitalist interested in the mine so as to help them put up machinery to go ahead faster, they being confident that it is a good investment.

LOYAL LEAD.—Amador Ledger, Sept. 19: The mill has been idle since the 4th of July for lack of water. In running a tunnel east from the North Gover ground, after getting some distance within the Loyal Lead boundaries, a ledge of ore was struck, which had been penetrated eight feet, without getting through it. It shows free gold. In running a crosscut from the stopes of the old works in an easterly direction, at the depth of 50 feet from the surface, another ledge seven feet thick has been encountered, which also looks of a good paying quality.

MOORE.—A contract was let this week to sink the shaft 200 feet deeper, which will give a total depth of 400 feet. The contract was let at \$10 80 per foot to some Italians, but they threw up the job Wednesday night. Mr. Nevills now intends to prosecute the work by day labor.

MISCELLANEOUS.—Mace's mill was started Monday night on rock from the Modoc mine; there is about 20 tons to be crushed. A new and more powerful air-compressor has been ordered for the big tunnel at Middle Bar. The tunnel has made slow headway of late, owing to the fact that only one drill can be run with the present machinery. The tunnel is heading for the point directly under the upper tunnel where the large chimney of pay ore is now being worked. About 400 feet remains to be tunneled before it is expected to reach this ore body.

THE PLYMOUTH CON. CO. are constructing a ditch from the Pacific mill to the gulch southwest of town. It is believed that the work is intended to carry the tailings from the Pacific into Dry Creek, so as to suppress this cause of annoyance to the Amador and Sacramento canal. A large force are at work on the ditch, and it will probably be finished this week.

Alpine.

GRAVEL.—Alpine Argus, Sept. 19: The Chinamen who have been prospecting the Alpine gravel mine lately, left for Carson this week. They got some very good prospects in the gravel near the surface but could not test it on the bedrock on account of the water. We understand that they intend to rig up a pump over the channel so as to make a more thorough prospect of the mine.

Nevada.

ALPHA MINE.—Grass Valley Union, Sept. 16: Ten tons of quartz from the 200 level of the Alpha mine have been hauled to the Rocky Bar mill as a test of the 650 tons now on the dump at the mine, from which a good result is anticipated. Supr. Springer has shown much energy in pushing work since he has taken charge of the mine, and being backed by ample means will place it in good condition for the extracting of ore as fast as the work can be accomplished.

HORSESHOE MINE.—Grass Valley Union, Sept. 20: The new improvements at the Horseshoe mine, are going ahead briskly. The ditch to convey water to the mine has been put in order, the foundations for the frame-work of the new wheel have been laid, and other work is in progress. A wagon road leading down to the mine has also been constructed. It is expected that the new water-wheel and pumping gear will all be in place in four weeks, when the underground work in the mine will be at once resumed.

Placer.

GOLD RUN ITEMS.—Argus, Sept. 17: The Everhart boys have a mine situated near Secret Town, two miles west of Gold Run, which bids fair to become a valuable possession. They first began working it May 10, 1884, and have worked it at intervals since then. It is a quartz lead, the ledge being 16 inches in width at present, the top and bottom are well-defined walls, the western one being of porphyry, the other of black slate. The ledge is reached by an incline extending 34 feet into the side of a hill, which makes the perpendicular depth from the surface to the bottom of the incline 75 feet. The men are now working ten feet below the water line. About a fortnight ago 10 pounds of the rock yielded \$15. Some of the rock is expected to go \$2500 to the ton. They have 15 tons of it ready for crushing. It is the intention to have it crushed, if possible, at the Rising Sun mill, near Colfax, but if it cannot be crushed there they will send the quartz to Grass Valley. The owners of this property are C. M., J. E., Thomas and Mrs. H. B. Everhart, W. K. White and J. Y. Thomas are working a gang of Chinamen on the riverbed in the North Fork of the American, near the mouth of Canyon creek, and they are doing first rate. One week lately they took out \$400. They have been operating there about five weeks.

QUARTZ MINING.—Placer Herald, Sept. 19: We mentioned last week that extensive arrangements were being made for working the Boulder ledge; that the Morning Star was adding five stamps to the capacity of its mill; that work had been started again on the old St. Patrick; that they are getting things in order for resuming work on the Green mine, and that the Gold Blossom was turning out some good ore. In addition to these items, all of which tend to show a material awakening in the quartz mining interests in this part of the county, we learn that Mr. W. J. Lawrence has completed arrangements for the erection of a new mill on his ledge a short distance below Newcastle; that Mr. Dan Kennicott is developing an extension of the

Julian mine in the same neighborhood, and that the Schnabel brothers have recently returned from Arizona and are preparing to start the Julian again. Within the last few months there seems to have been a decided impetus given to the matter of quartz mining in this district. That there should be is not surprising. There is plenty of capital in this country and it is seeking investment, and by economical and judicious management this section offers more favorable inducements than many places more remote that are attracting great interest. If Steve Quinn had taken the money from a mine in Arizona that he recently realized from his ledge near Bellevue Hill, a report of the fact would have caused a regular boom and induced the investment of much capital in that far-off Indian ridden country, while here, close to home, the strike created hardly a ripple of excitement. And if some man in Cœur d'Alene should find a \$250 nugget of pure gold, as was found in Doty's Ravine a week or two ago, the country would have gone wild; while here the occurrence simply suggested the thought, that there are a few more left, if you only knew where to find them.

Plumas.

BUCKEYE MINE.—Plumas National, Sept. 19: Mr. Poe, of Mohawk, informs us that he has struck a body of ore eight feet wide in the Buckeye ledge, at a depth of 55 feet, that prospects very favorably. Messrs. Chamberlain & Flint, of Reno, are partners of Mr. Poe, and they propose to prospect the mine thoroughly with a view of putting up a mill this fall or early next spring.

GRANITE BASIN.—Mr. Johnson, of San Francisco, informs us that he will put machinery on the Siebert and Homestake mine in Granite Basin this fall. The ore in this mine assays well, but has never been successfully worked on account of base metal. Mr. Johnson is confident that he has a process by which it can be made to pay.

Shasta.

QUARTZ.—Shasta Democrat, Sept. 16: Ed. Hume and Silas Stickley last week struck a very promising gold quartz prospect near Buckeye. Much of the surface ore is worth \$40 a ton. Ollie Whitton came down from his Squaw creek mine yesterday and brought with him 22 ounces of gold amalgam, the result of a few days' run with a horse arastra. The prospectors who are rooting around in old abandoned prospect holes that were deserted in early days as worthless, are now uncovering some excellent gold and silver ores. Yesterday morning Willard & Weil bought about \$400 worth of gold dust mined at Copper City. This shows there is money in the ground in that camp outside of the base quartz. It was reported in town Monday that Robinson had disposed of his interest in the Salt creek tellurium mine. His interest consists of a written contract requiring him to erect on the mine machinery to work the ore with, in return for which he is to receive one-fourth of the net proceeds. About 15 quartz claims have been located between the Middle creek and Shasta and Spring creek roads since Porter and Alexander located the Shasta Prince on the 9th inst. We are told that the quartz is of a bluish cast, fine grained, and some of it assays as high as \$500 to the ton. Yesterday we learned that ex-Governor Perkins was interested with Mr. Mathew in the purchase of quartz mines at Lower Springs, and that the Governor is expected up this week. We are also told that it is the intention of this company to erect a mill at Lower Springs this fall. Senator Foster, of Red Bluff, is endeavoring to form a company to build a large custom quartz mill in the Bullychoop district. Developments in that district within the past year have demonstrated that a good-sized custom mill would pay big money on the investment. Last Sunday, in company with Hon. Reuben Clark we visited his mine at Quartz Hill. We found since our last visit that great improvements had been made. All the machinery is in place, consisting of ten Hammond stamps, rock-breaker and self feeders, two Frue concentrators, engine, pump, etc., and a 10,000-gallon water-tank that supplies the whole works with water. Several tons of rock had been crushed just to try the machinery, which was found to work nicely. Last week Dan O'Neal struck another rich chute of ore on the first extension, south of the Florida. We have seen some of the ore and it is about as rich in free gold as any we have seen in the county. All the miners and "old residents" say they have never known water in the mountains to be so low and scarce as it has been this fall. Many mountain springs which always afforded plenty of water are now almost dry; even there is now less water in the Sacramento than was ever known to the "oldest inhabitant."

FROM WHISKYTOWN.—Work on the Mad Mule mine, superintended by F. M. Stocking, is progressing nicely and prospects look favorable for a big find. J. S. Strode has resumed work on the old Pinetop mine and will no doubt develop a fine property. Repairs are being made on the old Phoenix dam, and I understand that a five-stamp mill will be erected here in the course of a few weeks for the purpose of crushing rock from the Phoenix mine.

GOOD ROCK.—Shasta Courier, Sept. 16: McConnell and Morland, of Shasta, have purchased Jack Strode's quartz ledge on Kanaki gulch west of town and are finding rich rock. We understand that W. T. Coleman has recently made additional purchases of mining property in this county.

IRON MT.—The negotiations for the sale of Iron Mountain were said to have been closed this week. Camden, Magee and Salee went down to San Francisco Monday to put the finishing touches on the sale. We know nothing definite as to the price actually paid, but from the time spent in negotiations and amount of figuring by the parties concerned, we should suppose that not less than half a million was at stake.

Sierra.

PROSPECTORS AT WORK.—Sierra Tribune, Sept. 11: Judging by the number of prospectors at work out in the hills, we should not be surprised to hear of some valuable strikes being made before winter storms set in. Tuesday the first clean-up of the Young America mill was made, after a 17 days' run with 10 stamps. The result of that clean-up was \$16,000 in gold bullion, which was brought to town in the afternoon by Manager A. C. Busch. The gold was molded into two handsome bars, the workmanship of which reflected much credit upon Philip Deidesheimer, Jr., who has charge of the assaying department at the mine. The first run has proven

conclusively that the excellence of the mine has not been over estimated even by the most sanguine. Sam Thompson is driving ahead work on the new 10 stamps, and if all goes well they will start up in four or five weeks. There is enough ore on the dump at present to keep the mill going five months without taking a pound more from the mine.

GREENHORN MINE.—The well known Greenhorn mine, on Greenhorn creek, owned by a Grass Valley company has been bonded to T. W. Hughstone, of Oakland, who has associated with himself other Oakland parties and residents of this place to work the mine. The mode of operation will be to extend the tunnel on the ledge and obtain a large extent of backs, which the lay of the ground permits. The vein is quite large, and although of low grade can be mined and milled so cheaply that rock yielding \$7 per ton will give a handsome profit. In due time the new company will put up a mill in order to avoid the cost of hauling the rock to the custom mills of the district. The bond upon the mine is for 18 months, and 10 per cent of the gross proceeds is to be paid by the lessees, which amount will go toward paying for the bonded price of the mine in the event of the property being finally accepted. Work is to be commenced immediately, and Stephen Fowler, a well known miner of this district will be foreman. The mine is well thought of here, and with the proper development it is confidently believed that it will become a good paying property.

BALD MT. EXTENSION.—Mountain Messenger, Sept. 19: Owing to the wearing out of the pumps now in the extension shaft, a new and larger pump has been purchased. The pump and rigging are now at Columbia Hill, Nevada county, where it was used in sinking a deep shaft on a gravel channel. Next Monday teams will start from San Juan for Columbia Hill to load the material, which will be landed at the shaft by the last of the week at least. The pump is a 10-inch cylinder, single-acting plunger, Cornish pump, with a stroke of six feet, which when run at a piston speed of 72 feet per minute will raise 26 inches of water. Probably a speed of 54 feet per minute will be all that will be required to raise sufficient water for the use of the mine. An experienced pump man has been employed to put the pump in place in the shaft. Bald Mountain Extension Co., Forrest City, cleaned up last Sunday 165 ounces. The gravel is somewhat hard now, and has to be blasted. An eight-ounce nugget was found sticking out of the gravel on the dump.

ABOUT THE YOUNG AMERICA MINE.—Sierra Tribune, Sept. 19: Last Friday the vein was struck in the lower tunnel at the Young America mine. At the point where it was tapped (in the crosscut 15 feet from the main adit) the ledge measures 3½ feet strong and is just as rich in free gold as any place in the upper workings. The lower tunnel is in the hill between 600 and 700 feet and the distance from there to the upper tunnel, in a perpendicular line, is about 200 feet. We firmly believe that the Young America stands to-day as one of the greatest gold mines ever uncovered in the State. We also believe that ere another season rolls around Sierra City will take its place as being the center of the best quartz mining region on the coast.

Siskiyou.

ORO FINO.—Cor. Yreka Union, Sept. 17: The quartz mines are beginning to look up again. Carson & Co. are beginning to stope out the ore from the Italian Pete ledge and will take out 200 or 300 tons by the time water comes. The ledge is from one to three feet thick and prospects well all through. Connor & Co. have got their ledge well opened and are getting big prospects, as high as \$50 to the ton. The ledge ranges from six to fifteen inches thick and bids fair to be one of the best in the camp. There are several more ledges being prospected that show equally as good prospects as those above mentioned but are of smaller dimensions. The Weeks & Williams claim, on Indian creek, was sold to a company of Chinese about the 25th ult. for \$26,000—\$8000 down and remainder taken as it comes out, over and above the natural expenses of the claim. Mr. Williams runs the top of the claim and receives the money, while the Chinese run the bottom until the debt is paid.

San Bernardino.

CALICO MINES.—Print, Sept. 20: At the Blackfoot a few men have been discharged, as the supply of ore has somewhat decreased, but prospecting is being pushed forward with sufficient evidence that another rich body of ore may be opened. The company believes in progressing cautiously and avoiding any unnecessary expense. The company operating the Blackfoot recently purchased the "Lion" mine from John McBride & Co., and under the foremanship of Dennis Flynn, employ some eight or ten men in developing the mine. There appears to be an abundance of good milling ore in sight and easy of extraction. Childs & Co., owners of the Mary Bell, east of the Blackfoot, are working the same with encouraging results. John Benefield is working on the west end of this mine with the same results. Owing to the absence of John McBride, work on the Plutarch was for awhile suspended, but now work on the same is resumed with the usual energy of the owners. At the Odessa everything is moving along in first-class order. Probably no other mine on the coast is to-day producing as much bullion with the same number of stamps. The Odessa mill is under the management of E. J. Murray, who is likewise paymaster of the company as well as general financial agent and bookkeeper. At the Garfield, under the management of J. L. Patterson, superintendent of J. S. Doe & Co.'s mining operations, work is carried on in a systematic order. The King is preparing to erect hoisting works. No diminution of the ore bodies is reported. On an average of 40 to 50 tons of ore are daily taken to the company's mill from this mine. The Josephine, about a half mile north of the King, owned by Lawrence & Co., a tunnel is being driven in by Al. White, with good prospects. This tunnel has cut through several seams of ore, but the principal object is to reach the main ledge or ore chimney.

PROVIDENCE MINES.—Calico Print, Sept. 20: Since the burning of the mill in August of the Bonanza King Con. M. & M. Co., almost a complete shut-down has taken place. The insurance on the property has been adjusted and paid, and the president, Wilson Waddingham, has gone East to New York to see what his company is going to do. A new mill without doubt will be erected during the winter, perhaps of greater capacity than the last. The debris of the old mill is being cleared up, when everything will be shut down to await the action of

the company. The mine has never had more ore in sight than at present and especially at the lower levels, 7th and 8th. It is not necessary for the company to prospect as they could keep a mill running providing they had a mill erected, but the ways of companies invariably take their own time and way of doing things.

The Mozart group of mines are being prospected by 8 or 10 men. A main shaft is now down 75 feet; they are crosscutting to cut the ledge which with the dip of the mountain would give them 180 feet of a stope; the ore body on top is large and well defined. Another of the group Mineral Point is having a tunnel run on the left which shows a body of high grade ore.

The Belle McGillroy mine is being steadily worked by the owners. They now have on the dumps, some 30 tons of first-class ore and about 200 tons of lower grade. This mine now shows a continuous body of ore for 125 feet in depth, at least 1000 ton of medium grade ore in sight and in any other camp it would be called a good high grade.

The Kerr and Patton property has been bonded to some Los Angeles parties with a forfeit of \$1000 a month. They have expended some money in development for the past few months, showing that the mine improves with work, but as is the case in so many bonds, the bonder wants his pile at once, and matters now stand in statu quo for the present.

Tuolumne.

LOCAL NOTES.—Union Democrat, Sept. 19: We hear that some very rich rock is being taken from the Seminole mine at Summersville. A vein eight feet thick of fine milling ore is being drifted on the 600-foot level of the Buchanan mine. Work in the Dead Horse mine is at present confined to sinking. The shaft is now down below the 400-foot level, but it will be sunk to a still greater depth before a station is opened. Adam McKenzie, William Martin & Co. are working a bar at the old Central Ferry on the Stanislaus river, seven miles below Reynolds' Ferry. They have just finished their dams and got their derricks and pumps rigged ready for washing. We understand that there is a movement on foot in this county to reduce the rate of miners' wages. Miners now receive \$3 per day, but it is proposed to cut this down to \$2 50. So far none of the mining companies have made any move toward the reduction. Nervi's mine, about seven miles above Columbia, has developed into a fine property. An extensive chute of high grade ore has been exposed in the mine, and each new development makes the prospect brighter. A five-stamp mill is kept busy crushing the ore, which pays handsomely worked free. The new pump has cleared the main shaft of the Lampher of water, and work has been resumed in the south drift on the 500-foot level. There has lately been considerable improvement in the quality of the ore stoped from the South shaft. The rock being hoisted at present mills from \$20 to \$25 per ton. We learn that there has been an important strike made in the Pennsylvania mine at Soulsville, in which Mr. Leechman has a force of four men prospecting. In the South drift a fine vein of heavy sulphureted ore, about 18 inches wide, has been encountered. The ore goes high in free gold, and the chute promises to develop into a large ore body.

Yuba.

QUARTZ MINING.—Grass Valley Union: Quartz mining is looking up in the foothills of Yuba county. The Rising Sun mine of Brown's Valley, is yielding at the rate of \$45 per ton, and at Rose's Bar, between Timbuctoo and Sucker Flat, prospecting is being done with encouraging results, and a number of new locations have been made.

NEVADA.

Washoe District.

HALE AND NORCROSS.—Enterprise, Sept. 19: The main south level drift from the deep winze has been extended to the distance of 72 feet from the winze, and is being pushed ahead energetically, skirting along the east side of the ore vein. It cuts through occasional projections and offshoots from the vein, which give high assays, indicating what may be expected when crosscutting shall be done westward into the vein. The main west drift or crosscut from the winze, same level is now out 42 feet, and is all in quartz of a very strongly mineralized nature, streaks and bunches of which give high assays, and good promise of something more concentratedly better ahead. No water is encountered in this direction as yet, and none is particularly feared, as the work is carefully conducted, and at the first sign of tapping water the work will be suspended until connection with the big pump of the Combination shaft is effected.

CHOLLAR.—The main west drift from the 3100 level of the Combination shaft during the past week, after reaching a point about 145 feet from the shaft, got into the main ore ledge and a few good assays were obtained from the face. Further advance in that direction was abandoned, and a branch or turn was made to the northward which is now out from the drift 42 feet, following the east side of the ledge toward a connection with the lateral drift coming from the Hale and Norcross. This main west drift from the 3100 level of the Combination shaft terminates in Chollar ground 60 feet south of the Hale and Norcross south line; therefore, after the connection aforesaid has been made, supplying plenty of good air, the drift is to be continued through to the west wall two or three hundred feet distant. A south lateral drift will also be made to develop the merits of the Chollar at that depth. The pressure pipe for the new half section of the big hydraulic pump in the Combination shaft is now on its way from San Francisco, and will probably arrive to-day. This will be put into practical operating position forthwith, taking about a week, after which the capacity of the famous pump will be doubled and crosscuts can be pushed west or in any other direction without fear of striking more water than the pump can handle.

BULLION.—The parties who are prospecting the upper portion of this mine, running a drift west from the 160 level of the old Fairview shaft, have suspended operations for the present. They did a large amount of faithful work under their lease from the company, but were disappointed in not finding any ore which would pay to extract and mill. After seven long months of hard work they are taking a rest.

CON. CALIFORNIA AND VIRGINIA.—The 1750 level continues yielding about 125 tons per day of

low grade ore, assaying \$14 per ton, extracted on company account. Only a few tons of ore from select points in the old workings above the 1550 level, under the Jones lease, are now being daily extracted, giving about \$18 average assay. On the 1400 and 1200 levels considerable exploration and opening up work is being done in preparation for the time when milling can be resumed, and ore extracted on a stronger scale than ever. The Eureka mill, which has been running on ore from the Jones ground, is now shut down for repairs.

CROWN POINT.—Some little prospecting work is being done in this mine and in the Belcher, but lack of milling facilities will not allow of extensive ore extraction just yet. The machinery has all been put in the most complete working order, ready for a long run. The Mexican mill is now in a full and complete state of repairs, ready for practical work with a good supply of water as a motive power. It can run only one-third of its stamps at present.

SIERRA NEVADA.—On the 520 level the crosscut west from the north lateral drift, 1000 feet from the shaft, has been extended 52 feet during the past week. The material in the face is softer porphyry and vein matter, containing some little quartz, being the first yet encountered worthy of mention.

BEST AND BRICHER.—On the 1900 level west crosscut No. 2 has been extended 22 feet during the week, making a total length of 207 feet. The material in the face shows no change, being still hard, dry porphyry, with a few seams of clay and quartz.

OPHIR.—Drifting westward for the 350 level of the old Mexican shaft is making good progress, and is about cutting into the old Ophir ledge and workings of several years ago. Good ore is expected to be met with at that point, which would not pay under former cost of extraction and milling.

GOULD AND CURRY.—On the 1000 level west crosscut No. 1 has been extended 48 feet during the week, making a total length of 380 feet. The material in the face is softer than heretofore met with and of a generally more favorable nature.

YELLOW JACKET.—Between 160 and 170 tons of ore is the daily yield from the old workings on and above the 7300 level. The Brunswick mill is running up to its full capacity and is given all the bullion material it can get away with.

ANDES.—Work still progresses westward on the 175 and 275 levels, the first being a good looking vein matter, and the second in quartz of a very promising character giving low assays.

MEXICAN.—The middle crosscut on the 500 level is now out about 170 feet, running at present in heavy, wet ground, which, however, is found more dry as the drift advances.

JUSTICE.—The north end of the mine continues its regular daily yield of about 25 tons taken out through the old Woodville shaft.

KENTUCK.—The regular daily yield of 30 tons continues to be hauled to the Rock Point mill on Carson river for reduction.

UNION CONSOLIDATED.—The north drift is being continued into the Sierra Nevada ground, and it is now proposed to crosscut west.

Como District.

NORTH RAPIDAN.—Virginia *Enterprise*, Sept. 12: The 30 tons heretofore mentioned in the *Enterprise* as being hauled from the North Rapidan mine, near Como, last week to the Rocky Point mill, on the Carson river, below Dayton, has been milled with very gratifying result, yielding \$34.35 per ton. Foreman Shirley, of the mill, thinks that he might have done better than that if he had been more familiar with the rock. The North Rapidan is owned by Senator Westerfield, District Attorney Keith and other solid men of Dayton. Work will be prosecuted at the mine more vigorously than ever now that it is ascertained to be a paying institution. Three hundred feet of 12-inch air pipe was sent up yesterday. The mine is opened by an incline, which extends to the 150 level, at which point the ledge is 40 or 50 feet wide, more or less; in fact, its real width has not been ascertained. It runs nearly north and south, with a dip to the east of about 45 degrees. The hoisting is done by means of horse-power, the rope passing over a gallows frame and under a wheel at the ground, this apparatus being known in the old country as a "whisper derry." The North Rapidan was formerly known as Orizaba, No. 2, and is situated on the Palmyra side of the Como ridge or divide. Surveyor Gignoux went up yesterday to define the boundary of the claim, which is 1500 feet in length; also, to survey some other claims adjoining.

VIENNA.—Wood River *Times*, Sept. 9: The Vienna mine is working a large force of men—about 60—and the mill will start up, it is expected, tomorrow. The ore-house is full to overflowing, with plenty more ore in sight, and once the mill starts up it will continue to run all winter. This is no idle rumor, as the information was furnished the *Times* correspondent from the office of the company. The Vienna company, by the way, has struck a rich and extensive body of ore at the bottom of the shaft—the lowest depth attained. This is what Mr. Johanson, the superintendent, has been working for the past few years, and now he feels satisfied that his is a mine in reality, and the lower it is exploited the better it will prove, as the ore increases in richness as well as in quantity. The Lion mine is being worked by a small force of men, who are taking out considerable ore. The camp seems dull to the old resident, but in reality it is better to-day than any other camp in the country. In all, there are probably about eighty men at work for wages, while a great many are doing the assessment work on their prospects.

Eureka District.

ORE SHIPMENTS.—*Sentinel*, Sept. 19: The small mines of the district have yielded well the past week. Among the ore shipments to the reduction works in town reported to us are the following: To the Richmond—Hamburg mine, 43 tons; King Lear, 48; Continental, 1½; El Dorado, 4½; Home Ticket, 10; Lord Byron, 27; Lone Pine, 7; Prospect Mountain Tunnel, 5; California, 4; Silver Lick, 25; Williams, 8; Silver Connor, 17; and White Pine, 2. To the Eureka Con. works the Phoenix shipped 35 tons, and 15 tons of high grade ore was brought in from the Reville district.

MINERAL HILL.—From parties just in from Mineral Hill the *Sentinel* learns that a prosperous season is being enjoyed there. Barker, Spencer & Co.'s mill has ceased working tailings and is now busily

employed on ore of a good grade; that the company's mines are producing. Notwithstanding the tailings washed away by the recent flood there enough remains to keep the mill employed for two years to come. Altogether the situation at Mineral Hill is good, to say nothing of the promising outlook in the way of further ore productions that it has.

ORE SHIPMENTS.—Eureka *Sentinel*, September 19: Ore shipments to the two reduction works in town during the past week have been unusually good. To the Richmond works the Silver Connor shipped 33 tons, California, 16; Hamburg, 92; Eureka Tunnel, 2; White Pine, 3; and Bowman 23. The following named mines made shipments to the Eureka Con. furnace: The Union mine of Silverado, the Paul of White Pine Mountain, the Delphi, Jefferson, Enterprise and Bald Eagle. To the same works there was also shipped Alexandria, 8½ tons; Hawkeye, 7; and Lizzie L., 8.

Mineral Park District.

PROSPECTING.—Virginia *Enterprise*, Sept. 20: Several prospectors came in from Mineral Park district yesterday to procure supplies for winter, and see old friends, after an absence of some months, during which time they have developed their claims to such an extent that they feel warranted in working all winter. They show some good rock, and, of course, tell some good stories about their prospects. The veins in that district are large, carrying much pure gold in small stringers that promise to lead to something valuable. Twenty years ago Mineral Park was the objective point of a large number of prospectors, and considerable money was spent there by Constockers, who at that time were ready and willing to spend their cash in almost any locality that showed even a fair prospect.

Pennsylvania District.

PROSPECTING FOR WATER.—Pioche *Record*, Sept. 14: On Thursday G. R. Barton left with a 10-horse team loaded with supplies for Pennsylvania district. The district will be thoroughly prospected for water, and a 10-stamp mill will be erected at that point where sufficient water can be found nearest the mine. The quality and quantity of the ore have been satisfactorily demonstrated. A. McDougall has disposed of his interest in the district to Mr. Barton.

Reese River District.

WHAT IS GOING ON.—The following latest report from Superintendent Curtis, of the Manhattan Mining Company, at Austin, gives an idea of the mining operations of that locality: At the Lander shaft the breasts below the 700 continue to produce excellent ore, though in limited quantities. The 700 east drift carries a very small ledge, and a crosscut has been started into the hanging wall to prospect the hanging wall ledge. The winze being sunk below the 740 carries a large ledge of average ore. At the Paxton incline the tributaries in the several drifts continue to extract the usual amount of ore, though not of high grade as formerly. The 1440 and 1500 west drift are being advanced by tributaries and show no change worthy of note. At the Isabella incline the drift running west on the Currie ledge has been stopped for the present and stoping commenced on the ore already run through. Connection has been made between the 870 west drift of the Paxton and 500 north crosscut of Isabella, which affords a better outlet to the waste. At the Union shaft the two drifts east and west of the Union ledge are continued, but show little ore. The north crosscut is continued, but has not as yet cut any other ledge.

COLORADO.

PLACERS.—Denver *Tribune-Republican*, Sept. 19: Confidence in the gold resources of Colorado is daily increasing, and in a few years our product of gold will equal that of silver. This will come from placers fully as much as from lode properties. The magnificent success achieved by the Sovereign Company in Park county will strengthen the faith and nerve the hands of capital to engage in like undertakings. The sneers of old-timers can no longer deter men from vigorously working placer ground which those old fossils declared they had carefully tested and found too poor to pay. The marvelously rich banks extending on both sides of the Platte river from Alma to Montgomery stand as monuments to the shiftless methods and unskillful work of Colorado's pioneer placer mines. Ground of such even richness cannot be duplicated in any State outside of this, and hence it is remarkable that some old pan pretender did not stumble upon a knowledge of its great value. The ground is "lousy" with gold, as any one can verify, and it follows as a matter of course that these fellows who asserted that it would not pay to work were either bungling panners or else lied about panning it. It's not stretching the truth to say that the head of the Platte river will, in a few years, have a reputation for the production of placer gold unsurpassed by any of the famed gulches of past years. Placer mining, instead of being played out, is simply beginning in Colorado, and hence the statement that our gold product promises to equal or surpass that of silver. We have hundreds of thousands of acres of rich placer land that has been allowed to remain untouched for years simply because old-timers said it was not good, and people believed that they knew what they were talking about. California has produced more gold from her placer deposits than from her gold lodes, and Colorado can for a time repeat this history.

NOTES.—Boulder *News and Courier*, Sept. 19: The December mine, near Jamestown, is turning out some very rich ore just at the present time. Dr. Earhart and Col. Teters have a very fair prospect in a new gold find near the Emancipation, at Sunshine. The surface rock shows rusty gold very freely. Shaeffer & Co. made a shipment of 4,304 pounds of ore from the Smuggler lode last week, the different grades running all the way from five ounces to 508 ounces gold per ton. The shipment was the labor of three men 20 days, and brought \$816.11 at the smelter. The following shipments of ore from the Smuggler mine were made recently by Ingram and Duffie: 1645 pounds, \$163.44; 2470 pounds, \$246.99; 3388 pounds, \$270.14; 2067 pounds, \$271.89; 2502 pounds, \$1182.09. This is the labor of a small force of men for just one month, and aggregates 13,132 pounds of ore, yielding \$2137.53. A mill run of ore from the Romance lode in Central gulch, near Jamestown, gives the following favorable results: First-class, \$340.69 per ton; second class, \$75, and the surface mineral run \$101.05. The Romance is worked under lease by Messrs. Tomlinson and Burhams, who have spent the greater part

of the season in developing and getting the mine in proper shape.

IDAHO.

BLACKBURN DISTRICT.—Cor. Wood River *Times*. In your issue of the 27th ultimo it appears that you considered that the Blackburn Mining District had been changed to the "Oriental Mining District." I beg to state that there has been no change, but the facts are as follows: We have two mining districts in this portion of Alturas county—the Blackburn district, between Little Lost river and Birch creek, and the Ontario district, between Birch creek and Medicine Lodge creek. The Oriental district is situated in the extreme eastern portion of Alturas county. The first mines found in each district were discovered by Charles F. Blackburn. Mr. Blackburn and his friends were the organizers of these districts. There are some very promising mines in each district.

MULDON IMPROVING.—Colonel Bullentine came in from Muldoon yesterday, and went on up to Ketchum to-day. He reports about 50 men at work in and around Muldoon, and times there improving slowly. Sam Wilson has struck a six-inch vein of ore in the Black Spruce claim, from which he gets assays ranging from 2800 to 3100 ounces. Colonel Havens, who landed some claims near Muldoon for \$20,000 a short time ago, has quite a force at work upon them, and the claims are opening out satisfactorily. Several shipments of ore and bullion have already been sent out from Muldoon this summer via Tikura, which is the shipping point for that region, and more will follow from this time on until snow flies.

FROM ANTELOPE.—J. F. Kunkle and A. J. Becker came in to-day from the Dry Fork of Antelope, a district situated about eight miles west of the Horn Silver mine. Although the district was only discovered last May, there are several paying claims already, such as the Ajax, Gerie, Vance, Noonday, Mono, Belle of Camden, New York Boy, Henrietta, etc. Several shipments from these and other claims are on the way here to Houston. All ore assaying 100 ounces or over is shipped to Halley, and all ore assaying less is shipped to Houston. The ore is free milling and all high grade; assays go from \$2000 to \$25,000 per ton. Three tons of Ajax ore on the way here is expected to yield \$5000 per ton. Mr. Kunkle says that this is a poor man's district, as the mines pay from the grass roots.

THE GOLD BELT.—Superintendent Doniphan, of the Camas No. 2 Mining and Milling Company, came to town yesterday to bring in the bullion resulting from the last clean-up of his mill. He reports the supply of water somewhat increased lately, and expects no further trouble from lack of water until next summer; and even then thinks that the flow from the mine will be ample to run not only 10 stamps, but the 10 additional ones now being manufactured for him in the East. The mill began running about June 1st, and run about six weeks. During that brief run it turned out about \$5000 worth of fine bullion. This comparatively satisfactory result, coupled with the developments in the mine in the meantime, demonstrated that with 20 stamps and an adequate supply of water, the mill would prove a paying investment. An additional number of stamps was therefore ordered, and as soon as they reach here they will be put in place and the mill started up for an all-winter run. The cost of running and milling this summer has averaged \$4 per ton; but Mr. Doniphan is confident that with 20 stamps, he can reduce this to \$2.50 per ton. The mine is opening up splendidly and the lode shows three distinct and separate strata or veins. Close to the footwall a strip from 10 to 16 feet thick yields the richest gold and silver ore. A horse comes next; then the middle vein, which is 30 to 35 feet thick, the ore being somewhat lower grade, carrying pyrites and some bunches of high grade galena. On the footwall is a smaller vein of red and white quartz, carrying ore not quite as rich as that found on the hanging wall. This formation continues in depth, and is shown by a tunnel driven 75 feet below the surface outcroppings, and about 50 feet below the former lowest workings of the mine.

MONTANA.

TEN MILE MINES.—Helena *Independent*, Sept. 17: Not many weeks ago John Caplice left for New York for the purpose of organizing a company to develop the leads on Ten Mile, particularly those embraced in what is known as the Lee Mountain group of mines, and in a short time succeeded in organizing a company of capitalists to commence a systematic development of a large number of mines on Ten Mile. These mines embrace what is known as the Lee Mountain and Latham groups, the former containing seven leads and the latter six, making 13 in all. Besides these the company has secured the mill sites and water rights recently belonging to the Capital Milling Company. The company was incorporated under the laws of New York, and is known as the Consolidated Ten Mile Mining and Reduction Company. Mr. Caplice, besides being president, is manager in charge, and is authorized by the directors to commence developments at once by sinking shafts and running tunnels, the object being to develop a sufficient quantity of ore to justify the erection of machinery for its reduction. Men have already been set at cleaning out the old tunnels and shafts and work is fairly started on the Lee Mountain, Micawber, Stanton and one or two other mines. The design of the company is, first, to have plenty of ore in sight; second, railroad facilities; third, machinery. This is certainly an improvement on the happy-go-lucky plan that has heretofore characterized mining enterprises on Ten Mile.

THE DRUM LUMMON.—*Inter-Mountain*, Sept. 14: Henry Bratrobe, the popular assistant manager of the Drum Lummom arrived in the city Sunday night, and will remain several days. He says the company is making extensive improvements at the mine, and among other things has expended some \$30,000 in the past few weeks in covering their water supply to protect it from the winter's freezing. The bullion output now runs from \$75,000 to \$95,000 per month.

WORK.—Butte *Miner*, September 17: There is considerable work being done in the mines of this district outside of the large mining companies. The small mine owners, the lessees and tributaries are accomplishing a great deal in the work of opening up the wonderful mineral resources of this country. We are glad to see that there is a disposition on the part of the large mine owners and managers of this district to assist and encourage those who wish to take

hold and prosecute work on the small mining claims, and those places in large mines that have been abandoned by the management on account of the ore being so scarce, or of such a low grade that it will not pay for the company to extract. In many cases, miners are given a reasonable percentage to work those places, and very often, as a result of their hard work, (be it remembered that miners will do better work when on a lease, than they will when working on day's pay) ore bodies of considerable dimensions have been encountered, important developments have been made, and in many a mine is working to-day and adding to the mineral output of the country and to the wealth of its owners which would, but for the lessee, be lying idle and accounted of no value. There are a large number of these men at work in the mines of Butte city and surrounding country, and it is of almost daily occurrence that we hear of some small mill owner or lessee striking it rich in his claim or in the ground allotted to him. We have yet to hear of a case in this camp where a party of men have opened up a good mine under the above conditions, that it has been taken away from them by the owners, until they have been given a chance to make a stake out of the property so developed. This is as it should be, and will tend to encourage our miners to go out and open up mining ground that may be thought comparatively worthless.

OREGON.

NOTES.—Jacksonville *Times*, Sept. 19: Miners are again getting ready for winter. Prospecting continues at a lively rate in the Evans creek district. M. W. Knapp has returned from a prospecting tour into Siskiyou county. W. Eldridge, a San Francisco mining expert, went down to Gilice creek a few days since. The Sterling Mining Co.'s reservoir is well along and will be completed before many weeks. J. S. Brown left this place yesterday for Josephine county, where he will take charge of one of Wm. Bybee's mines. A company, of which Tim Dugan and Jas. Herley are members, have found excellent quartz prospects on Jackson creek. Neitz Bros., who are prospecting in the Gilice creek district, returned a few days ago and bring favorable reports from that camp. A great deal of prospecting is still being done in Jackson and Josephine counties and several promising ledges have been discovered. Marshal Curtis and others have purchased the Excelsior quartz ledge on Jackson creek, which was worked to good advantage in early days. It is reasonably certain that a quartz mill will be in operation in this vicinity before the end of the year. Such an enterprise would not only be remunerative, but of incalculable benefit to our county. Bragdon & Walsh of Ashland, who are prospecting quartz ledges on Wagner creek, are well pleased with the present developments. They have received returns from ore sent to Portland for assay, which leave no doubt in their minds but what their mines can be made remunerative with the proper apparatus. There is considerable ore of a good quality already in sight.

MORE DISCOVERIES.—Eedrock *Democrat*, Sept. 17: Mr. Strickland, who has thoroughly investigated the new camp, gives us the following cheering items: Several rich and well defined ledges have been discovered on the Red Mountain about three miles due north of Cornucopia, and 1½ miles from the Red Boy and Mountain Chief. They are on the north side of the west fork of Pine creek, close to the head waters of the Innaha. There are three distinct ledges, and from 15 to 20 locations have been made on them within the past ten days. They are plainly discernible for hundreds of feet on the surface, and the ledges vary from 18 inches to 3 feet in thickness. Mr. Strickland in his explorations ascended still further where he discovered and located an 18-inch ledge of beautiful quartz—similar to that of the Georgetown, Colorado, mines. Other new discoveries have been made still higher, but the season for prospecting in that altitude is about at an end, as the region of almost perpetual snow is close at hand. At the highest point gained by our informant he found a glacier of solid ice about 100 acres in extent, and could see six separate and distinct lakes in different basins of the mountains. His description of the scenery as beheld from his lofty perch would rival the glowing accounts of the Yosemite and other world-famed natural curiosities. His confidence in the country is unlimited and he bespeaks for it the grandest future of any camp on the coast. Osborn, Tartar, Leep and Denny have also made another valuable discovery of quartz on Snake river, near the mouth of Pine creek. These gentlemen own the Mountain Chief, Independence and Red Boy, four parallel veins within a belt of 400 feet, and the Greenhorn, 200 feet below the Mountain Chief, all a short distance above Cornucopia. The extension of the Red Boy, the Welcome, Golden Chariot, Queen of the West, Red Cross and Updyke ledges of which but little has heretofore been said are mines which give promise of great results. Mining men who have recently visited the camp are of the opinion that the bonding of mines by Neimer will be prolific of no good to the camp. He went in there and bonded the mines before they were in any degree developed, gave contracts for sinking at good figures and then left the men to complete the work. This established a bad precedent and was no incentive to induce other mine owners to develop their claims. Eastern men do such things, but western men have seen too many failures in mining enterprises to invest unless there is something in sight.

THE MAMMOTH BONDED.—Eedrock *Democrat*, Sept. 18: The Mammoth mine, about 30 miles southeast of Baker City, has been bonded to Eastern capitalists for \$50,000 for a period of six months, and already a force of men with a new outfit of tools are at work on the ledge. There is now a 5-stamp mill on the mine, and it has been used for several years, with fair results, although the process by which the ore was worked, saved only the free gold, while from the sulphurets, which are extremely rich and plentiful, no returns were obtained. A. B. Elmer, aware of this fact, succeeded in interesting Eastern parties in the enterprise, who claim their ability to work the sulphurets so as to obtain 95 per cent of the gold they contain. The mine has already been worked to a depth of 50 feet, and the ledge at that point measures 27 feet and 8 inches, and is much richer than on the surface. It will take some time to get the ledge in condition to work to an advantage as the parties last working it took out all the rock that could be easily obtained, but when it is thoroughly opened this vast ledge will be one of the cheapest to work and best paying mines in Eastern Oregon.

THE CALIFORNIA POWDER WORKS.

MANUFACTURERS OF

Sporting, Cannon, Mining, Blasting and HERCULES POWDER

HERCULES POWDER will break more rock, is stronger, safer and better than any other Explosive in use, and is the only Nitro-Glycerine Powder chemically compounded to neutralize the poisonous fumes, notwithstanding bombastic and pretentious claims by others.

It derives its name from HERCULES, the most famous hero of Greek Mythology, who was gifted with superhuman strength. On one occasion he slew several giants who opposed him, and with one blow of his club broke a high mountain from summit to base.

No. 1 (XX) is the Strongest Explosive Known.
No. 2 is superior to any powder of that grade.

PATENTED IN THE UNITED STATES PATENT OFFICE.

ORDERS RECEIVED FOR HERCULES CAPS AND FUSE.

JOHN F. LOHSE, SEC'Y.

Office, No. 230 California Street - - - San Francisco, Cal.

THE CONSUMERS' COMPANY.

VULCAN B B AND AJAX.

The Best LOW GRADE EXPLOSIVES in the Market.

SUPERIOR TO BLACK OR JUDSON POWDER.

Vulcan Nos. 1, 2 and 3,

The Best NITRO-GLYCERINE POWDERS Manufactured.

SPECIAL INDUCEMENTS IN PRICES.

AJAX and VULCAN B B POWDERS are Unequaled for Bank Blasting and Railroad Work.

Caps and Fuse of all Grades at Bottom Rates.

VULCAN POWDER CO.,
 218 California Street, San Francisco, Cal.

THE GIANT POWDER COMPANY

Manufacture Three Kinds of Powder, which are acknowledged by all the Great Chemists of the World as

The Safest and Strongest High Explosives in the Market.

GIANT POWDER or DYNAMITE,

Of Different Strengths as Required.

NOBEL'S EXPLOSIVE GELATINE," which contains 94 per cent of Nitro-Glycerine, an GELATINE-DYNAMITE, Stronger than Dynamite and even Safer in Handling.

JUDSON POWDER IMPROVED.

FOR RAILROADS AND LAND CLEARING. Is from three to four times stronger than ordinary Blast ng Powder, and is used by all the Railroads and Oravel Claims, as it breaks more ground, pulverizes better and aves time and money. It is as dry as the ordinary Blasting Powder and runs as freely.

BANDMANN, NIELSEN & CO.,

CAPS and FUSE for Sale.

GENERAL AGENTS, SAN FRANCISCO, CAL.

GOLD QUARTZ and PLACER MINERS' SILVER PLATED AMALGAMATING PLATES

FOR SAVING GOLD.

Have been Awarded the First Premium at Mechanics' Fair for the Last Thirteen Years.

Every description of plates for Quartz Mills and Wet or Dry Placer Amalgamator Machines made to order, corrugated or plain.

OVER 3,000 ORDERS FILLED!

References from every purchaser. Full weight of Silver guaranteed on every order.

The most extensive and successful manufacturer of these plates in the United States. Will fill orders for delivery in Rocky Mountain and Pacific Coast Mining States at lower prices than any other manufacturer.

Old Mining Plates Replated. Old Plates bought gold separated for low percentage of result.

...SOLE MANUFACTURERS OF...

KENDALL'S PATENT QUARTZ MILLS.

Having renewed our contract on more advantageous terms with Mr. S. Kendall for the manufacture of his Patent quartz Mill, we are now enabled to offer these mills at GREATLY REDUCED PRICES. Having made and sold these mills for the past five years, we know their merits, and know that they have given perfect satisfaction to purchasers, as numbers of commendatory testimonials prove. We feel confident, therefore, that at the prices we are now prepared to offer them, there is placed within the reach of all a light, cheap, and durable mill that will do all that claimed for it and give entire satisfaction.

Patent Agency.

[ESTABLISHED 1860.]

Inventors on the Pacific Coast will find it greatly to their advantage to consult this old experienced, first-class Agency. We have able and trustworthy Associates and Agents in Washington and the capital cities of the principal nations of the world. In connection with our editorial, scientific and Patent Law Library, and record of original cases in our office, we have other advantages far beyond those which can be offered home inventors by other agencies. The information accumulated through long and careful practice before the Office, and the frequent examination of Patents already granted, for the purpose of determining the patentability of inventions brought before us, enables us often to give advice which will save inventors the expense of applying for Patents upon inventions which are not new. Circulars of advice sent free on receipt of postage. Address DEWEY & CO., Patent Agents, 252 Market St., S. F.

THE JENKINS STANDARD PACKING

IS ACKNOWLEDGED BY USERS AS THE BEST in the world. Unlike all other Packings, the Jenkins Standard Packing can be made any thickness desired in a joint by placing two or as many thicknesses together as desired, and following up joint, it vulcanizes in place and becomes a metal of itself (it is frequently called Jenkins Metal), and will last for years, as it does not rot or burn out. Avoid all imitations, as a good article is always subject to cheap imitations. The genuine has stamped on every sheet "Jenkins Standard Packing," and is for sale by the Trade generally.

Manufactured only by

For Sale by
 DUNHAM, CARRIGAN & CO., San Francisco, Cal.

ANNOUNCEMENT.

The Clayton Air Compressor Works, of Brooklyn, have opened an office at No. 43 Dey Street, New York, for the sale of the Clayton Improved Air Compressors, Rock Drills, Mine Pumps, Hoisting Engines, Rock Crushers, Blasting Batteries, Wire, Fuse, and Mining Machinery in General. For Catalogue—August 1885—estimates and general information call upon or address, Clayton Air Compressor Works, Office, 43 Dey Street, New York.

[From the Engineering & Mining Journal, Aug. 8, 1885.]
The Clayton Air Compressor Works have issued a New Illustrated Catalogue and Price List. Every Mine Manager and Engineer should have a copy for reference, for none can afford to be without the information there given concerning the unsurpassed Clayton Air Compressors and other Machinery.

This paper is printed with Ink Manufactured by Charles Eneu Johnson & Co., 600 South 10th St., Philadelphia. Branch Office—47 Rose St., New York, and 40 La Salle St., Chicago. Agent for the Pacific Coast—Joseph H. Dorsey, 529 Commercial St., S. F.

Mining and Scientific Press.

THE BEST PRACTICAL MINING JOURNAL IN THE WORLD.

Established in 1860, this paper has been eminently successful as a popular and useful mining and mechanical journal. Relative to precious metals especially, it is the leading mining paper of the world.

It is largely patronized by the leading Miners, Mine Owners, Superintendents, Engineers, Metallurgists, Chemists, Manufacturers, Mechanics, Scientific, Professional and Industrial "Men of Progress" on the Pacific Coast, and many leading Mining Men throughout the mining fields of the world.

It is by far the best advertising medium in the Pacific States and Territories for Mining, Mechanical, Engineering, Building and Manufacturing Tools and Implements Goods, Supplies, etc.

Being thoroughly able and reliable in its editorial and business management, and long established in the most progressive industrial portion of the Union, at present, its power as an advertising medium is unsurpassed.

Subscription, \$3 a year. Advertising rates, moderate. Send for samples and further information.

DEWEY & CO., Publishers,
252 Market Street, San Francisco.

Mining Share Market.

Mining stocks continue rather dull. The chief point of interest in the Comstock mining situation continues to be the deep workings and developments of the Hale & Norcross and Chollar on the 300-foot level from the Combination shaft. The situation, briefly stated by the *Enterprise*, is as follows: The main drift west from the Combination shaft, owned jointly by the Chollar, Hale & Norcross and Savage companies, has penetrated westward about 140 feet to the main ore ledge, being at that point 60 feet south of the Hale & Norcross south line, in Chollar ground. A drift was branched off due north, skirting along the east wall of the ore vein, in order to meet the drift coming south along the east wall from the Hale & Norcross deep winze. This south drift from the winze is making excellent progress, considering the disadvantage in handling the waste or debris excavated, and the connection between the drifts is expected to be made in about ten days. Good bunches of ore are met with as the drift skirts along the east wall of the ore vein, occasionally cutting through the projections and offshoots, and when crosscutting is commenced, which will not be before the desired connection is made, giving plenty of good air circulation, a large body of excellent pay ore is confidently expected to be opened. Meanwhile the drift or crosscut west from the deep winze, on the same level, is making good westward progress, running through a heavy body of strongly mineralized quartz, which gives good assays and a substantial indication of the great ore body lying southward, which, judging from what is shown in the face of the Combination west drift, must be 200 or 300 feet wide.

As to the price or fluctuations in stocks, the middle mine managers care precious little. What they are after is to develop their mine and its bullion resources, and they are doing so very effectively. No other companies on the lode are helping them in the least, but all are waiting to see how their more enterprising neighbors are coming out. Therefore it is that Hale & Norcross rules the whole situation, and the future fate of the lower levels hinges upon it alone. It is the king pin, and the prices of all other mines are regulated by it alone. As Hale & Norcross goes up or down, so do all other stocks along the lode.

New Incorporations.

The following companies have been incorporated and papers filed in the office of the Superior Court, department 10, San Francisco.

PARADISE AND LOS ANGELES GOLD AND SILVER MINING LAND AND WATER CO.—Sept. 20th. Capital stock, \$1,000,000. Directors, J. M. Bowers, P. B. Nagle, W. W. Jenkins, T. R. Horton and A. H. Hogg.

ALBION RIVER R. R. CO.—Sept. 22d. Object to build a steam railroad in Mendocino county. The road will run along the north bank of the Albion river into what is known as Tide Water gulch. The route will be two and a half miles long and will have a branch road running up what is known as Railroad gulch. Capital stock, \$25,000. Directors, Wm. G. Byxbee, A. W. Starbird, J. B. Goldstone, C. W. Farnum and Henry Wetherbee.

Bullion Shipments.

Silver Bow, September 16, \$15,728; Clark & Larnie, 16, \$2880; Barber's mill, 20, \$7000; King, 20, \$7818; Calico mill, 20, \$1667; Hanauer, 15, \$5000; Stormont, 15, \$2290; Queen of the Hills, 15, \$1400; Ontario, 16, \$30,791; 17, \$37,041; Hanauer, 17, \$5500; Crescent, 17, \$1400; Queen of the Hills, 17, \$1200; Germania, 17, \$5053; Hanauer, 16, \$2900; Lost River, 19, \$2930; Queen of the Hills, 19, \$1400; Germania, 19, \$9578; Alice, 12, \$18,543; Lexington, 18, \$34,692; Silver Bow, 9, \$15,728; Moulton, 10, \$15,360; Alice, 15, \$19,088.

EXPLANATION.—Cl for clear; Cy, cloudy; Fr, fair; Fy, foggy; — indicates too small to measure. Temperature wind and weather at 12:00 M. (Pacific Standard time), with amount of rainfall in the preceding 24 hours.

Successful Patent Solicitors.

As Dewey & Co. have been in the patent soliciting business on this Coast now for so many years, the firm's name is a well known one. Another reason for its popularity is that a great proportion of the Pacific Coast patents issued by the Government have been procured through their agency. They are, therefore, well and thoroughly posted on the needs of the progressive industrial classes of this Coast. They are the best posted firm on what has been done in all branches of industry, and are able to judge of what is new and patentable. In this they have a great advantage, which is of practical dollar and cent value to their clients. That this is understood and appreciated, is evidenced by the number of patents issued through their SCIENTIFIC PRESS Patent Agency (S. F.) from week to week and year to year.

It is stated that a mill will be put up in the spring, and be run by the water-power derived from the water flowing from the Sutor tunnel. It will be used for working the vast body of low grade quartz cut through in excavating the tunnel. This vein is said to be 300 feet in width, and to give an average assay of \$4 per ton. The water will be flumed to the mill on a trestle, and the trestle will be built wide enough to allow of the construction of tracks on either side on which to run out the quartz from the tunnel to the mill. It is estimated that by this method the poorest quartz can be mined and crushed for \$2 a ton.

MINERVA DISTRICT, a new mining camp in Nevada, located on the western slope of the Soake Range, 15 miles south of Osceola and about 35 miles from Taylor, bids fair in the near future to become an important bullion producing district. The ledges are numerous and large, some of them being 15 to 25 feet wide, and traceable on the surface for the full length of the claims (1500 feet), and the ore is generally of a high grade. Wood and water are abundant.

APPRECIATIVE.—One of our old subscribers writes as follows: "I am a constant reader of the MINING AND SCIENTIFIC PRESS, and am pleased to notice a steady, unceasing improvement in the literary excellence of the journal. You are specially favored with an able and trustworthy staff of assistants, as attested by their good works."

To Young Men and Young Women.

All competent boys and girls should prepare themselves for usefulness in business if they wish to "step up higher." We have for sale to such, on easy and favorable terms, a scholarship in one of the best business colleges in the U. S. Address this office.

A NEW mill is to be placed on North Star mine, near the north fork of Trinity river. The mine is owned by Goodyear & Co.

List of U. S. Patents for Pacific Coast Inventors.

From the official list of U. S. Patents in DEWEY & CO.'S SCIENTIFIC PRESS PATENT AGENCY, 252 Market St., S. F.

FOR WEEK ENDING SEPTEMBER 15, 1885.

326,198.—HYDROMOTOR FOR STREET R. R.—R. F. Bredwell, S. F.

326,201.—PUMP—John P. Cobb, College City, Cal.

326,209.—SINGLE ACTING PUMP—W. H. De Valin, San Rafael, Cal.

326,208.—CULTIVATOR—Geo. W. Forbes, Guberville, Cal.

326,210.—CABLE RAILWAY—J. D. Isaacs, Oakland, Cal.

326,122.—HEMIAL TRUSS—Nathl Jones, Berkeley, Cal.

326,434.—PUMP—L. A. Kelly, Dayton, W. T.

326,231.—BULLET—Frank Manning, Marysville, Cal.

326,314.—PRUNING SHEARS—L. M. McKay, Pomona, Cal.

326,144.—PROPELLING RAILWAY CARS—Geo. Parry, S. F.

326,145.—PROPELLING RAILWAY CARS—Geo. Parry, S. F.

326,516.—SHEET METAL PIPE MACHINE—M. K. Pierce, Perryville, Cal.

326,243.—SAW GUMMER—S. J. Randall, Moodyville, B. C.

326,253.—CRUSHING AND GRINDING MILL—W. C. Stiles, S. F.

NOTE.—Copies of U. S. and Foreign patents furnished by Dewey & Co., in the shortest time possible (by telegraph or otherwise), at the lowest rates. American and Foreign patents obtained, and all patent business for Pacific Coast inventors transacted with perfect security and in the shortest possible time.

Notices of Recent Patents.

Among the patents recently obtained through Dewey & Co.'s SCIENTIFIC PRESS U. S. and Foreign Patent Agency, the following are worthy of special mention:

PUMP.—John P. Cobb, College City, Colusa county. No. 326,201. Dated Sept. 15, 1885.

This pumping apparatus is specially designed for irrigation and other purposes where it is necessary to throw a considerable body of water. It consists of a series of pump cylinders, extending radially and horizontally from a central casing, the oppositely placed cylinders having pistons and rods extending from them into the central casing, where they are actuated by reciprocating racks driven by gearing upon a central shaft, and in connection with these the driving mechanism and discharge pipes.

BULLET.—Franklin Manning, Marysville. No. 326,231. Dated Sept. 15, 1885. This invention relates to an improved bullet or projectile for firearms or rifled guns, and it consists of a head or front portion having a diameter smaller than that of the interior of the gun; a series of cannelures with intervening projecting rings or ridges, which have a diameter sufficient to fit the grooves or rifling of the gun, the channels or cannelures between said ridges gradually deepening from the rear of the bullet toward the front, while the deepest channel or groove is made in front of the last ring, and between it and the head of the bullet.

CULTIVATOR.—Geo. W. Forbes, Guberville, Santa Clara county, No. 324,208. Dated Sept. 15, 1885. This improvement in wheeled cultivators consists in the novel mechanism by which the tooth frame is connected with and raised and lowered by the crank axle, in the location of the seat in the independent, removable and adjustable tooth sockets, and in various details of construction. The object of the invention is to provide a cultivator which can be easily and readily adjusted to throw its teeth into or out of the ground, and which is adapted to receive substitute teeth or blades either of the same or of a different pattern.

FRUIT-DRYER.—Ambrose Blachley & A. T. Hatch, S. F. No. 325,782. Dated Sept. 8, 1885. This drying apparatus consists of chambers having vertical diaphragms or partitions at intervals, with leaves or shutters formed in them, by which the current of air which passes through the chamber from the furnace, situated at one end, to the suction-fan or draft apparatus at the opposite end, may be regulated, and the current thrown downward or upward as may be desired. Cars carrying trays to receive the fruit are caused to run in and out of these chambers, which are provided with suitable doors. The number of chambers in the series can be increased as long as the current of air can be profitably drawn through them.

HYDROMOTOR FOR STREET RAILWAYS.—Richard F. Bredwell. No. 326,198. Dated Sept. 15, 1885. This is a novel apparatus, which the inventor calls a "hydromotor," for car propulsion, and it consists of an underground slotted tube, into which a shank from the car extends, and upon the slot irons of which a single line of wheels run and support the car; a central longitudinal water pipe within the tube with a flattened top, upon which a channeled casing and shoe at the lower end of the shank fits and travels, a plate or abutment at the front of the shoe, and vertically moving gates on the pipe, acted upon by the passing shoe, so as to admit water into a temporarily-enclosed space, where, by its pressure, it acts to drive the shoe and car along.

MULLER'S pebble spectacles are the best. 135 Montgomery St., near Bush, opp. Occidental. x

Inducements to Subscribers.

To favor subscribers to this paper, and to induce new patrons to try our publication, we offer the following advantages to all new subscribers who pay one year in advance, or present subscribers who will pay their subscriptions up to a date fully one year in advance of the present time. We will furnish the following articles (while this notice continues), at the reduced rates named, viz.:

- 1.—World's Cyclopedia, 791 pages, with 1,200 illustrations, worth \$1.75. Postpaid for 50 cts.
- 2.—Patent Binder (cloth cover) with name of this paper in gilt. Postpaid for 50 cts. \$1.00
- 3.—To New Subscribers, 12 select back Nos. of the MINING AND SCIENTIFIC PRESS. Free .75
- 4.—Any of Harper's first class periodicals, 15 per cent less than regular rates.
- 5.—Frank Leslie's and most other U. S. periodicals, 15 per cent discount from regular rates.
- 6.—Pacific Coast and Eastern Bibles, Books and Periodicals, except special publications, we can usually give 10 to 15 per cent less than advertised retail rates.
- 7.—Picturesque Arizona, 350 pages, in cloth and gilt. Postpaid for 25 cts. 1.25
- 8.—California, 160 pages, Magazine, best to 1882 (3 Vols.) single Nos. Postpaid for 3 cts. .35
- 9.—Per volume, unbound, 5 Vols., Postpaid for 20 cts. 2.00
- 10.—Per volume, bound, cloth back and stiff paper sides. Postpaid for 40 cts. 2.50
- 11.—Picturesque California Homes (40 building plans and estimates). Postpaid for \$1 3.50
- 12.—Dewey's Patent Newspaper File Holder (18 to 36 inch). 25 cts. .50

NOTE.—The cash must accompany all orders. If too much is sent for any article or publication, the balance will be returned immediately. Address this office, No. 252 Market St., S. F.

P. S.—No. 11 is really a valuable premium to new-comers and others who appreciate the better class of stories and a good standard of California literature.

- Webster's Dictionary, 634 pages, with 1,600 illustrations. 50 cts. 1.50
- Grant Lithograph, size 24x19. 50 cts. .50
- Cleveland Fine Steel Plate, size 12x16. 10 cts. .50
- Grant Steel Plate, cabinet size. 5 cts.
- De Groot's History of Mining in California. 5 cts. .25
- Beautiful Book-Review, a handsome, entertaining and instructive souvenir of real merit. 25 cts. .50

Send for any further information desired. Readers will please inform their new neighbors and others concerning our paper and these offerings. On application, sample copies of this paper will be mailed free to the address of any persons thought likely to subscribe.

NEW BOOKS ON ASSAYING.

By C. H. AARON.

PART I.—Gold and Silver Ores.—Price \$1.

This new work is written by an experienced metallurgist who has devoted many years to assaying and working precious ores on the Pacific side of the American Continent. He writes thereof from personal practice, and in such plain and comprehensive terms that neither the scientist nor the practical miner can mistake his meaning. The work, like Mr. Aaron's former publications ("Testing and Working Gold and Silver Ores," "Leaching Gold and Silver Ores") that have been "unsuccessfully popular" is written in a condensed form, which renders his information more readily available than that of more wordy and less consistent writers. The want of such a work has long been felt. It will be very desirable in the hands of many.

Table of Contents:

Preface; Introduction; Implements; Assay Balance; Materials; The Assay Office; Preparation of the Ore; Weighing the Charge; Mixing and Charging; Assay Litharge; Systems of the Crucible Assay; Preliminary Assay; Dressing the Crucible Assay; Examples of Dressing; The Melting in Crucibles; Scoriafication; Cupellation; Weighing the Bead; Parting; Calculating the Assay; Assay of Ore Containing Coarse Metal; Assay of Roasted Ore for Solubility; To Assay a Cupel; Assay by Amalgamation; To Find the Value of a Specimen; Tests for Ores; A Few Special Minerals; Solubility of Metals; Substitutes and Expedients; Assay Tables.

The volume embraces 106 12mo. pages, with illustrations, well bound in cloth. Price, \$1.00. Sold by DEWEY & CO., Publishers, No. 252 Market street, San Francisco.

PARTS II AND III.

Lead, Copper, Tin, Mercury, etc. Price \$1.75.

This book is entitled "Assaying—Parts II and III," and is separate from Part I, and treats of Gold and Silver Bullion, Lead, Copper, Tin, Mercury, Zinc, Nickel, Cobalt, etc.

Table of Contents:

Gold and Silver Bullion; Apparatus; Melting Bullion; Assaying Bullion; Humid Assay of Silver; Manipulation, etc.; Lead Ores; Copper Ores; Volumetric Assays; Parting; Processes; Amalgamation; New Process; Preparation of Potassium Zanthate; Electrolytic Determination of Copper in Ores, etc.; Assaying of Tin Ores; Assaying of Mercury Ores; Assaying of Zinc Ores; Assaying of Zinc Ores, New Method; New Assay of Nickel and Cobalt; Assay of Chromium; Assay of Bismuth; Assay of Arsenic; Assay of Antimony; Assay of Sulphur; Assay of Salt; Appendix to Part I; Notes on Crucible Assays; Weighing by Oscillations; Appendix to Part III; The Assay of Lead; The Assay of Copper.

There are 160 12mo. pages with illustrations in the volume, which is bound strongly in cloth. Price postpaid, \$1.75. Sold by DEWEY & CO., Publishers, No. 252 Market St., S. F.

These are much needed books for miners and other practical men, by an intelligent and careful assayer and careful writer. They are invaluable for the mill and mine worker, and equally good for sale to the experts. They are thoroughly practical books.

A Handsome Premium.

The publishers of this paper have had printed on fine paper and handsomely bound, a neat little volume, entitled "A Beautiful Poetic Review and Friendly Offering." It was written by Dr. J. R. Bradway, orator of Oakland Council, American Legion of Honor, and read in short sections by the author at different meetings, eliciting much praise from his listeners. The work is embellished with fine lithographic portraits of several noted poets whose writings are mentioned in the work. We believe the book will prove a pleasant and attractive keepsake in every family—it can be so readily taken up and read as leisure moments may occur. It will be mailed for 25 cents to subscribers (old or new), upon paying 12 months in advance for this paper. Or to those who pay one year and three months in advance we will send this beautiful souvenir free, postpaid.

At Harney's Peak, Dakota, where tin was discovered in June, 1883, there are now 1000 claims located, many of which are tin-bearing and in process of development.

Very Acceptable Present.

Stereoscopic and Cabinet Views.

We are Sole Agents for the Pacific Coast for the views of the Continent Stereoscopic Company, consisting of a most complete series of photographic views of all popular localities west of the Rocky Mountains. They represent all the principal locations of the Pacific Coast, including views in

California. Yosemite. Colorado. Oregon. Alaska. Arizona. New Mexico.

Columbia River. City of San Francisco. Washington Territory. Union Pacific Railroad. Nevada and the Northwest.

And Types of Indians of all Races.

Send for a sample hundred of our views, which will give you an idea of the quality of our goods. New subjects from all sections are constantly being added.

Price \$8 per hundred. Liberal discount to the Trade.

We want to particularly inform those heretofore using these goods that the line has just been revised, with new Subjects, both Cabinet and Stereoscopic. We respectfully solicit your patronage.

CUBERY & CO.,

Printers and Dealers in Cards for all Societies.

415 MARKET ST., below First, SAN FRANCISCO.

DRY WASHER for PLACERS

THE HITCHCOCK & HERSHEY

NEW DRY GOLD CONCENTRATOR

This Machine weighs only 325 pounds; readily taken apart; packs in small compass; may be run by hand or horse power. Capacity, two tons an hour. No blowers or 6x1 fans, or quicksilver used. Frame all malleable iron. Will save a higher percentage of gold than other machines. TATUM & BOWEN, San Francisco and Portland, Agents.

Now on exhibition at Mechanics' Fair, San Francisco, where it may be seen in operation.

METALLURGICAL AND MINING ENGINEER, H. SALAZAR, ASSAYER AND CHEMIST.

PACIFIC Reduction & Metallurgical Works.

SALAZAR & KUSTEL, Managers.

Location of Works: Melrose, Alameda Co., Cal.

Office: 318 Pine Street (Basement), San Francisco.

SAN FRANCISCO CREMATION CO.

[INCORPORATED SEPT. 5, 1885.]

CAPITAL STOCK, \$25,000, divided into 500 shares of the par value of \$50 each.

217 Shares Have Been Taken.

The remaining shares are now offered for sale and may be subscribed for at the office of GENERAL H. A. CORB, 321 Montgomery St., where further particulars may be obtained; also at the office of the Secretary, 100 Battery St. By order of the Board of Directors. MAX LEVY, Secretary.

L. PETERSON, INVENTORS. MODEL MAKER,

258 Market St., N. E. cor Front, up-stairs, S. F. Experimental machinery and all kinds of models, tin, copper and brass.

Complimentary Samples.

Persons receiving this paper marked are requested to examine its contents, terms of subscription, and give it their own patronage, and, as far as practicable, aid in circulating the journal, and making its value more widely known to others, and extending its influence in the cause it faithfully serves. Subscription rate, \$3 a year. Extra copies mailed for 10 cents, if ordered soon enough. If already a subscriber please show the paper to others.

Don't Fail to Write.

Should this paper be received by any subscriber who does not want it, or beyond the time he intends to pay for it, let him not fail to write us direct to stop it. A postal card (costing one cent only) will suffice. We will not knowingly send the paper to anyone who does not wish it, but if it is continued, through the failure of the subscriber to notify us to discontinue it, or some irresponsible party requested to stop it, we shall positively demand payment for the time it is sent. LOOK CAREFULLY AT THE LABEL ON YOUR PAPER.

Dewey & Co., American and Foreign Patent Agents.

PATENTS obtained promptly; Caveats filed expeditiously; Patent Reissues taken out; Assignments made and recorded in legal form; Copies of Patents and Assignments procured; Examinations of Patents made here and at Washington; Examinations made of Assignments recorded in Washington; Examinations ordered and reported by Telegraph; Rejected cases taken up and Patents obtained; Interferences Prosecuted; Opinions rendered regarding the validity of Patents and Assignments; Every legitimate branch of Patent Soliciting promptly and thoroughly conducted.

Our intimate knowledge of the various inventions of this coast, and long practice in patent-business, enable us to abundantly satisfy our patrons; and our success and business are constantly increasing.

The shrewdest and most experienced Inventors are found among our most steadfast friends and patrons, who fully appreciate our advantages in bringing valuable inventions to the notice of the public through the columns of our widely circulated, first-class journals—thereby facilitating their introduction, sale and popularity.

Foreign Patents.

In addition to American Patents, we secure with the assistance of co-operative agents, claims in all foreign countries which grant Patents, including Great Britain, France, Belgium, Prussia, Austria, Baden, Peru, Russia, Spain, British India, Saxony, British Columbia, Canada, Norway, Sweden, Mexico, Victoria, Brazil, Bavaria, Holland, Denmark, Italy, Portugal, Cuba, Roman States, Wurtemberg, New Zealand, New South Wales, Queensland, Tasmania, Brazil, New Granada, Chile, Argentine Republic, AND EVERY COUNTRY IN THE WORLD where Patents are obtainable.

No models are required in European countries, but the drawings and specifications should be prepared with thoroughness, by able persons who are familiar with the requirements and changes of foreign patent laws—agents who are reliable and thoroughly established.

Our schedule price for obtaining foreign patents, in all cases, will always be as low, and in some instances lower, than those of any other responsible agency.

We can and do get foreign patents for inventors in the Pacific States from two to six months (according to the location of the country) SOONER than other agents.

The principal portion of the patent business of this coast has been done, and is still being done, through our agency. We are familiar with, and have full records, of all former cases, and can more correctly judge of the value and patentability of most inventions discovered here than any other agents.

Situated so remote from the seat of Government, delays are even more dangerous to the inventors of the Pacific Coast than to applicants in the Eastern States. Valuable patents may be lost by extra time consumed in transmitting specifications from Eastern agencies back to this coast for the signature of the inventor.

Confidential.

We take great pains to preserve secrecy in all confidential matters, and applicants for patents can rest assured that their communications and business transactions will be held strictly confidential by us. Circulars of information to inventors, free.

Home Counsel.

Our long experience in obtaining patents for inventors on this Coast has familiarized us with the character of most of the inventions already patented; hence we are frequently able to save our patrons the cost of a fruitless application by pointing to them the same thing already covered by a patent. We are always free to advise applicants of any knowledge we have of previous applicants which will interfere with their obtaining a patent.

We invite the acquaintance of all parties connected with inventions and patent right business, believing that the mutual conference of legitimate business and professional men is mutual gain. Parties in doubt in regard to their rights as assignees of patents or purchasers of patented articles, can often receive advice of importance to them from a short call at our office.

Remittances of money, made by individual inventors to the Government, sometimes mis-overy, and it has repeatedly happened that applicants have not only lost their money, but their inventions also, from this cause and consequent delay. We hold ourselves responsible for all fees entrusted to our agency.

Engravings.

We have superior artists in our employ, and all facilities for producing fine and satisfactory illustrations of inventions and machinery, for newspaper, book, circular and other printed illustrations, and are always ready to assist patrons in bringing their valuable discoveries into practical and profitable use.

HOOD'S FOUNDRY COKE.

Consumers are respectfully informed that owing to inferior brands of Coke having been sold in this and other countries under the name of "Patent Coke," the Glamorgan Coal Co. (Limited), Cardiff, in May, 1884, abandoned the title of "Patent Foundry Coke," substituting that of "Hood's Foundry Coke."

This Coke is exclusively used by the Selby Smelting and Lead Co., Union Iron Works, Professor Thomas Price, and other consumers here. Large quantities are regularly forwarded to Copper Smelters in Arizona and New Mexico, and also to consumers in Nevada and Salt Lake. The undersigned are the SOLE IMPORTERS of the above Coke, which is for sale in quantities to suit purchasers.

BALFOUR, GUTHRIE & CO.,
316 California St., San Francisco.

F. A. HUNTINGTON'S CENTRIFUGAL ROLLER QUARTZ MILL.

Economy in Expense of Plant. Economy in Cost of Working. Economy in Saving Gold. Economy in Transportation of Machinery. Economy in Cost of Erection of Mill at Mine. Economy in Time Required to Establish Plant (one day only being consumed).

The Huntington Mill has passed entirely through the experimental stage. Two years of continuous use at a number of mines in California has enabled the inventor to perfect and improve the machinery until he feels justified in assuring the public that he has reached THE ABSOLUTE in the construction of a perfect Quartz Mill.

PLANTS FOR GOLD AND SILVER MILLS,
embracing machinery of LATEST DESIGN and
MOST IMPROVED construction. We offer our cus-
tomers the BEST RESULTS of 35 YEARS' EX-
PERIENCE in this SPECIAL LINE of work, and
are PREPARED to furnish from SAN FRAN-
CISCO or CHICAGO, the MOST APPROVED
character of MINING and REDUCTION MA-
CHINERY, adapted to all grades of ores and SU-
PERIOR to that of any other make, at the LOWEST
POSSIBLE PRICES.

We are also prepared to CONSTRUCT and DE-
LIVER in COMPLETE RUNNING ORDER,
in any locality, MILLS, CONCENTRATOR
WORKS, WATER JACKET SMELTING
FURNACES, HOISTING WORKS, PUMP-
ING MACHINERY, ETC., ETC., of any DE-
SIRE CAPACITY.

WATER JACKET SMELTING FURNACES

For COPPER and ARGENTIFEROUS LEAD
ores of NEW and ORIGINAL DESIGNS, covered
by LETTERS PATENT. No other Furnace CAN
COMPARE with these for DURABILITY, and in
CAPACITY for uninterrupted work. MORE
THAN 150 of them are now RUNNING in various
parts of THIS COUNTRY, as well as many in
FOREIGN COUNTRIES, giving results NEVER
BEFORE ATTAINED as regards CONTINUOUS
running, ECONOMY of fuel, AMOUNT and QUAL-
ITY of BULLION produced. These CLAIMS have
been PROVEN BY RESULTS in ANY NUM-
BER of INSTANCES, and the GREAT SUP-
REMACY of this SYSTEM of smelting ores DI-
MONSTRATED BEYOND QUESTION. COM-
PLETE PLANTS furnished to order of any CA-
PACITY, with ALL IMPROVEMENTS that ex-
perience has DEMONSTRATED as VALUABLE
in this class of work.

Beyond question the cheapest and
most effective machine of the kind
now in use adapted to all grades and
classes of ores.

This machine has been THOROUGHLY TESTED
for the past TWO YEARS, under a GREAT VA-
RIETY of CONDITIONS, giving most EXTRA-
ORDINARY results FAR IN ADVANCE of
anything EVER BEFORE REALIZED. A re-
cent COMPETITIVE TEST at the Carlisle Mine in
Mexico, showed an ADVANTAGE OF OVER 30
PER CENT in favor of THE DUNCAN. The
amount SAVED OVER THE FUEL being suffi-
cient to PAY THE ENTIRE COST of the ma-
chines EVERY MONTH OF THE YEAR. One
of its MOST VALUABLE features is as an AMAL-
GAMATOR. It saves all THE AMALGAM GOLD
AND SILVER that ESCAPES the BATTERIES,
PANS or SETTLERS, making the machine worth
MORE than ITS COST for THIS PURPOSE
ALONE.

Baker's Mining Horse Power.

Possessing all the requirements of a first-class hoist,
and affording means for the continuous operation of a
Pump or Blower, without interfering with a hoisting ap-
paratus. It is made entirely of iron, no piece weighs
over 300 pounds. At the ordinary speed of a horse, a
1,000-pound bucket of ore may be raised 120 feet per
minute. The hoisting-drum is under the complete con-
trol of the man of the shaft, and is capable of carrying
500 feet of five-eighths steel rope. SEND FOR CIRCULAR.

PACIFIC ROLLING MILL CO.,

.....MANUFACTURERS OF.....

Cast Steel Castings and Steel Forgings

UP TO 20,000 LBS. WEIGHT.

True to pattern and superior in strength, toughness and durability to Cast or Wrought
Iron in any position or for any service.

GEARINGS, SHOES, DIES, CAMS, TAPPETS, PISTON-HEADS, RAILROAD and MA-
CHINERY CASTINGS of Every Description.

— ALSO —

HOMOGENEOUS STEEL, SOFT and DUCTILE, SUPERIOR TO IRON FOR LOCOMOTIVE AND MARINE FORGINGS.

ALSO Steel Rods, from 1/2 to 3 inch diameter and Flats from 1 to 8 inch. Angles, Tees, Channels and other shapes
Steel Wagon, Buggy, and Truck Tires, Plow Steel; Machinery and Special Shape Steel to size and lengths.
STEEL RAILS from 12 to 45 pounds per yard. ALSO, Railroad and Merchant Iron, Rolled
Beams, Angle, Channel, and T Iron, Bridge and Machine Bolts, Lag Screws, Nuts, Washers, Ship and Boat
Spikes; Steamboat Shafts, Cranks, Pistons, Connecting Rods, etc. Car and Locomotive Axles and Frames,
and Iron Forgings of all kinds, Iron and Steel Bridge and Roof Work a Specialty.

HIGHEST PRICE PAID FOR SCRAP IRON AND STEEL.

Orders will have prompt attention. Send for Catalogues. Address:

\$1,000 CHALLENGE!

**THE FRUE ORE CONCENTRATOR,
OR VANNING MACHINE.**

PRICE: FIVE HUNDRED AND SEVENTY-FIVE DOLLARS,
(\$575 00), F. O. B.

OVER 1,000 ARE NOW IN USE. Saves from 40 to 100 per cent more than any other Concentrator Concentrations are clean from the first working. The wear and tear are merely nominal. A machine can be seen in working order and ready to make tests at the Fulton Iron Works, No. 220 Fremont Street, San Francisco.

As the result of a suit East against an End-Shake Machine (the Embrey), similar to the Triumph, the Frue Vanning Machine Company owns the Embrey patent, and can put in the market an End-Shake Machine of earlier patent that will do as good work as the Triumph, and superior in construction and durability. There will be no risk of suit for infringement.

The Frue Vanning Machine Company warn the public that they claim and will prove the Triumph machine to be an infringement on patents owned by them.

Protected by patents May 4, 1869, Dec. 22 1874, Sept. 2, 1879, April 27, 1880, March 22, 1881, Feb. 20, 1883, Sept. 18, 1883. Patents applied for.

N. B.—We are and have been ready at any time to make a competitive trial against the Triumph, or any other Concentrator for stakes of \$1,000.

ADAMS & CARTER, Agents Frue Vanning Machine Co.,

Room 7—No. 109 California Street, — — — SAN FRANCISCO, CAL.

\$1,000 CHALLENGE ACCEPTED!

PRICE, FIVE HUNDRED AND FIFTY DOLLARS
(\$550.00), F. O. B.

THE "TRIUMPH" TRIUMPHANT!

**THE
"TRIUMPH" ORE CONCENTRATOR.**

In a competitive trial recently had between two of the "Triumph" Ore Concentrators and the same number of "Frue" Vanning Machines, at the mill of the celebrated gold producing Original Empire Mill and Mining Company, in Grass Valley, Nevada County, Cal., the "Triumphs" produced thirteen and fifteen one-hundredths (13.15) per cent more concentrations than did the "Frue" Vanners, during a run of twenty-four consecutive days, or a net gold coin result of \$190.15, or \$8.30 per day, in favor of the two "Triumph" Concentrators.

These returns do not include the value of the amalgam saved by the "Triumphs" during the test; which will add to the net gain. The form of construction of the feed bowl is such that considerable amalgam is necessarily saved, which is lost on the "Frue" Vanners.

This trial was conducted under the personal supervision of the Manager and Superintendent of that Company, in a strictly fair and impartial manner, and with the sole view of determining, in the interest of that Company, the merits and demerits of the respective machines by a thoroughly practical test. A relation of the course of procedure, a concise analysis of assays, and a tabulated statement of the net bullion results, with accurate deductions therefrom, will soon be published in Circular form.

The superiority of the present construction of the "Triumph" over the form originally introduced, together with the demonstrated results of the above, and other trials had with the "Frue" Vanners, induce us to and we hereby accept the Challenge of \$1,000, flouted by the Agents of the "Frue Vanning Machine Company," and hold ourselves in readiness to enter into a second competitive trial for that sum, at such place and upon such terms and conditions as may hereafter be mutually arranged.

We guarantee purchasers against all costs, expenses or charges incurred by reason of any infringements of any existing patents.

"Put up or shut up," and "Let the Best Machine win!"

Electric Transmission of Power.

Keith's Dynamo Machine.

We illustrate herewith Keith's dynamo, a recent invention of one who has been long and favorably known in electrical science. Its manufacture has been established in San Francisco, at the Union Iron Works, by the Pacific Coast Electrical Construction Company, and because it possesses many novel features which insure efficiency and endurance beyond many older and well-known machines, we will describe it, after briefly stating the general principles which govern such apparatus.

Fifty years ago the learned Faraday discovered that currents of electricity were induced in wires moved in the neighborhood of magnets, and that if the ends of the wires were connected so as to form electric circuits, the currents so induced would flow in the wires; and that such currents were identical with the currents from galvanic batteries. He also showed that power was required to move the wires so to produce electricity, and that if electricity was caused to flow through the same wires from some other source, the wires would move to produce mechanical power.

The dynamo, or machine for the mechanical production of electricity, was very tardy in its appearance, and it was not until 1856 that the machine of Siemens was produced, which was the first to attract any considerable attention. Thereafter followed its modifications made by Wilde and Ladd; and then, in 1869, by another of Siemens' invention; and about this time by that of the consequently famous Gramme. Upon this introduction and success of this latter, the modern science of dynamic electricity may be said to have its foundation.

Faraday discovered the principle, and others made the apparatus in which the principle was embodied. Briefly then, a dynamo-electric machine—or, dynamo for short—is a machine run by power for moving wires in the neighborhood of magnets for the purpose of producing electricity. It is also reversible—that is, it may be a machine through the wires of which currents of electricity may be passed to move the wires in the neighborhood of magnets to produce power.

It is theoretically propounded that lines of force proceed from the poles of magnets and curve from pole to pole, and that the currents of electricity are produced in the moving wires from crossing these lines of force. It has also been found that where these lines of force are the most dense, and that is at the shortest possible distance from the poles of the magnets, the greatest inducing effect in the production of electricity is produced, and that like effects are produced by concentrating these lines of force so as to act as a whole upon the moving wires, instead of being lost in part in space unoccupied by wires.

The magnets of dynamos are generally electro-magnets, i. e., magnets formed of cores of soft iron surrounded by coils of wire conducting currents of electricity, in preference to permanent magnets, which are of hard steel magnetized. Electro-magnets are only strong when electricity flows in their coils of wire.

These magnets of a dynamo are generally made the frame of the machine, and are called the "field magnets," and the moving masses of iron covered by wires are called "armatures." In the operation of a dynamo one of these masses, called an armature, is rotated between certain parts of the frame of the machine, which parts are called the poles of the field magnets.

These magnets and armatures have been made of many forms and of many varieties of shapes and sizes relative to each other, in this effort, when intelligently made, to produce the greatest concentration of the lines of force proceeding from the field magnets upon the wires of the rotating armature. Upon this success attained in this line depends the value of the dynamo. Many haphazard, rule-of-thumb designs have been made by inexperienced men as dynamos, but with little to recommend them in either the electrical or mechanical point of

somewhat after the manner of winding of the well-known Gramme dynamo armature, but differing in the manner of laying the wires relative to one another. The currents of electricity generated in these wires are conducted through the wires surrounding the cores of the field magnets, as in other dynamos.

This feature which is specially noticed by the electrician and others who have had experience with other dynamos, is the simplicity of construction and the small amount of wire upon the machine. Our illustration is made from a photograph of the 30 arc-light machine, lately exhibited at the Mechanics' Fair. It weighs 1600 pounds in all, and there is but 118 pounds of wire in the four field-magnet coils, and but 28 pounds of wire on the armature. The armature is 11 inches in diameter, and is rotated 1100 turns per minute to supply 30 arc-lamps with a current of thirteen hundred volts and twelve

ing electric energy equal to 90 per cent of that power, or 90-horse-power utilizable in the electric circuit of the dynamo. Suppose then a second dynamo with a capacity of converting 90 per cent of this electrical energy to mechanical power, and located any distance away from the first, like 1000 feet or ten miles: we would have at our command at the second dynamo 90 per cent of 90 per cent, or 81-horse-power from the primary 100-horse-power, and at a very little cost. But there must be deducted from this the power absorbed by the wires connecting the two dynamos, say from one to ten, or more per cent, according to the distance and the size of the conducting wires.

But it is not imperative that only one motor be placed upon such an electric circuit. Two or more may be placed on it and the energy may be divided among them, though placed far apart and doing a variety of kinds of work.

Take, for instance, a mine which may have its drilling, hauling, hoisting, pumping, milling, lighting, etc., done by electricity generated at a distance from the works at which utilized.

At the Mechanics' Fair a Keith small dynamo was run in the exhibit of the San Francisco Tool Company, and the electricity so generated was conducted by wire to the exhibit of the Pacific Electric Motor Company, where it was utilized in running several small electric motors attached to sewing machines. On the same circuit was another Keith dynamo in the exhibit of the Pacific Coast Electrical Construction Company, and this utilized some of the same electrical energy by operating a pump which raised 18,000 gallons of water per hour 17 feet high so that it might return as a waterfall. This waterfall was illuminated by electric lights placed in the falling water. Each sewing machine was under complete control of its operator, so that it was started, run, or stopped instantly at

will. Dynamos can be made of any desirable size, ranging from a fraction of a horse-power to that of many hundreds. We expect to see them in very extensive use through the mining and manufacturing regions, not only for lighting purposes, but for the very important one for purposes of power. They are coming into use in various parts of Europe and the United States in running railroads, elevators and their hoisting rigs, and for various other purposes.

Imagine a machine shop in which there are no shafting and belting: but each lathe, drill-press, planer, boring machine, etc., is run by its special dynamo directly attached, and receiving its electrical energy by a wire running from a large dynamo in the engine room, or at a waterfall perhaps miles away! Yet this can be done; and is but the elaboration of the modern practice, fast coming into extensive use, of attaching a steam engine to each considerable user of power in large works, because found more economical than deriving the needed power through belts, gears and shafting.

We are pleased at the establishment of this industry in San Francisco, and shall take pleasure in recording its practical applications in all its branches. We refer our readers to the advertisement of the Pacific Coast Electrical Construction Company in our advertising columns.

KEITH'S IMPROVED DYNAMO-ELECTRIC MACHINE.

view. Some of these dynamos have achieved commercial success because they were put on the market in a business-like way before better ones had been invented or constructed.

It follows, then, from these considerations, that the principles being known, the inventor has but to make the due mechanical combinations to achieve success in their manufacture, and this has been done by the inventor of the dynamo under consideration; and in evidence of this, the grand silver medal of the Mechanics' Institute has been awarded for its superiority over those exhibited at the recent fair, from the factory of the most widely celebrated dynamo makers of the world.

The north pole of the dynamo (see illustration) is the curved iron piece above the name-plate; and the south pole is the like piece below the name-plate. These poles are the joint ones of two horse-shoe electro-magnets, the cores of which constitute the frame of the machine. The pole pieces and the frame are of the best wrought iron, because that material is much better for the purpose than is cast-iron. They constitute the field magnets.

The armature is the cylinder in the cylindrical space between the poles. This is made up of disks of thin soft sheet iron, mounted on a spider, and covered with convolutions of wire wound parallel with, and radial to, the shaft,

amperes. There are but four layers of wire in each of the four field magnet coils, and but two layers of wire on the armature. To the electrician these facts carry an important meaning, which is, there is less power wasted in the coils of the machine than in others, and in proportion to the less length of wire used.

Electricians have determined the dynamic equivalent of electrical energy, and have invented instruments by which measurements of this energy may be readily made. The ratio of conversion of mechanical energy or power into electricity, or electrical energy, by this dynamo, and utilizable in the electric circuit external to the dynamo, exceeds 90 per cent. Conversely it will convert a like percentage of electrical energy to utilizable power.

As all mechanical operations are simply the conversion or translation of motion, and are effected more or less cheaply in proportion to the percentage of conversion or translation, it would seem that we have in these machines highly economical means of converting mechanical power to light, and of translating power from places where it is undesirable to use it, but where it can be cheaply procured, to places where wanted for use, and where it would be, if at all otherwise attainable, too costly.

Take, for instance, a dynamo located at a waterfall and using 100 horse-power, and giv-

Discovery of Californian Gold.

Address Delivered Before the Society of California Pioneers, Sept. 9, 1885, by John S. Hittell.

(Continued from last week.)

The opening of the mines proved disastrous to Sutter and Marshall, and was a subject of lamentation to both of them. The former did not know how to use his magnificent opportunity to make multitudinous millions. His land grant at Sacramento, through which all the travel and trade of the mines passed, and his possession of the only store there, his extensive acquaintance and his credit, gave him immense advantages over all competitors in the race for wealth; but he was not the man to make the best of them. He was careless, extravagant and confiding. He never thoroughly studied or diligently watched the details of any branch of his business. He gave his orders in vague language, and did not inquire whether they were clearly understood or promptly obeyed. His servants were employed without discrimination, and were not discharged when found remiss. Instead of employing one agent to sell his land at Sacramento, he had many, and some of them had instructions so injudicious that they were enabled to defraud him out of large sums. He trusted strangers readily and gave away much foolishly in the name of charity. So late as the fall of 1850, when employment could readily be obtained at high wages, a man representing himself to be a newly arrived and penniless immigrant could buy provisions, tools, and clothing from Sutter without security, and in many, perhaps most cases, the promissory note of the unknown purchaser was the only payment ever made.

The reports of the immense sums obtained by the miners induced Sutter to leave his store and go with a party of Indians to Weaver Creek, and thence to Sutter Creek, but this venture was doubly unprofitable, for he spent much, he got little gold, and his important interests at home were neglected. His flour-mill at Brighton was never completed, and all the money invested in it was totally lost to him. His injudicious sales, the frauds of his agents, the expenses incurred in resisting squatters, and the litigation to defend his title left little profit to him from his land; and a few years after the gold discovery he retired from business to a farm in Sutter county, a disappointed man, never ceasing to lament the gold discovery, which had deprived him of his dependents, his business, his land, his wealth, and his position as prince of the Sacramento valley. In consideration of his poverty and of his liberal aid to the American immigrants from 1843 to 1850, the Californian Legislatures of 1864, 1870 and 1874 gave him a pension of \$3000 a year for nine years, and would, perhaps, have continued it till the end of his life if he had not left the State in the vain hope of obtaining compensation from Congress for the wrongs done to him under the Congressional laws relative to Mexican land grants.

For a time Marshall seemed to be on the high road to fortune. His mill began to run in April, and although its operations were irregular at first, after a few months there was a steady demand for its lumber at \$500 a thousand feet, or twenty fold more than he had expected to receive. Many of the people in the mines and all the traders at New Helvetia, in the summer and fall of 1848 came to his mill, as the only one in the Sacramento basin, for sawn material of their houses, barns and fences. He continued to prosper until the spring of 1849, when a party of Oregonians killed—Marshall said—murdered—three aborigines near Coloma, and in retaliation five of their number were slain by the red men. The surviving Oregonians collected a mob and massacred all the Indians they could catch, including those employed at the saw-mill, though they had nothing to do with the previous trouble, and having come from the valley, were not of the same tribe with the mountain Indians. Marshall tried to save his red dependents, but the mob, not content with exterminating them, threatened him, and he was thankful to a friend who provided a horse for his escape.

On another occasion Marshall was driven from Coloma by a mob, and he said that his only offense was that he refused to tell them where they could find good diggings. When he went out prospecting he was watched as if he knew some wonderfully rich places, and on one occasion a multitude followed him, and when he stopped they threatened him with hanging if he held his knowledge from them. They were so furious that he fled on horseback, and remained away six months. When he returned he found his tools, his horses and his oxen had been stolen, his mill had gone to ruin, his title to his land about the mill was denied, a town had been laid out, and the lumbering business was at an end there for him. Sutter and he had paid the Coloma Indians for their land, and Marshall believed that under the American preemption law he was entitled to 160 acres of land, including all the valley in which the mill was situated, with its gold. The first miners did not dispute Marshall's title, and some of them paid for the privilege of washing gold on his land; but it was not long before lawyers came and explained that the pre-emption laws had not yet been extended to California and would probably never be applied to rich mining ground. Marshall was too obstinate to listen considerably to the other side, and he was too ignorant to fully understand that there was no

legal basis to his claim; and he firmly believed to the end of his life that great injustice had been done to him by the refusal of the authorities to drive off the trespassers. He could have obtained profitable employment as a carpenter, but he hoped for a sudden fortune at mining; and when he had a claim in which he could make an ounce a day he soon left it in the hope of finding one much richer, and thus wasted much of his time in prospecting. Though moderate in his wants and economical in his habits he never accumulated much money. His friends were few and poor like himself, so he could not engage in the large enterprises of fluming rivers or washing down deep gravel deposits in the hills. If he stuck long to a claim, it proved at last to be poor, while others above and below struck it rich. And he complained that if his labor promised to be remunerative he was driven away by ruffians and that this happened more than fifty times, but perhaps this was because presuming upon his imaginary pre-emption claim, he undertook to hold more ground than he was entitled to under the local customs.

Having made several statements discreditable to the miners at Coloma in 1849, on the authority of Marshall, it is only fair that I should add that, within the limits of my own observation on the overland route and in the mines, the pioneers of that year were the most orderly and peaceful men I ever saw, and I have lived in quiet towns in Pennsylvania and Ohio. The 25,000 adventurers who crossed the continent by way of the Platte and Humboldt valleys in 1849 nearly all started as soon as the grass furnished food for cattle, and all followed one narrow road. A thousand might sometimes be collected at a good camping place, and on the march we were continually making acquaintances. Some companies that were at first in front fell behind because they did not know how to manage their oxen; others with strong teams advanced from the rear to the front. The train to which I belonged kept a position near the middle all the way across, so that I had a good opportunity to see and speak with the emigrants. Their superior character was a subject of common remark and congratulation. All were agreed that no country had ever received a more desirable class of settlers. Many were well educated, and, though young, most of them had made a successful start in business. They were orderly, peaceful and well behaved. No case of drunkenness, gambling or fighting was reported in our vicinity between the Missouri and the Sacramento rivers, and I heard of only one homicide which occurred many miles away. I must admit that there was much profanity, but that in an ox teamster is an allotropic form of piety, and we all had to take our turns in driving. We were somewhat unenraptured, however, when the Indians, repeating the first words which they heard, and supposing them to be the ordinary salutations, would come up, hold out their hands and shout, "How d'ye do, Wo han, d— you!" sometimes adding a few words of similar import to show greater proficiency in politeness.

The men at Clear Creek, now Horsetown, near Shasta, where I spent the winter of 1849-50, had nearly all crossed the continent in the previous summer; and in the mines as on the road, their conduct was admirable. There was no homicide, no fighting, no quarrelling about claims, no gambling, no idling, very little intoxication, and no place within ten miles where strong liquor could be bought. Though gold dust was abundant, and was often seen lying about unguarded within sight of passing strangers, no thefts were reported until after midwinter, and then but few.

Marshall's assertion that he was driven from his claims more than 50 times by men whose only motive was robbery, suggests a suspicion of exaggeration, or of some fault on his part. The miners were always ready to defend a neighbor in the possession of his claim, held under the local customs and regularly worked; and this was so well understood that no trespasser would venture upon a claim unless he could make out a plausible case of abandonment or violation of custom.

It is not my desire to throw doubt on Marshall's honesty. That was never questioned among his intimate acquaintances, so far as I have heard. He had no desire to injure his neighbors, and was good and kind in all his impulses.

As to the character of the men of 1849, I speak not from hearsay, or from the hasty presumptions of a day or two, but from a year's direct and intimate observation of men thrown into new circumstances, exposed to many dangers, privations and temptations, and at the same time left without the wholesome checks of family, old associations, and well established legal machinery. Hundreds if not thousands of the overland pioneers of 1849, still surviving, can corroborate my statements as to the character of that migration. Of the miners at Clear Creek of the winter of 1849-50, the only one whose address is known to me is the Hon. Alexander Anderson, of Shasta, who was a member of the Second Constitutional Convention, and has filled other public offices with credit to himself and benefit to his constituents.

Marshall, to whom I must now return, took up some land near Coloma for agricultural purposes, about 1856, and planted kitchen vegetables, fruit trees and vines, which promised, at one time, to yield him a comfortable support, but the increasing supply of such things and the decrease of population in the mines deprived him of this hope, and mining again became his

reliance. He moved to Kelsey, four miles from Coloma, and there he made his home till the end of his days. In 1870 George F. Parsons, an able journalist of Sacramento, wrote Marshall's biography, and the work, though bearing the marks of hasty composition, is very readable. It had much influence in inducing the Legislatures of 1874 and 1876 to give an annual pension of \$1200 to Marshall for four years, making a total of \$4800, the only reward which he ever received from the public for his discovery. He died as he had lived, in poverty. Of the men who were at Coloma in January, 1848, not one became noted for wealth.

The Californian gold discovery is one of the most prominent events of recent times. To it can be traced many of the most beneficent features of recent progress. The migration of a million people from the eastern to the western side of the continent; the rise of large and highly civilized communities at the occidental base of the Sierra Nevada and Cascade mountains; the development of the wealth of California, with her cities, vineyards, orchards, factories and roads; the opening of the auriferous and argentiferous deposits of Australia, New Zealand, Nevada, Utah, Colorado, Montana, Arizona, Oregon, Idaho, and British Columbia; the construction of half a dozen railways connecting the two great oceans; the establishment of several steamer lines across the Pacific, and Japan's welcome to European intercourse, are only a few of its results. Industry and commerce first felt its powerful stimulus, and these reacted on popular education, political freedom, literature, science and art, all of which have made more rapid advances within the last 35 years than ever before, and largely because of the impetus started upon the bank of the American river.

The chief credit for the Californian gold discovery has been awarded by some writers to Sutter, through the influence of mistakes or prejudice. They had heard the Coloma mill spoken of as though it were Sutter's exclusive property. They supposed that Marshall was a hired servant, who furnished only his manual labor, while Sutter supplied the brains for the management, as well as the money. Besides, Sutter was a man whose munificent charities had placed the whole State under obligations to him; a man of family, of extensive friendship, of genial companionship, and of polished manner.

Marshall, on the other hand, had no family and few friends. He was rough in his mode of life, careless in his dress, often surly in his manners, and frequently querulous or extravagant in his conversation. Such comparisons of the two persons most prominently connected with the discovery, though they were not entitled to the least influence upon this question of the gold discovery, led many persons to assert that the chief credit belonged to Sutter.

The mill should have been called by Marshall's name. He selected the site for it, he built it, he was its sole manager, owning half the building, and having a superior claim to all the land. His industry and mechanical skill had a larger share in the enterprise than Sutter's money, and Sutter contributed nothing but money. He did not have energy enough to examine the place and form his own judgment about its fitness until the structure was nearly completed.

Marshall not only selected the mill site well, laid out the line of the race and superintended all the work, but he was the first to see the gold, to pick it up, to subject it to a test, and to recognize its value. The chief, if not the exclusive credit of the discovery belongs to him. To him more than to any other man, our State is indebted for the opening of those auriferous deposits which attracted to her a large population and suddenly gave her a secure and respectable position among the most highly civilized communities of our time.

An assertion printed in the *Alta Californian* of the 18th ult., that Wilfred Hudson found gold in the race, several days before Marshall saw it, is disproved by many evidences, the most conclusive of which is the fact that we have a list of all the persons at the mill at the time of the discovery, and Hudson's name is not there.

The credit belonging to Marshall is not of a high character. Though the results were marvellously great, the strike was purely accidental. When selecting the site for the mill and route for the race, he did not take into account the possibility of finding gold. When the metal was exposed to view he did not require much capacity to suspect its nature and to try whether it was malleable. He did not know enough to make a conclusive test of its value to find the extent of the deposit by prospecting, or to separate the gold from the gravel by washing. In the vastness and beneficence of its immediate consequences, his find may be compared with the discovery of America, and the inventions of the steam engine and the telegraphic alphabet, but his name will never be entitled to such honor in history as those of Columbus, Watt and Morse, who began their labors with grand purposes, and achieved success by means of learning, combined with rare foresight, steadfastness of purpose, long toil, and severe sacrifices, patiently borne in confident anticipation of a commensurate reward. Their triumphs were achieved by calculation, and Marshall's came by chance.

Did his luck place the community under great obligation to him? I think not. The sense of gratitude for favors conferred unintentionally is not strong in the average human mind. I do not recall a case in which a govern-

ment has given a large pension or fortune for accidental service. The noted liberality of California, however, would not have been withheld from Marshall upon any technicality about luck, if he had shown a disposition to receive favors gracefully. But he habitually spoke and acted as if he considered the world hostile to him. In his biography we are told that "the history of his life" after January 1848 is "a record of a series of outrages" including "persecution, robbery, abuse, slander, and injustice of the basest kind." Such a complaint must have had most of its basis in a diseased imagination. The people of Coloma and of El Dorado county generally entertained very kind feelings toward him, and regretted that he made himself so unhappy. His bitter feeling was shown in a letter refusing the request of Hutchings' Magazine in 1857 to allow his likeness to be used in illustrating an article on the gold discovery. He used these words: "I feel it a duty I owe to myself to retain my likeness, as it is, in fact, all I have that I can call my own, and I feel like any other poor wretch; I want something for myself. The sale of it may yet keep me from starving, or it may buy me a dose of medicine in sickness, or pay for the funeral of a dog, and such is all that I expect, judging by former kindness." This is from a man 45 years of age, strong, healthy and without a family, in a country where he could easily earn \$5 a day by his labor. There is some truth in Thackeray's statement, that "the world is a looking-glass, and gives back to every man the reflection of his own face." In October, 1848, he asserted that he had information of the existence of a large organized band of robbers at Coloma, that he understood their signals and knew several of the leaders, but when urged to give his information to the public, so that the offenders could be punished, he refused, on the ground that the criminals were too formidable, and the only result of his exposure would be that he would lose his life.

Soon afterwards, while in San Francisco, he discovered the plan of an organized band of robbers to burn and sack the city, and learned "their grips, passwords and counter-signs." He spoke to a friend of the proposed crime, but refused to go before the constituted authorities for fear they were in league with the criminals. We could believe one story of this kind, but two so near alike and so close together strain our credulity. Parsons admits the existence of a rumor that Marshall was insane, and in 1848 Major Reading thought his mind was unsound, an opinion evidently shared by Kemble. According to an opinion common among his neighbors, he was a crank. Notwithstanding his ill temper and his mental weaknesses, the Californians would probably have provided for him well if any comprehensive and judicious statement of his claims had ever been presented to the Legislature, but no such presentation was made. The citizens of the county where he resided never instructed their representatives to demand relief for him, nor did any Governor of the State plead his cause in an official document. While his treatment of the Government seems excusable, if not just, the people of the State will presumably regret to remote time that it was not more magnanimous. Expressions of such regret can avail nothing now to him, but they might be followed by giving some appropriate resting place and monument to his remains.

Many mistakes greater than the neglect of Marshall may be found in the history of California; and in this country, as in every other, the partial or malignant artist who depicts only the foul and overlooks the fair can paint a very black picture and truthfully assert that every separate feature in it is true to the life. The spoliation of the holders of Mexican land grants, the refusal to give permanent homes to the early settlers in the Sierra Nevada, the delay and chicanery in the administration of civil and criminal justice, the demagogism of the officials, and the embezzlements and frauds in the executive department, have been in some respects unequaled in any other highly civilized community. But the canvas on which these dark spots appear is bright in general color.

If we add together the number of inhabitants in California in 1850, 1860, 1870 and 1880, as ascertained by the census, and divide by four, we obtain 475,000 as the average population of the State for the last 35 years. No other people, within the same period after obtaining possession of a new and strange country, have done more in proportion to number to discover and develop its resources, or accomplish greater marvels in changing the face of nature. Within half a lifetime they have done more road-grading within the narrow limits of their territory than the Romans did in their entire empire in ten centuries, and Gibbon regarded the Romans as the most remarkable road-builders the world had ever seen. They have carried rivers over the hills and have dumped mountains into the valleys. They made their country as the *Westminster Review* truthfully remarked, first the treasury and then the garden of this world.

"But," says a Briton, reproachfully, "California has no traditions." A creditable tradition is not an appurtenance of real estate; it is personal property. It attaches itself to the man and not to the land. The Californians have inherited the history as well as the blood of their ancestors. Every great deed, every intellectual triumph of Europe or the United States belongs in part to them. A drop of Anglo-Saxon blood in California has just as much title in Rannymede as has any drop of

(Concluded on page 236.)

MECHANICAL PROGRESS.

Sparks by the Carload—Unconsumed Fuel.

Mr. John Bingley, master mechanic of the Hanover and Gettysburg railroad, writes to the *American Machinist* in favor of extended fire boxes as against extension smoke boxes, and also in favor of very large exhaust nozzles. He says:

"While on a trip over some of the trunk lines recently, and in speaking to a master mechanic about the working of extension smoke boxes, he said they were an expensive thing on freight engines, but the suburbs of our large cities ran out so far that they had to use them. But he remarked: 'We haul away 18 carloads a week of sparks, and that is most all fuel.' Eighteen carloads, at 20,000 pounds each, can easily be figured. I saw, recently, some one speaking of a certain extension smoke box, who said they emptied out, I think, 20 bushels in 15 miles. I have no desire to own an invention like that. No wonder railroads go into receivers' hands—rather costly, as the old lady said."

"Mr. Frank Smith spoke about railroads running less than 3" nozzles invariably coming to grief. He also spoke about back pressure in cylinders, etc. Very good logic, ell."

"But I conceive that the best extension is to be made on the fire box end, and it is only a matter of time when the master mechanics and purchasing agents will see it. This will give more thorough combustion, less smoke, no sparks. I say the proper place for sparks is in the fire box, where they belong. I know some parties use hoppers and steam jets to drive them back into the fire box, like the boy dragging his sled up the hill to skid down again."

The correspondent says that the road with which he is connected has given the idea a thorough trial. The fire box on one of their locomotives, with a heating surface of 1415 feet, was enlarged, and the single exhaust nozzle was enlarged from 5½ to 6½. In regard to the recent performance of that engine, Mr. Bingley says:

"I wonder if there is another locomotive in the United States with one larger than that? We haul freight, and sometimes large excursion trains, over pretty heavy grades to Gettysburg. This engine hauled President Cleveland and his company in grand style and time. The report from coal yard is that this engine heels the same trains with just half the coal the other engines do. We expect to save enough coal in one year to pay the royalty on the fire box. We are not bothered with sparks, black smoke scarcely any, steam always plenty. The fire men say it is a picnic to fire her, and they get sick sometimes when they have to change."

"Now I just state these facts to induce thought. Any man, who is not prejudiced, will do well to turn his thoughts of improvement to the other end of the engine. Engineers of an adjoining road look down the smokestack, some times, at the nozzle of the engine I refer to, then you should hear them—'bucket,' 'barrel,' 'hoghead,' etc."

CHROME IRON AND STEEL.—A boring tool of chrome steel, if properly proportioned, will stand to bore and turn cast-iron that is too obdurate to yield to the persuasions of the best tempered and "highest" crucible steel cemented from bars of the best iron. A large fly wheel for a special purpose, with a narrow rim, and thirty-two feet in diameter, was found to be so hard on the face of the rim that it could not be turned. Much fuss was made to induce the obdurate rim to yield, but to no purpose. Grinding was attempted, and chipping, but the outer surface was like glass. Tools of chrome steel finally induced the iron to yield, and a costly casting was saved. The chromate of iron, commonly called "chrome iron ore," is found in Maryland and in Pennsylvania. The chromate of potash is made by heating chrome iron ore with one-fourth its weight of nitrate of potash (niter) and then digesting it with water. Chromisen (chrome iron) is a compound of about three parts by weight of chromium and one of iron. It is hard enough to cut glass readily. Chrome steel has a large proportion of iron. Both are used in the construction of burglar-proof safes. Chrome steel may be made quite ductile and soft by using chromisen instead of spiegleisen in the Siemens steel process, when the resultant can be tempered to several grades of hardness within well defined limits. Chrome steel is useful for many jobs in the machine shop, and should be more generally employed.

THE PERFECTION OF MODERN TOOLS.—Smiles, in his "Iron Workers and Tool Makers," after referring to the fact that fifty years ago it was a matter of great difficulty to set a new steam engine to work, and to keep it going after it was started up, the foreman of the factory at which it was made having "almost to live beside the engine for a month or more," proceeds to speak as follows of the machinery of our day: "Now the case is altogether different. The perfection of modern machine tools is such that the utmost possible precision is secured, and the mechanical engineer can calculate to a degree of exactitude that does not admit of a deviation beyond a thousandth part of an inch. When the powerful oscillating engines of the Warrior were put on board that ship, the parts, consisting of some 5000 separate pieces,

were brought from the different workshops of the Messrs. Penn & Sons, where they had been made by workmen who knew not the places they were to occupy, and fitted together with such precision that so soon as the steam was raised and let into the cylinders the immense machine began as if to breathe and move like a living creature, stretching its huge arms like a new born giant; and then, after practising its strength a little, and proving its soundness in body and limb, it started off with the power of above a thousand horses to try its strength in breasting the billows of the North sea."

Second Hand Machinery.

There is no particular risk in buying second hand machinery and shop appliances, if such ordinary caution is used as would be deemed necessary in buying second hand furniture. If the seller is a man of known integrity, and is practical mechanic enough to understand not merely the market price, but the actual value of the machines, it is enough to trust to his representations. But it is not often that the practical or judging mechanic and the honest dealer are combined. Auction sales of machinery may be traps, unless the would-be purchaser has had previous opportunity to examine the goods. Second hand machinery is frequently offered for sale, not only cleaned of gurry and rust, but painted, varnished and polished. "Paint and putty cover a multitude of mechanical sins."

The times have put upon the market a large amount of machinery that has been used, much of it used up and fit only for the scrap heap. But the business necessities of some proprietors of small establishments have impelled the selling of shop tools and appliances at very low prices. There are plenty of good second hand tools in the market, as well as plenty of junk material.

If the purchaser is not himself a practical judge of the value of a machine, or a shop or factory appliance, it is not difficult to obtain, for a moderate consideration, the examination and opinion of a good mechanic. This will pay, even if the examiner makes a fair charge for time and trouble.

A small manufacturer wanted an additional boiler, and he bought a second hand one that had been coal tarred inside and out; it looked clean and shone beautifully. He bought it "dirt cheap," and had it put in place. It leaked like a sieve as soon as 60 pounds pressure was on; he had it calked on the seams, poured in a lot of rye flour; had the coal tar foaming over into his engine cylinder, and after three weeks of torment blew it off and had a reasonable boiler-maker examine it.

The result was patches and repairs to almost the first price paid; the combined expense would have bought a good boiler, and a small outlay for experience would have saved him a vexatious outlay of money and experience.

ALWAYS HAVE TOOLS HANDY AND READY FOR INSTANT USE.—It is impossible for a workman to keep every sort of a tool he may need, or have use for, among his kit of tools, if he has anything to do with repairing machinery or keeping it in order. If a machine is worth cleaning up it is worth having a few special tools fitted and kept where they will be handy for no other purpose than for adjusting and changing the parts of the machine. In the simple matter of helting the workman is obliged whenever one of these ripping connections becomes loose, or is torn apart from the lacing and gets wound about the shaft, to hunt over every department in his chest of tools for a piece of lacing he once saw, or among a hex of nails and screws, for a few belt hooks he may be in need of. It is very easy for any one to arrange a spare corner for a few lengths of lacing, belt punch, beltawl, with hooks or any other form of connection, and keep them where they will be ready at a moment's notice, instead of waiting until these simple tools are wanted for immediate use. One of the great advantages of helting never gearing is that a belt is very easily replaced, while a gear wheel would require the shutting down of the whole concern for the greater part of the day, and although a belt can be replaced or taken off and repaired in one-tenth of the time, nearly this amount of time is wasted by every one concerned in searching for one of these little articles for making belt holes, or for a side of leather to strip off a length of lace. It is very true that an accident by which a belt gives out, if it can be called an accident, does not occur every day, but it is all the more reason that the necessary tools and material to work with should be protected with as much care as the work they are to assist, for it is during these idle moments that they are likely to get misplaced. In looking after the welfare of any machine, or the amount of production expected from any tool, as much depends on the means of adjusting as in any part of its operation.—*Am. Artisan.*

THE DAYS OF MACHINERY, remarks a contemporary, have been for the poor man days of home-making and home-making comforts, as no other days ever were. If machinery has given the rich man luxury, it has given the poor man the necessities and comforts of habitation, and clothing, and travel, such as he never had before. The printing press, especially, is the poor man's servant and benefactor, soothing abroad our intellectual wealth, raising all to an intellectual level and binding all into one whole.

SCIENTIFIC PROGRESS.

Formation of Artificial Petroleum.

Possible Origin of Natural Petroleum.

For the past quarter of a century, ever in fact, since the attention of the commercial and scientific world was attracted to petroleum by reason of its immense production in Western Pennsylvania, its primary origin has been a question of much study and speculation.

The question was asked over and over again: What is petroleum, and how were the immense deposits formed, and from what substance or combination of substances?

Some scientists ascribe its formation to the result of vegetable decomposition, but other scientists soon proved the vegetable theory fallacious. Then the theory was advanced that it was formed by the decomposition of animal matter, but this theory was also shown to be wrong.

For a long time the apparent impossibility of solving the problem seemed to discourage scientists, the discussions on the subject ceased and the public lost sight of the matter and but little appeared in print about it.

Later on, and quite recently, the question of the origin of petroleum again began to be discussed, more particularly among strictly scientific scholars, and among them M. Berthelot, of Paris, who carefully studied the chemical composition of petroleum, and when he had satisfied himself on this point he began experimenting, endeavoring to make petroleum or a substance that had the same chemical constituents as petroleum. This he finally accomplished and a result has arrived at what may be the correct theory of the cause and source of the origin of petroleum.

By the action of superheated steam on cast-iron, that was exceedingly rich in carbon, in a fluid state at a very high temperature, a product was produced which after a careful investigation was found to be identical with the hydrocarbons forming crude petroleum. This discovery not only offered a hypothetical theory of the formation of petroleum but very possibly explains the nature and origin of its formation at great depths in the interior of the earth.

The way in which nature, in her great laboratory may form petroleum is easily comprehended and understood when a few well-known philosophical and chemical facts are considered.

It is a demonstrable fact that the specific gravity of constituents in the interior of the earth greatly increases as the center is approached and that at a great depth there is a vast accumulation of the heavier metals; and it is also generally acknowledged that the heat of the interior of the earth so increases as the center is approached that at great depths it is hot beyond any artificial heat that man can create on the earth's surface. It is also proven by experience that iron, at a very high temperature and under great pressure, is able to absorb much larger percentages of carbon than the cast-iron in blast furnaces.

It is also known that through fissures in the ocean bed water filters to very great depths, where the heat is excessive and where iron would be in a melted condition and under a great pressure. Here, then, are the necessary conditions to produce the same results as were produced in the laboratory of M. Berthelot.

The chemical action which produces the petroleum is as follows:

The sea water coming into these very hot depths is converted into superheated steam, which, coming in contact with the melted iron, rich in carbon, is decomposed into free hydrogen and oxygen. The oxygen combines with the iron to form iron oxide and the hydrogen unites with the carbon, which was set free through the oxidation process—thus forming the hydrocarbons. These hydrocarbons consist of gas, vapor and oils, which, in the intensely hot regions where they are formed, are in a vaporous state. These vapors, ascending through fissures to a higher and cooler region, will, by condensation, deposit all their condensable products upon reaching a strata of porous rock able to absorb the liquefied oil, and over which there is an impervious strata to prevent their further ascending. The result of these condensed liquefied products is petroleum, or rock oil, as found in the so-called oil-bearing rock.

It may be asked why, if the above be true, that petroleum is not found in all parts of the world, and why, when found in a strata of rock at one place it is not sometimes only a short distance away. The shortest answer would be that the combination of the several necessary conditions for not only its formation but condensation and deposit did not exist in those places where it is not found. It must be remembered that not only must the hydrocarbon vapors be found in the interior, but there must be fissures in the various sub-strata through which the vapors come up toward the surface, and that these fissures do not exist in all places. Further, even, when the vapors do ascend, condense and form petroleum in deposit, the vapors must find their way to a strata of rock sufficiently porous to absorb and hold the condensed products, and that to condense the vapors these strata of rock must be sufficiently near the surface to be cool enough to cause the necessary condensation. And, again, that such strata of rock must be overlaid with a shell or crust or strata that is impervious to the ascending vapors, otherwise they will continue to ascend to the surface, and instead of condensing escape and pass off into the air in a gaseous or

vaporous state, as is frequently the case in many parts of the world where there exist gas springs, so called.—*Exchange.*

Causes of Earthquakes.

Colonel W. W. Hollister, of Santa Barbara, has been for thirty years an interested observer of the results and phenomena of earthquakes. His conclusions as to their causes are so diverse from the usually accepted theories of their causes that they will be of interest to many readers. His theory is that electricity is the force to which is attributable the disturbance of all seismic areas; that great reservoirs of this fluid are formed, the overflow of which acts with such tremendous power and quickness as to suspend the principle of gravity. He has remarked that the mid-action is generally a straight line, which is occasioned by the negative and positive poles meeting in one uniform center. In support of his theory and in opposition to the old one, which is based on the sudden generation of steam from the influx of superficial water to internal fires, he adduces the testimony of many who have been in wells or mines at the time of an earthquake and observed no motion, while the immediate surface has been greatly agitated. He divides them into two kinds as to motion; the one traveling as a wave at sea, and the other in a right line. The amount of liberated electricity would control the intensity of the shock. In support of his theory, he also alleges that if the earth's crust were rendered from below, springs which have been released would flow downward into the ruptures opened, instead of remaining living springs upon the surface. Earthquakes, he says, are exterior, not interior; otherwise, there would be a continuous great chasm to the very center. That gravity is, then, overcome or suspended, he contends to be proven by the fact that stone walls, chimneys and persons have been removed from locations as though undisturbed by levitation. He has seen water two inches deep in a tub rise and overflow its sides when the motion of the earth was not sufficient to account for such an eccentricity. The greater frequency of earthquakes in the vicinity of volcanoes he ascribes to the necessarily thinner crust of the earth's surface near them, therefore rendering it more susceptible to fracture, which occasions the rushing fourth of the lava, "because of the suspension of the force of gravity." Colonel Hollister offers his theory suggestively, and hopes it may promote a discussion which will ultimate in scientific observations and discoveries.

The Art of Printing.

We may trace the footprints of creation in the enduring rocks that underline the earth's surface. The physical world bears the imprints of the Almighty Hand by which it was created, and reading this wondrous page in the light of modern science, curious inquiry is ever encouraged by new discovery to fresh research. Even the birth of man, and the manner of his coming into this world of ours as an animal, is now a problem of which many claim to hold the key. They can even speculate shrewdly as to when this animal became the proud possessor of that intelligence which distinguishes him from his humbler fellow creature—when man began to think.

But there is a point in the world's history from which we may reason with a proximate certitude. Beyond and back of that all is confusion, doubt and superstition. Tradition, which transmits its facts by impression upon the shifting tablets of memory; the spoken word that fades into silence or is lost in the confused babel of tongues, that loses its import on being repeated, is not a trustworthy guide by which to trace the growth of thought.

When men began to write, though for the first time began to assume an enduring form. Then books were made, and the mental achievements of one age were handed down as a legacy to the next.

And even the written page, whose words were traced "in the unvoiced silence of the student's cell," to be read only by the unquestioning disciple whose highest aspirations were to understand the dicta of the sage, whose prodigious wisdom was taken for granted, proved but a halting advance in the world's mental progress. Not until the art of multiplying books by impressions from movable types was discovered, was human thought emancipated for all time. Its first charter of inalienable liberty was the printed page. Books, open to criticism, capable of countless reproduction, render the mental labors of one century as legible to future generations as they were to the age in which they were first given to the world. They live with their truths side by side with their errors. They endure as records of past achievement, and the prophecies are subjected to the test of the world's riper experience. To destroy the results of this wondrous invention, it would not suffice to burn all the great libraries of the world. Nothing less than a flame that would wrap the earth could undo the work of movable types or blot out the records of human progress.—*The Printer.*

The manufacture of solid carbonic acid gas has been carried on for some time in Berlin. It comes in small cylinders, and if kept under pressure will last some time. A cylinder 1½ inches in diameter and 2 inches long will take five hours to melt away into gas.

Passing Events.

We devote considerable space in this number of the PRESS to the list of awards to exhibitors at the Mechanics' Fair in this city, which has just closed. The list is instructive, as showing the variety of our local industries, and is useful as well in indicating as it does, the question of superiority in various branches.

The discovery of gold in the French possessions in Madagascar is announced. Thus far there are no details at hand to indicate the extent or value of the fields.

It is said that the famous State Line mines, on the borders of California and Nevada, about which there was so much talk some years since, will soon be started up again.

The low stage of water in many of our California rivers is being taken advantage of by river-bed miners, who are doing well in this branch of mining. With the first rise in the water, however, their work will come to a stop.

The Manufacturers' Association held an important meeting at the Mechanics' Institute on Wednesday evening. Owing to the fact that the list of awards of the fair takes up so much space in this number, our report of the Manufacturers' Association meeting is necessarily deferred to the next issue of the PRESS.

The Bald Mountain Extension Co., Forest City, Sierra county, cleaned up last week 153 ounces of gold, valued at \$2,845.80, the gravel averaging over \$3 per carload from sides of channel. The width of pay lead is 168 feet, and no left rim has yet been found.

MINING companies having offices in this city disbursed in September \$244,200 in dividends.

Ore Assays.

The Mint Bureau has issued a circular discontinuing the assaying and chemical analysis of ores and of furnaces by-products at the mints and assay offices of the United States. It is ordered that the mechanical preparation of pulverizing of ores or other mineral, mattes and slags, shall be done upon the premises of the mints and assay offices only when a part of the technical processes of these institutions, or when in the course of their regular business. The Director also adopts a rule to the effect that assaying or chemical work in a private professional capacity at the hands of offices of the United States mints and assay officers, should not be performed upon the premises of these institutions. Professional signs are prohibited upon the premises of mints and assay offices; and it is ordered that professional cards and certificates of assay or analysis must be without official captions or signatures.

There has been complaint from private assayers that the Government has been doing work in competition with them. It is not long since the Government reduced the prices of assays from \$3 to \$2 for gold and silver, and from \$5 to \$1.50 for copper. But now these officials cannot do it at any price.

The order will be mainly felt by prospectors and miners in Idaho and Montana. At Boise and Helena the Government assay offices have been doing considerable business for some time. The Idaho men will have to send to Portland, Salt Lake, or this city, if they wish certificates from large establishments. There are now, however, many private assaying establishments all over the country, where good work can be done. Ore assays are so simple and so quickly performed that the order can work little hardship generally, though in some few cases it may put men to more trouble than they have been accustomed. Any reliable assayer can make just as good ore assays as Government officials.

Sediment and Fissures.

In some mining districts transported material or sediment is often an accompaniment of fissures and ore bodies. In Eureka district it consists of loose boulders of gravel more or less connected together, of large and small brecciated fragments of limestone or of loose sand. The nature, the position it occupies and its structure, show that it could only have been brought into its present place by the aid of water. It is to be looked upon, therefore, in the opinion of Mr. J. S. Curtis, as simply a wash from higher points which has filled the cavities and interstices of the rock formed by dynamic and chemical causes. This wash frequently accompanies large ore bodies and is usually found adjoining or overlying the ore, and although it is not an infallible indication of its presence, it is one which is not to be overlooked. The two-million-dollar ore chamber on the eighth level of the Eureka mine, Eureka district, Nev., was discovered by following such a wash. This body extended up above the seventh level, and down nearly to the ninth, and covered a great deal of ground with its ramifications and pipes. On the other hand, there is a very large mass of material of similar origin, in the form of fine sand, on the fifth level of the Phoenix, which, although pretty well prospected, has not led to any discoveries. These washes are more frequent at or near the surface, but have been found down almost to the water-level.

Avoidance of Brittle Gold.

Most gold and silver refineries in which the method of parting by sulphuric acid is adopted, produce brittle gold—that is, gold that cannot be rolled safely, and which requires careful annealing before passing the breaking-down rolls, and perhaps may not be sufficiently ductile even after annealing. Much trouble has been experienced at the San Francisco mint from this cause. The presence of the most minute quantity of lead impairs the ductility of gold, but does not affect silver in nearly the same degree. Lead is with difficulty removed when the parting of gold from silver is done by sulphuric acid. To entirely eliminate the lead which may be present, a very simple and efficacious expedient has been devised, which consists in taking advantage of the difference in specific gravity between gold and lead and the minute subdivision of the particles of the latter. The

filtering vessel in which the parted gold is washed with hot water, is slightly inclined by the operator, and the lead particles are floated off with the washings into another tub. This plan of simple decantation succeeds so well that at the Carson mint, according to Williams, the gold ingots do not require to be annealed before going to the breaking-down rolls.

More Gold Fields.

The Chinese, having recently found gold in their territory bordering on the Amoor river, have put several thousand men at work on the new diggings. Now comes the news that the French have discovered gold in paying quantities in Madagascar. No special sensation has been caused by the latter announcement, though some \$7000 or \$8000 has been received as the first results of the discovery. The gold is in the mountains which lie in the territory of the Hovas, with whom the French are carrying on a sort of a skirmishing war, which, however, will no doubt be soon put an end to if the gold discoveries are as extensive as supposed.

The Island of Madagascar is the third largest in the world, being 980 miles long from north to south, and 350 miles across its widest part. It is in the Indian ocean, and about 300 miles from the southeast coast of the African continent, from which it is separated by Mozambique channel. The country is still but imperfectly explored. The country is pretty well watered, even in the highest ranges of the interior, the abundant rainfall giving a perennial supply to the innumerable springs and streams.

The geology of Madagascar has been imperfectly investigated. Still it has been found that iron exists in great abundance in the central parts of the island, and copper and silver are said to have been found in small quantities, but are not worked. Antimony seems to be plentiful in the north, and rock salt, iron pyrites, plumbago, and various others are among the mineral products. There are thin beds of lignite, suitable for steam coal, on its northwest coast.

The Hova, is the dominant tribe, and occupies the central province of Imerina. They are the most advanced, intelligent and civilized of all the Malagassy. The new gold fields are in their territory. This is the only place owned by the French people where gold has been found, and its occurrence is likely to excite the French to a wonderful degree. It is yet too soon to speak definitely of the extent or value of the discovery.

Expanding Drill-Bit for Boring.

In artesian well boring the drill-bit is passed down on the inside of the pipe until its cutting points or ends project below the pipe. The drill is then rotated by suitable mechanism, and as it makes its hole the pipe is forced down after it. In ordinary drill-bits it is obvious that as they are no wider than the interior diameter of the pipe, the hole made by them is also of that size, and therefore the pipe, which for the space it occupies is measured by its exterior diameter, has to be forced down a hole too small for it. To obviate this difficulty extensive or expansive drill-bits have been attempted. These are adapted to pass down through the pipe in a contracted condition, and when they get beyond the pipe, they expand or extend in order to cut a hole larger than the pipe itself, but it is obvious that the friction of the descending drill-bit against the interior wall of the pipe as it is being lowered is materially increased by the fact that it is being held in a contracted condition, merely by reason of its confinement within the pipe.

Mr. Charles C. Lane, of this city, has just patented through the MINING AND SCIENTIFIC PRESS Patent Agency, a new form of expanding or extension drill-bit, specially adapted for boring artesian wells. The invention consists in two or more spring legs firmly secured at their tops to the head of the tire, their lower ends being formed into or provided with cutters, above which, on their outer edges, are formed peculiar frictional or bearing-knees on fixed or stationary fulcrum blocks between the legs, over which they are adapted to bend when their lower ends are forced together, whereby the distance between the cutters is much shorter than the distance between the knees; and in a vertically adjustable automatic strut-brace adapted to operate between the legs to hold them rigidly separated, and to re-

lease them when the tool has to be raised. The invention consists, further, in providing in some cases anti-friction rollers for the knees and a clamping band for the cutters.

Mining Debris.

They are getting up a sort of debris scare in Oregon, the Portland *Oregonian* having published an article, trying to prove that hydraulic mining in Boise county, Idaho, is filling up the Columbia river and will impede navigation. They are looking a long way ahead, when it is remembered that the Boise basin is 750 miles above Portland, and no debris is deposited in the Boise river, 30 miles below, where mining operations have been carried on for 20 years. The Idaho *Statesman* gives two reasons for this: "Moore's creek, where the debris is deposited, is a deep, rocky canyon for 30 miles, and takes it as fast as it is washed down. Of course the water riles the waters of Boise river and partially riles the waters of Snake river for about 100 miles, but there is scarcely any perceptible coloring of the waters of Snake river at Lewiston, although Salmon river, where there is considerable hydraulic mining, empties in 50 miles above Lewiston, but the waters of Payette, Owyhee, Malheur, Weiser and Grand Ronde rivers are all heavy streams of clear water, and help to cleanse the waters of Snake river long before it reaches the Columbia. If these tributaries were like the Platte, the Niobrara, the Yellowstone and numerous other branches that roll down their sands to help perturb the muddy waters of the Missouri, there might be cause of danger. Portland is on the Willamette, 20 miles above the mouth where it empties into the Columbia, and any careful observer will discover that the mud and dirty water that flows down the Willamette in consequence of plowing and cultivating the soil in the valley above, and the great rains and freshets which the country is subject to, is a hundred-fold greater than the muddy water from the mouth of Snake river, which is nearly 300 miles above the mouth of the Willamette. All the danger of debris filling up of the Columbia is in what is known as the Lower Columbia, and that comes from the cultivation of the soil on the streams below the Cascade range during the rainy seasons. If there was any trouble about the debris in Boise county, Boise valley would suffer first. No inconvenience has ever been experienced in this valley. If there were ten times more mining in Boise county the debris could be cribbed or caught in the Moore's creek canyon with very little expense."

While this agitation is commencing in Oregon, the expected results of the famous Sawyer decision are being felt here in this State in the increasing number of injunctions against hydraulic mines. An action has been commenced by the Board of Supervisors of Sacramento county against all the hydraulic mines ascertained to have been lately in operation on the Cosumnes river. The suit is entitled George Cashman vs. the Amador and Sacramento Canal Company. Cashman alleges that he is the owner of a ranch of 700 acres on the north bank of the Cosumnes, twelve miles above its mouth. He complains that, owing to the hydraulic mining carried on by defendants in Amador, Sacramento and El Dorado counties, a large quantity of debris, consisting of sand, red earth, gravel and cobble-stones, equal to about 300,000 cubic yards, is annually being deposited in the Cosumnes and other rivers. He further alleges that, owing to the blocking up of the channel of the river, the water has been forced upon his bottom lands, the crops destroyed and the land left covered with sand, from which worthless willows readily spring and render it perfectly useless. He asks that the defendants be enjoined from operating the mines.

Judge Sawyer, of the Circuit Court, has granted a temporary injunction against all of the mines on the Cosumnes, and they have all ceased operating. Service has been made upon the Amador and Sacramento Canal Company, H. S. Bynan, John D. Hurley, John Haggerty and Martin Welch, connected with the mines at Hill Top, Lambing Bros., Geo. W. Phillips and others at Irish Hill, etc. The case will be heard before Judge Sawyer, November 2d.

The San Francisco mint coined \$1,920,000 during September, of which \$1,120,000 was in ten dollar pieces, and the balance in twenties.

(Concluded on Page 237.)

PRACTICAL HYDRAULICS.³¹

NUMBER 4.

PRINCIPLES OF HYDRAULICS.

[Written for MINING AND SCIENTIFIC PRESS by P. M. RANDAL.]
[COPYRIGHTED.]Substituting these values of pc and $(2g)^{\frac{1}{2}}$ in (34).

$$Q = 2.6365 h^{\frac{5}{2}} \text{ per second.} \quad (35)$$

If, in (35), h'' representing inches be substituted for h , which represents feet, and the unit of time be made one minute, we shall have the following formula, which is attributed to Professor James Thompson, of Glasgow University:

$$Q = 0.317 h''^{\frac{5}{2}} \text{ per minute.} \quad (36)$$

If a second be the unit of time, and the head be in inches, we have:

$$Q = .005285 h''^{\frac{5}{2}} \text{ per second.} \quad (37)$$

Professor Thompson having experimented satisfactorily with the quadrantal weir, pronounces it more simple and reliable than the rectangular weir, in that the ratio between the head of water and the horizontal width of notch is constant; in that the flow of water through it is less effected by the "depth from the crest to the bottom of the channel of approach," and finally, in that the coefficient of discharge is constant for different depths. In the experiments of Prof. Thompson, "the volumes of water," says J. T. Fanning, C. E., "varied from .033 to .6 cubic feet per second." From this statement it is deducible that the depths of water varied from two inches to 6.6 inches (see Table 4), though the depths given by Mr. Fanning vary from two to four inches.

The simplicity of this weir, its cheapness, and the assurances of its superiority, as stated, have induced the computation of Table 4 for practical use.

				47.		80.0420	

Table 4 has been computed from formula (37), in which the head is in inches, and the quantity discharged per second is in cubic feet. The tabulated discharges for depths of water over six inches requires the confirmation of experiment; until that shall be had, however, there seems good reason from the data to regard them approximately correct.

APPLICATION OF TABLE 4.

Ex. 20.—The depth of water in a quadrantal weir being 2.1 inches, what is the discharge over it in cubic feet per second?

Cal.—In "head" column, Table 4, find the given head 2.1 inches, opposite which, in "flow" column, will be found .0338 cubic feet: the quantity sought.

To determine the flow of water on a quadrantal weir, the head given being equal to the product of two factors, each designating a head of water in Table 4.

Rule 14.—Multiply the product of the discharges due the factor heads by 189.2.

Ex. 21.—The head in a quadrantal weir being 15 inches, what is the discharge per second?

Cal.—Observe that the factors of the given head are three and five: $3 \times 5 = 15$.

By Table 4, flow due 5" head = .2954.

By Table 4, flow due 3" head = .0824.

Hence, $.2954 \times .0824 \times 189.2 = 4.6054$ cubic feet.—*Ans.*

Ex. 22.—The head in a quadrantal weir being 42 inches, what is the discharge per second?

Cal.—Observe that the factors of the given head are six and seven: $6 \times 7 = 42$ inches.

By Table 4, flow due 6" head = .4661.

By Table 4, flow due 7" head = .6852.

Hence, $.4661 \times .6852 \times 189.2 = 60.4258$ cubic feet.—*Ans.*

The application of Rule 14 to depths below 13 inches will be unnecessary; the rule is given to avoid an extended table.

EQUILATERAL WEIR.

To determine the flow of water over an equilateral weir, ECF, in Figure 3, make $p = \frac{2}{\sqrt{3}}$. That is when

h is the height of an equilateral triangle, its side on width as in ECF, is $EF = ph = \frac{2h}{\sqrt{3}}$. Substituting this value of p in Eq. (33), there results:

$$Q = 1.52217 h^{\frac{5}{2}} \text{ per second.} \quad (38)$$

Were the head given in inches, and the quantity of flow required in cubic feet per minute, then would

$$Q = 1.77 h''^{\frac{5}{2}} \text{ per minute.} \quad (39)$$

The heads being equal in the two forms of triangular weirs, thus far considered, then will the discharge in the equilateral form be to the discharge in the quadrantal form as .57735 is to 1. Hence, to find by Table 4, the discharge over an equilateral weir, the head being given:

Rule 15.—Find in Table 4 the discharge due the given head over a quadrantal weir. Multiply the quantity so found by .57735.

Ex. 23.—The head of water in an equilateral weir is eight inches. What is the discharge in cubic feet per second?

Cal.—By Table 4, it is seen that the "flow" due the given head, eight inches, is .9567 cubic feet per second. Hence, $.9567 \times .57735 = .5524$ cubic feet.—*Ans.*

In Eq. (34) any value may be given p , as 1, 2, 3, 4, 5, etc., so as to indicate the relations existing between the height and width of triangular weirs. But since c , the coefficient of discharge, varies with every different condition imposed, the labor of determining the theoretical flow due any considerable number of such forms would necessarily be barren of practical results.

In general let (34) be reduced to its simplest form:

$$Q = 2.14 pc h^{\frac{5}{2}} \quad (40)$$

In which h denotes feet, and Q cubic feet.

If in (40) we make $p = 2$ and $c = .616$, the formula becomes that of the quadrantal weir, as shown by Eq. (35).

If we make $p = \frac{2}{\sqrt{3}} = 1.1547$, and $c = .616$, the formula becomes that of the equilateral weir, as shown by eq. 38.

If we make $p = 2\sqrt{3} = 3.4641$, and $c = .616$, the formula becomes that of a weir, whose apex or angle $C = 120^\circ$; Fig. 3.

$$Q = 4.5665 h^{\frac{5}{2}} \quad (41)$$

And in this manner may special formulas be deducted from (40), to meet the various requirements of triangular weirs. In theory the results obtained are as they should be; but in fact, experiment best determines in what cases c is constant, and in what variable.

TRAPEZOIDAL WEIRS.

To determine the flow of water over a trapezoidal weir. Let, in Fig. 3, ACD represent a triangular weir, in which GI is a line indicating a division with respect to flow of water over the weir.

The flow of the triangular portion, GCI, taken from the entire flow due ACD, there remains that portion of the flow due the trapezoid DAGI. The mean velocity of the water in ACD is evidently greater than the mean velocity is in DAGI, else the flow in the trapezoid could readily be determined from that of ACD by the simple ratio of three arms.

Let, in the present solution, h , p , c , Q , g and v have the same values or functions which they had in the discussion hitherto of triangular weirs. In addition put $CL = nh$;

$$\text{Then } BL = (1-n) h, \quad (42)$$

the depth of the trapezoid DAGI.

Integrating equation (33) between the limits of $x = 0$ and $x = nh$, and there results the flow per second due the triangular portion of the weir GCI.

$$Q_i = pc (2g)^{\frac{1}{2}} \left(-\frac{2}{3} (1-n)^{\frac{3}{2}} + \frac{2}{3} (1-n)^{\frac{5}{2}} + \frac{4}{15} \right) h^{\frac{5}{2}} \quad (43)$$

Deducting (43) from (34), there remains:

$$Q = \frac{2}{3} pc (2g)^{\frac{1}{2}} (2+3n) (1-n)^{\frac{3}{2}} h^{\frac{5}{2}}. \quad (44)$$

Formula (44) represents the discharge due the trapezoid DAGI.

$$Q = 1.07 pc (2+3n) (1-n)^{\frac{3}{2}} h^{\frac{5}{2}}. \quad (44)$$

Ex. 24.—The width of a trapezoidal weir being two feet, the depth one-fourth ($\frac{1}{4}$) of a foot, the sides inclining 45° to the horizon, and the coefficient of discharge being .62, required the cubic feet flow over it per second?

Cal.—Since the width is two feet, and the inclination of the sides 45° , were the sides produced downward till they meet, the depth of the triangle so formed would be equal to one-half the given width—that is, $h = 1$ foot, and $p = 2$.

The given depth of weir being $\frac{1}{4}$, hence $n = \frac{1}{4} (1 - \frac{1}{4}) = \frac{3}{4}$.

Making substitution of these values in (44),

$$2 + 3 \times \frac{3}{4} = 4.25;$$

$$(1 - \frac{3}{4})^{\frac{3}{2}} = \frac{1}{8};$$

$$(1)^{\frac{5}{2}} = 1. \text{ We have}$$

$$Q = 1.07 \times 2 \times .62 \times 4.25 \times \frac{1}{8} = 7.05 \text{ cubic feet.} \text{—Ans.}$$

Ex. 25.—The width of a trapezoidal weir being 4.5 feet, the depth one foot, the sides inclining 45° to the horizon, and the coefficient of discharge being .62, required the cubic feet flow over it per second.

Cal. 1st.—The width being 4.5 feet, and the inclination of the sides 45° , if the sides be produced till they meet, the depth of the triangle so formed will be $2.25 = \frac{3}{4}$ feet.

$$2.25 - 1 = 1.25; n = \frac{1}{2} \times \frac{2.25}{2.25} = \frac{1}{2}; 1 - n = 1 - \frac{1}{2} = \frac{1}{2}; p = 2.$$

Substituting these values in Formula (44),

$$Q = 1.07 \times 2 \times .62 \left(2 + \frac{1}{2} \right) \left(\frac{1}{2} \right)^{\frac{3}{2}} \left(\frac{1}{2} \right)^{\frac{5}{2}} = 10.946 \text{ cubic feet.} \text{—Ans.}$$

Cal. 2d.—The bottom width $1.25 \times 2 = 2.5$ feet.

Regard the trapezoid weir made up of a rectangular weir, whose length is 2.5 feet and depth one foot, and of a quadrantal weir, whose width is two feet and depth one foot. Then

The quantities of "flow" are found to be by Table 2, for each linear foot of crest, 3.339 cubic feet; hence, for 2.5 feet; $3.339 \times 2.5 = 8.3475$ cubic feet, and by Table 4, for "flow" over a quadrantal weir one foot deep = 2.6365 cubic feet.

$$\text{Hence, } 8.3475 + 2.6365 = 10.984 \text{ cubic feet.} \text{—Ans.}$$

The discrepancy between the results obtained by the 1st and 2d calculations arises from the different values assigned the coefficient of discharge.

By *Cal. 1st* the coefficient was taken, as proposed in the given problem, at .62.

By *Cal. 2d*, the coefficient employed in computing Table 2, was taken from Table 1, which will be seen to be 3.339. So that the coefficient of discharge employed in Table 2, was, in fact, $3.39 \div \frac{2}{3} (8.025) = .6241$, instead of .62, as provided in the given proposition. The coefficient of discharge employed in computing Table 4, was .616, which was deduced from the formula given by Prof. Thompson. Weisbach's Mechanics and Engineering state that the coefficient employed by Prof. Thompson, was .619, while J. W. Stone, C. E., author of Hydraulic Formula, states that it was .617.

Cal. 3d.—The top width is given 4.5 feet. The bottom width = $(2.25 - 1) \times 2 = 2.5$ feet. Mean width $(4.5 + 2.5) \div 2 = 3.5$ feet.

By Franeis' formula $(3.5 - 1 \times 2 \times 1) = 3.3$, corrected length.

By Table 2, flow over each linear foot, 3.339 cubic feet. Hence, $3.339 \times 3.3 = 11.008$ cubic feet.—*Ans.*

This result differs but little from those obtained from more rigorous solutions.

FLOW OF WATER OVER TRAPEZOIDAL WEIRS IN WHICH THE LENGTH OF THE CREST IS GREATER THAN THE TOP WIDTH OF THE NOTCH.

FIG. 4.

Let ABCD, Fig. 4, represent a trapezoidal weir, in which the length of the crest $AB = b$ is greater than the width of the water surface $CD = t$.

ENGINEERING NOTES.

THE WORK OF THE ENGINEER has been defined as the overcoming of the resistances of nature, and the best engineer is he who effectually overcomes these resistances with the least expenditure of time, labor and money. The successful engineer must love his work for its own sake, and not for its emoluments. He must have the same professional pride that a good lawyer or doctor has, and be ready to sacrifice his money, fame, or even life itself, if duty should demand it. The responsibility thrown upon the engineer is sometimes one whose extent cannot be measured by a money standard. His mistakes may be more serious than those which hurt only the pockets of the lawyer's client, or those which the doctor brings six feet under ground. Think of the mistakes of the Ashtabula bridge, the engineer of which committed suicide; of the Tay bridge, the disaster to which is said to have broken the heart of its builder. And as to the financial responsibility, how many millions of dollars have been lost by engineering mistakes. See the abandoned mines and mills in our gold and silver districts, the silent blast furnaces and rolling mills built in the wrong locations, the waste of money and life in the Hudson river tunnel and the Panama canal. No higher trusts are assumed by any other profession than by that of engineering. It behooves that profession, therefore, as much as any other to be sensitive of its honor. Shall a judge be corrupt, or a lawyer defraud his title? No more should an engineer give or take a bribe, or do ought to bring dishonor on himself, or to demoralize his associates. In manners he should be beyond reproach, but in integrity beyond suspicion.—*Wm. Kent, M. E.*

SOME BIG SCHEMES.—In the development of railway schemes the present age is most prolific. Two of these are of colonial inception and of great magnitude—namely, the Canadian Pacific Railway from sea to sea of North America, and the Australian Transcontinental Line, which is intended ultimately to connect Adelaide in the south with Port Darwin in the north. Yet there is nothing startling about these projects, because they are in familiar fields of enterprise and expansion, and because they seem not merely legitimate, but obviously necessary sooner or later. Of vast importance to the British Empire, again, is the intention to expend some £50,000,000 in developing the railway system of India. It is known that a very large portion of the wheat actually produced in India is wasted, because of the insufficiency of existing means of getting it to market. It is also known, by the careful reports of experts, that vast tracts which are peculiarly adapted to wheat cultivation are now lying useless, and that, although the present production of wheat in the Empire is between two hundred million and two hundred and forty million bushels annually, it could be almost immediately doubled were communication established. With an adequate development of the railway system, it is probable that India may vie with America as the granary of the world.—*Chambers' Journal.*

ARTIFICIAL WATER-WAYS.—The Chicago *Times* is of the opinion that the time for building canals has gone by; that they are relics of a past age, and have been, or will be, entirely superseded by railroads. In England the Manchester ship canal bill has just passed through both houses of Parliament. The original estimates for completing the canal were something over £5,000,000; now it is said the total outlay will be nearer £10,000,000 sterling, which will make the undertaking a very costly one. It cost the friends of the measure enormously to "put it through," and a three years' fight. The Panama canal scheme, enormous as the cost will be of that undertaking, is in progress, and the much talked-of Nicaragua canal has by no means been abandoned. The Welland canal will probably be greatly enlarged; also the Erie canal is likely to be widened and deepened. The friends of the Hennepin canal scheme have not yet abandoned all hope of its success. Canals still engage the attention of the most enlightened nations in the world, for the reason that a large extension of inland water carriage affords the only rival to the grasping avarice of railroads. Canals solve the question of cheap transportation; they make cheap transportation possible. The day for improvement of our natural water-ways and the construction of artificial ones will never go by.

ELECTRICITY ON RAILROADS.—While electrical propulsion for street railroad cars is generally pronounced a failure in England, Mr. Field recently declared in London that within a short time electric motors would be as complete a success in New York as horse cars are now on their street railroads. He further declared that the experiments thus far have proven that we have not yet claimed half enough for electricity in this direction. The *London Electrical Review* in noticing these remarks says: "We suppose that after the electric propulsion of electric cars has been successfully established in America for a few years English capitalists will be found who will pick up courage enough to do something of a practical nature in that direction at home."

USEFUL INFORMATION.

Repairing With Brass.

A special method of repairs with cast brass for large and valuable castings which cannot well be spared while new ones are procured, such as cylinder saddles broken through a steam connection or other projecting part, has been devised by Herr Haas, Government Master Mechanic at Berlin, and is illustrated in the *Organ*. The process is as follows: The main casting is cut off inside the crack to a fairly uniform line. A model is then made by means of the portion cut off to fit over the end of the break and make the necessary junctions with the adjoining parts of the machine. The lower half of the mold flask is fitted around the broken end of the casting and well secured to it, and the joint is sealed with clay. The model is then set into the flask over the broken end, on which it, of course, should lap a certain amount, and the molding is proceeded with. The upper half of the flask has, of course, a core fitting into the hollow of the broken end, if such there be. Before casting, the broken end is well warmed by a charcoal fire placed within, and the precaution is generally taken of boring several holes into the broken end around the part on which the patch takes hold, into which the fresh metal runs and forms lugs, making a firmer connection between the new and the old parts, though the chief reliance is on the shrinking of the new casting around the end of the old one. The heating of the old portion is done to avoid having this shrinking excessive and to prevent chilling.

Several repairs of this sort have been made by Herr Haas with entire success, the parts still remaining in active use, though a considerable time has elapsed since the repairs were effected.

ABOUT SCREWS.—In an article on the manufacture of screws in Rhode Island the *Providence Journal* says: "It is interesting to note that, while the manufacture of wood screws probably originated in Westphalia, Germany, and was subsequently carried on in Eastern France and England before its introduction into this country, American inventors have supplied the machinery that is now universally employed. The popular feeling that the gimlet-point screw is a modern invention is erroneous. The American Screw Company have in their possession sample cards of French screws, pointed, though not so perfectly made as at present, which were brought from France early in the present century; and from an old piano now at Northampton, made about the year 1750, screws have been taken showing the same feature. Patents have been issued on gimlet-pointed screws, but they covered only a peculiar form of point." The gimlet is said to have been invented by Daedalus, a Greek.

RIGHT AND LEFT-HANDED.—A right-handed man is a man who takes hold of a hoe, a rake, a spade, or a fork, with the right hand down and the left hand up or nearest the body. A man who habitually puts his left hand down, or, for instance, the man who places his right hand on the top of a spade, and grasps the handle or shake with his left hand is a left-handed man. And so with an axe. A right-handed and a left-handed man can work together in chopping down a tree. If they were both right-handed or both left-handed they could not do this unless one chopped on one side of the tree and the other on the other side. And so it is in loading earth into a wagon. If the men stand face to face one should be left-handed and the other right-handed. In hoeing a row of corn the right-handed man will walk on the left side of the row, while the left-handed man will walk on the right side of it. We think there are more left-handed men (in this sense) than right-handed men.

HEAT WASTE IN STOVES—GAS VS. COAL.—Tests made by Dr. Fischer, the well-known German chemist, show that in the ordinary domestic stoves in use not more than 20 per cent of the fuel consumed is really utilized for warming the rooms, whereas with stoves burning gas 80 per cent and more of the possible effect is obtained. In a certain sugar manufactory at Elsdorf, it is stated, no steam engines have been used for several years. Gas is made at a cost of about 20 cents per thousand feet, and is used for lighting and for driving gas engines. At the great Schultz Iron Works at Essen water gas is made at a cost of about 8 to 16 cents a thousand feet, and serves both for fires and lighting. For the latter purpose a ring is fixed over the burners, having rods or pencils of magnesia attached, these being made glowing hot by the non-luminous gas flame, and emitting an excellent light. The abandonment of burning coal direct for heating will do away with all the disadvantages of smoke.

CARE OF AN OIL CLOTH.—An oil cloth should never be scrubbed with a brush, but, after being swept, should be cleaned by washing with a soft flannel and luke-warm or cold water. On no account use soap or water that is hot, as either would have a bad effect on the paint. When the oil cloth is dry rub it well with a small portion of a mixture of beeswax softened with a minute quantity of turpentine, using for this purpose a soft furniture polishing brush. The following is also used to keep oil cloths looking well: Wash them once a month in

skimmed milk and water, equal quantities of each. Rub them once in three months with boiled linseed oil. Put on a very little, rub it well in with a rag, and polish with a piece of old silk.

TO COLLECT THE ODORS OF FLOWERS.—Roses and all other flowers containing perfumed oils, may be made to yield their aromatic qualities by keeping the leaf petals in a saucer of water and setting it in the sun. The water should be soft or rain water, and a sufficient quantity allowed for evaporation. In a few days a film will cover the water. This is the essential oil of the flower; every particle is impregnated with the odor. It must be taken up carefully and put in tiny vials, which should remain open until all the remaining water is evaporated. A few drops of this will perfume glove-boxes, apparel, etc., and will last a long time.

SWAYING OF LOCOMOTIVES.—Attempts have been made with considerable success on German roads to diminish the swaying of engines, and with it the wear of the rear driver flanges, by making the tender coupling more or less rigid laterally; and, indeed, four wheeled locomotives have been used on some roads for line engines by having heavy shoot bolts on each side entering sockets on the tender, and thereby preventing either vertical or horizontal swaying.

HOW TO MAKE FLORIDA WATER.—Dissolve in $\frac{1}{2}$ gallon 90 per cent alcohol, 1 ounce each oil of lavender, oil of bergamot, and oil of lemons, and of oil of cloves and cinnamon, 1 drachm each; add one gallon water and filter. Or, take of oil of bergamot, 3 ounces; oil of cinnamon, 4 drachms; tincture of benzoin, 2 ounces; 75 per cent alcohol, 1 gallon. Mix and filter.

TO KEEP MICE AND RABBITS FROM TREES.—Dr. Sanborn, of Illinois, states that he protected completely from rabbits and mice his 600 pear trees with a wash of lime and water, with enough coppers added to change the color to a deep green. Some cheap glue was added to make it adhere to the trees. Neither rabbits nor mice would touch the tree thus treated.

A GERMAN TEST FOR WATERED MILK consists in dipping a well-polished knitting needle into a deep vessel of milk, and then immediately withdrawing it in an upright position. If the milk is pure, a drop of the fluid will hang to the needle; but the addition of even a small proportion of water will prevent the adhesion of the drop.

GOOD HEALTH.

The Faith Cure.

The faith cure is interesting a great many persons. In New York City there are several establishments where it is practised. We have one church drawing immense crowds, in which the special object is to pray for the sick. Thousands of the sick visit this church seeking cure. We hear of many wonderful cures. If one ventures to express a doubt he is denounced as a person without faith in God. Every good person must rejoice over the reported sudden cures, without drugs, if he can believe in them. For myself, I believe there are thousands of discouraged people who are cured this way. Organic diseases are never cured in this way, I think, but those maladies which consist in low spirits and nervous prostration are. A lady has recently assured me that when she went to this faith-cure church for prayers, she was so weak that she had to lean upon two friends. An hour later she came home without assistance, and has enjoyed better health ever since. I do not doubt it. Another assured me that she had suffered for some months with rheumatism in her hips, and was scarcely able to attend to her household duties; she visited the prayer-room and was immediately cured. Upon inquiry I found that she had not been quite free from pain or stiffness since, but had been performing the duties of housekeeping, which seemed to her impossible before she was prayed for. Did not excited hope and imagination lift her into the new life?

I believe there are many persons crippled with rheumatism that might be helped in the same way. One is asked, "Do you not believe that God can cure disease, and do you not believe that the prayers of his saints may move him?" I believe He who made man may cure him of disease, and that our Father in Heaven will hear the cries of his children. Whether he will contravene the law which He has Himself established, that a hand thrust into the fire shall burn, that one who steps off a precipice shall fall, that one who outrages his health shall suffer, is another question. The only God-ordained management in these cases consists in keeping the hand out of the fire, keeping away from precipices, and observing the laws of health. Whether a woman who has committed herself into various dislocations and nameless sufferings may look to God for the sudden removal of the results of her folly, is the question.

One gentleman assures me that he took to this faith-cure church a friend with an organic disease of the heart, which hourly threatened his life. The sufferer was prayed for and immediately cured. I do not believe it. Another gentleman assures me that he saw at the faith-cure church a man with an immense goitre. The swelling was so large that it could not be concealed. Several Christians gathered in a circle about him and prayed for him with great

passion. When they opened their eyes and looked upon the man, who had carried the large neck-swelling for 30 years, lo! and behold, it was gone. This I do not believe. We are fond of the marvellous, and delight in nothing so much as telling of wonderful things. Out of this passion come most of the miracles of the faith cure.—*Dio Lewis.*

Hammocks Versus Beds.

"Traveler" writes to the *Lancet*: "Beds are occupied night after night, year after year, by divers persons in sickness and in health, in summer's heat and winter's cold, and as to when bedding is remade and purified each one can judge by his own experience. Compare this with the use of the South American hammock, which only requires a stout blanket inside, and in winter a woolen sleeping dress as well of suitable make—i. e., drawers, socks and a loose jacket, all periodically washable. The sanitary difference becomes at once startling to those who have never considered the subject before. The South American hammock is made of the fibers of the young leaves of the ita palm (*Mauritia flexuosa*), so woven that it yields to every movement and projection of the body in every direction, except lengthwise, in which direction the weight of the body establishes its own support, the same as in chairs with the loose canvas backs. Hammocks are very easy to get into and out of, and one cannot fall out of them when asleep. They should be swung the same distance from the ground as the seat of a chair; they form an excellent seat. Sitting down one draws the back of the hammock up as high as one may desire. The proper way to get into a hammock—for there is a proper way—is first to sit down on it and then throw the legs up and the back down, wrapping yourself up in its soft, elastic and ample folds. The best way to lie is crosswise; the position can be varied in three or four ways. The writer has passed several nights in such a hammock and blanket, exposed to the damps of a South American forest, and risen perhaps more refreshed than if he had slept in a bed. In many cases in hospitals such hammocks would be real sanitary appliances. The hammock I have comes from the Essequibo Indians in British Guiana. I do not know why a similar mode of open weaving (more like knitting without the knots) of some material having the mellow feeling of the rush used in the rush-bottomed chairs could not be managed in this country."

MEDICINAL QUALITIES OF TURTLE OIL.—The oil is of a yellowish color, and at ordinary temperatures in this country forms a thick, finely granular fluid, in consistence something like olive oil partly congealed. A gentle heat renders it clear and transparent. It possesses little odor or taste, and does not quickly turn rancid. Taken in warm milk it is not so objectionable as codliver oil. Turtle oil has been used with the most beneficial results in all cases where codliver was indicated, in persons to whom the nutritive process was defective, in children of strumous disposition, in the sequelae of scarlet fever, in measles and other acute specific diseases. It has proved of the greatest service in scrofulous affections of the eyes, nose and other parts, and has been most beneficial in chronic bronchitis, gout, rheumatism and syphilitic affections; but more particularly useful in phthisis pulmonalis in all its stages. Turtle oil is borne well by the stomach, causing neither nausea, eructations, dyspepsia or diarrhoea.

REDUCING OBESITY.—We see it stated that there are four plans for reducing obesity. First, the eating of nothing containing starch, sugar or fat, which is the Banting system. Second, the eating of fat, but not sugar or starch, called the German Banting. Third, wearing only wool, and sleeping in flannel blankets instead of sheets, the Munich system. Fourth, not eating and drinking at the same time, or rather, within a couple of hours, the Schweininger system. There is another system which I think is better than any of these; it is to simply eat what agrees with you in such moderate quantities that your flesh will reduce, say, a pound a week. This may not tickle the fancy like some of the above, but it is the best of anti-fat means. It will operate perfectly with a man or a horse. You can easily reduce a horse from 1200 to 1000, or a man from 200 to 160.—*Dio Lewis.*

WALKING is the best of exercises, and if spirited and the arms be allowed to swing freely, it brings into play the muscles of the upper part of the body as well as the lower half. Walking, if well managed, is better in one respect than exercise in a gymnasium, where you get little sunlight and where you are likely to breathe dust and impure air.

LIGHT AND HEALTH.—No plant or animal can digest in the dark. Try it. Plant a potato in your cellar. See how slender and pale it grows. Now open a window in another part of the cellar and notice how the poor hungry thing will stretch that way. The process of digestion, the great function of assimilation, cannot go on without sunshine.

THE TEETH.—A clean tooth will not decay. It is the food left between the teeth which causes the trouble. The part of the tooth which you can reach with the tooth-brush does not decay if the brush is used. The decay takes place between the teeth, especially the double teeth, where the tooth-brush cannot reach.

MINING SUMMARY.

The following is mostly condensed from journals published in the interior, in proximity to the mines mentioned.

CALIFORNIA.

Calaveras.

A BIG MINING SALE.—*Calaveras Chronicle*, Sept. 25: The "Fine Gold mine" located in the new district east of Railroad Flat, this county, we are informed, was sold last Monday to Mr. Wm. Clary, superintendent of the Sheep Ranch mine, and Mr. P. Kervin of San Francisco. The price paid was \$30,000 in gold coin, a nice little fortune for the two French gentlemen, the Messrs. Guilliman, who were so fortunate as to be the owners. This mine, although a recent discovery, has the reputation of being a splendid property and there is no question but what the purchasers have a bargain in its acquisition. We understand that our old friend, Mr. T. J. Sevrans, and a miner of much experience, is in present charge of the property, and that he has already begun active operations preparatory to the thorough development of the mine. He is grading a fine road to Rose's saw-mill, and will at once erect a large boarding-house, office, etc. The owners are preparing to sink a 500-foot double compartment shaft, besides running a tunnel that will tap the ledge at a great depth.

Inyo.

IBEX.—*Inyo Independent*, Sept. 26: The Ibez mine of Death valley has started up again under the superintendency of Mr. Little. Mr. Little has already taken out several miners and millmen and we may expect to see some of the results in bullion soon. A recent run of ore from the Keynot netted \$3000. A run of ore from the Chulula mine averaged \$34 a ton. At the Keynot mine there is a large dump of ore that had been cast aside as too low grade to work. A miner recently screened out two tons of this waste and worked it, it yielding \$25 a ton. Mike Lasky and John Anton will screen out the remainder of the pile and mill the screenings. There is estimated to be a thousand tons of ore on the dump. About 50 tons of ore will be shipped from the Union mine, at Cerro Gordo, in a few days, by John Basto and his partners. At the Minetta mine, White Hill, Billy Hedge is getting out a good deal of nice silver and lead ore. The mine is looking well, with a good vein of ore in sight. A couple of Mexicans have made a rich discovery of gold about 16 miles south of this place at the end of Old Dads mountain. The ore assays about \$150 to \$200 in gold, carrying considerable silver. The find is attracting a number of old prospectors and no doubt more will be heard of it ere long.

Mariposa.

THE CRANBERRY MINE.—*Herald*, Sept. 25: A. H. Ward, one of the owners of the Cranberry mine, was in Mariposa last Monday evening, and to a *Herald* representative said that the report that a rich strike had been made in the mine was true. The ledge is 11 feet thick and the rock immensely rich. Preparations have already been commenced to build a mill, but it is hardly probable that it will be completed before spring. Mr. Ward has spent a large sum of money in this county prospecting, and the news of this strike will please everybody who is interested in the development of the mining resources of the county. The Cranberry mine is located about two miles almost due north from the Hite mine on the north side of the main Merced river. It is at an elevation of about 2700 feet above the sea, and some 1100 feet above the Merced river. The formation in which the mine lies is granite with slate walls, the granite being superimposed on a fundamental slate formation. Messrs. Ward & Craig have two water-power arastras which they have kept in motion for four months or more, grinding about one ton per day of rock, with an average yield of \$34.60 per ton. This rock was taken from the old shaft opened by Mr. Craig. The new strike is by a crosscut about 500 feet southeast from the old shaft, and on the opposite side of a ridge giving a lift of over 100 feet on the vein.

Napa.

RICH ORE.—*Napa Reporter*, Sept. 25: At the office of Sheriff Harris there can be seen a large specimen of silver ore taken from the Grigsby & Johnson mine at Calistoga. The lump weighs 40 or 50 pounds and is certainly rich enough to assay \$500 or \$600 to the ton. In the Grigsby & Johnson mine there are hundreds of tons just as rich as this specimen now in sight. There is no disputing the fact that one of the richest silver mines in the State is situated at Calistoga, and it would not surprise us in the least to see Napa counted among the great silver producing districts in a few years. Mr. Grigsby is not pushing the work on this mine although he has already taken out an immense amount of ore, and will probably erect a stamp-mill in the near future. He is now waiting for the completion of the Selby Smelting Works near Port Costa, and when this large establishment is in full running order he will ship a large quantity of ore there to be worked. When it is taken into consideration that he will only ship ore that will produce over \$100 to the ton, and that he has hundreds of tons of that sort all sorted and ready for shipment, some idea can be formed of the richness of this mine.

Nevada.

WORKS NICELY.—*San Juan Times*, Sept. 20: A few weeks ago we announced the fact that the Malakoff Mining Company had commenced the construction of an elevator upon their mine to determine the feasibility of working it on the elevator plan. Richard Thomas, of Birchville, was sent up there to superintend the construction of the works. Monday last he called at this office to say that so far as tested the works are a success. By means of a 22-inch iron pipe and 1100 inches of water, with 400 feet pressure, debris has been elevated to the height of 50 feet perpendicular or over 60 feet on an incline of about 45 degrees. Mr. Thomas is of the opinion that with a smaller tube and the same quantity of water and pressure the debris can be elevated at least 70 feet. He is of the opinion that with 900 feet pressure the debris can be elevated 100 feet—the height required to work the mine successfully. At present the amount of water used upon the bank is 900 inches, while 1100 inches are required to elevate the debris 50 feet perpendicular.

Shasta.

COPPER CITY.—*Republican Free Press*, Sept. 26: Lute Bahney informed us Thursday that every fur-

nace is in full blast at the Winthrop mine, and that the mill is running night and day, and that the mine is turning out some very high grade ore. Lute brought down a beautiful silver brick worth about \$500—the first one produced. The managers of this enterprise have been feeling their way very carefully, and it is more than probable that this district will at last prove a source of wealth.

Siakiyou.

SUMMERVILLE.—*Cor. Yreka Union*, Sept. 24: Summerville is on the south fork of Salmon river, about 50 miles from Etna. At this point hydraulic mining has been carried on for a number of years by Messrs. Bennett & Miller, and owing to the accidental death of the latter member of that firm, some years ago, Mr. Bennett, the surviving partner, sold this mining property to Messrs. George Smith, R. H. Campbell, and George C. Spooner about two years ago, for the sum of \$15,000. Mr. Spooner, being a practical hydraulic miner, was made superintendent. After one year's run with the then water facilities, being two small ditches from Rusb creek, enough was learned of the value of the mine to induce the owners to extend their water facilities by bringing in the water from the main river and the Little South Fork, which would give an abundant supply ten months of each year, and without any stoppage during the whole year. This involved the heavy outlay of nearly \$40,000 and a year's time. The main ditch is about five miles long and cut in bedrock almost the entire distance. It is five feet six inches in width at the top, and three feet six inches wide on the bottom, and two feet six inches deep; it has a grade of one inch to each foot, giving it a capacity of 3000 inches. The upper half mile of this ditch, owing to the perpendicular cliffs of solid rock, is built of flume, and in the most substantial manner. At a point one mile below the head dam on the main ditch the water from the Little South Fork forms a junction with the main ditch, conveyed through an iron pipe 1000 feet in length from the opposite side of the main river and across a suspension bridge 100 feet above the river. This piece of mining engineering is a masterpiece, and reflects great credit on Mr. Spooner, and is convincing evidence that he is master of the situation. The main ditch, when it reaches the mine, has an elevation of 500 feet above the river bed, while the gravel to be washed lies 100 to 200 feet above the river, giving from 100 to 200 feet for dumping purposes, and from 300 to 400 feet pressure through the great iron pipes and massive giants. In addition to the purchase made by this company from Messrs. Bennett & Miller, they have secured 640 acres additional ground, covering the entire Petersburg flats, making in all near 1000 acres of mining ground, ranging from 10 to 100 feet deep, requiring with all their great advantages, forty to fifty years to exhaust. As to the richness of the ground, everyone that ever lived or mined on the Salmon river and its tributaries, knows that the Salmon, from its source to its mouth, was immensely rich. It is not supposed that such richness exists in these deep deposits on the high benches as did in the river bed and rim rock, but it will be readily seen that they do not have to be as rich by a great deal to pay under the great advantages. It is expected now by this company, as soon as the water raises to an ordinary head, to keep three giants running night and day. Everything is in readiness for this.

San Bernardino.

CALICO DISTRICT.—*Print*, Sept. 27: The Dora Belle, adjoining the Bismarck on the south, is still looking well. A few tons of good ore are on the dump, and the work of sinking one of the shafts is progressing. There are two shafts, one about 50 and the other about 75 feet deep. This claim is being worked by Page & Thomas. Operations on the Bismarck are not so extensive as they were some time ago, as the largest portion of the surface deposits has been thoroughly worked and exhausted, only 10 men now being employed in prospecting and taking out ore. The ore that is being extracted is of a high grade. Only two or three tons of ore are being taken out daily, but it is such a high grade that it yields a good profit. The Exchequer continues to look well, and is regarded by all who have examined it as a good mine. The tunnel is in about 25 feet and a shaft down 65 feet, besides several prospect cuts. A few tons of ore were taken to the mill that returned 120 ounces to the ton. A few chlorides are working on the Kearsage, and if all of them are doing as well as Reeves Unsworth then the mine contains an abundance of rich ore. The Blackfoot still looks rather indifferent, but as other mines have looked equally as bad and afterwards developed into fine bullion producers, there are yet grounds for hope that this mine will result similarly. J. W. Coleman is chloriding on the Bullion adjoining the Exchequer, and his work is showing up well. There is an 80-foot tunnel and a 25-foot shaft on the mine. Only 12 men at work at present on the Occidental mine, mostly engaged in prospecting. A chamber of rich ore has been struck near the south end of the claim. The main tunnel of the Garfield has been extended westward about 1500 feet and is in the Thunder some distance, where a fine body of ore is reported to have been recently struck.

Sierra.

WILL NOT RESUME NOW.—*Sierra Tribune*, Sept. 26: We are informed that the Marguerite mine will not resume operations before next spring. There is discord among the owners, and they cannot work the mine till an amicable settlement is reached. This is to be regretted, as the Marguerite is known to be a rich mine. The Sierra Buttes chlorination works are running in full blast, with Albert Maltman as superintendent.

AMERICAN HILL.—*Mt. Messenger*, Sept. 26: The company that is opening the American Hill quartz property has bought the engine formerly used at the Colombo mine, and it is now being hauled to American Hill. One-half of the balance wheel went through here Wednesday, which weighs 6000 pounds. A wheel that would weigh 12,000 pounds it would seem ought to balance almost anything. The Colombo Company is disposing of its engine because it has found water enough in its tunnel to run its mill when it desires to start it. Richard Fischer, of Sierra City, returned to Downieville last Thursday morning from Secret canyon, and reports the Big Crevice Company's tunnel in 200 feet, with face in hard slate. Pay gravel is expected almost any day. In early days about \$6000 is said to have been taken out of a shaft down 30 feet from a point above by some miners, who came to town for a jollification over their good luck, and on going back found their

diggings all caved, which so discouraged them that they quit work.

GIBSONVILLE.—The Union mine has struck mountain dirt in their shaft. We hope the Gravel Hill mine will be as lucky with their new shaft as its neighbor (the Union) has been.

FOREST CITY.—Judging from the amount of timbers around the South Fork mine, operations at that place will soon begin. The weekly clean-up at the Extension last week was about 147 ounces.

San Luis Obispo.

ASPHALTUM MINING.—*San Luis Obispo Tribune*, Sept. 23d: But few people are aware of the extensive business that is carried on in this county in mining, refining and transporting asphaltum. This substance is found in various parts of San Luis Obispo as well as throughout the entire coast region of California, but that of the Tar Spring rancho, in the southern part of this county is regarded as superior to any found elsewhere, being, under the usual treatment, less liable to crack or crumble. It sells at \$10.50 per ton in San Francisco. Scheerer Bros., of San Francisco, are working these mines. They recently had a large contract in lining the University Hill reservoir, of San Francisco, in which 850 tons of asphaltum was used. With the exception of 50 tons, all this came from San Luis Obispo. Some fifteen teams are employed in hauling, and Mr. Conrad Scheerer, who has just been visiting the mines, says the road to them is badly cut up by the great amount of hauling that has been done. At present there is about 30 tons of refined asphaltum and as much crude on the ground, but the recent excessively hot weather has stopped work during its continuance. The ground is melted and the asphaltum is too soft to pick and too stiff to pump. Under the treatment by the Scheerer Bros., this matter is used very successfully in making sidewalks, pavements, roofs and in making paint, felting, etc.

Trinity.

DEADWOOD ITEMS.—*Trinity Journal*, Sept. 25: A Deadwood correspondent furnishes an interesting letter this week, which we are compelled from lack of space to condense, as follows: "In addition to the older mines which have been in successful operation for several years, Gibson & Blagrove, on the Black Bear extension, have some extremely rich rock in the lower tunnel and about 30 tons of the same kind on the dump. P. Varnum is extracting good ore from the Sargent and McDonald location. Frank Belleau & Co. are opening a large vein of good ore, which has a large per cent of rich galena sulphurets. Westlake and Co-grove have a good vein of high grade ore. Boothby & Hendricks have a small, rich vein. Brown & Co. are making developments on a ledge situated above the St. Auburn, on Thorn Gulch, which gives every indication of permanence and value. McDaniels & Co. are pushing their tunnel ahead in good shape; they will crush their ore in Gibson's cannon-ball mill. Minear & Co.'s new Huntington mill is in full blast and runs like a charm. Quite a number of prospects in the district are undergoing development.

Tuolumne.

NOTES.—*Union Democrat*, Sept. 20: The Santa Maria mine and mill at Crocker's Station has been shut down. We did not learn the cause. The Empire Mill Co. is putting the boilers up for the new saw-mill at Brown's meadows. In a very short time the saws and lighter machinery will be put in place when the mill will be ready for operation. John Collins has leased the Alabama mine and mill, at Jamestown, from Bell & Harris, and will immediately commence operations with a small force. Work on a large scale will not be inaugurated till water can be had to run the mill. The rumor that the Rawhide mine would soon be started up does not appear to have much foundation in fact. A large share of the mine is the property of an estate now in probate, and until some definite settlement of the estate has been effected there is small chance of the mine being operated.

LOW RIVERS.—*Tuolumne Independent*, Sept. 23: The rivers are lower now than ever before known; so say old observers. This gives river miners their golden opportunity, unless heavy rains ensue. The claim of Fitch, McQuade & Co., on the Stanislaus, is now in full operation; but, as the claim is located to one side, in an old bed of the river, considerable rain will have to fall before they will be flooded out. The claim of R. J. Moffit, however, is apt to be greatly injured by a considerable rise in the Tuolumne. The place where he is operating is narrow, the walls of the canyon being almost perpendicular. From the dam above, the water at present in the river is conveyed over the dam below through a large rubber hose. The water which collects between the two dams in the river, is pumped over the lower dam. The river bed is supposed to be very rich at this point, and it is hoped that Mr. M. may reap an abundant harvest from his enterprise, in which he has invested many thousands of dollars.

NEVADA.

Wahoe District.

HALE & NORCROSS.—*Enterprise*, Sept. 26: At the time of the breaking of the crank shaft of the hoisting engine at the Combination shaft on Wednesday, everything was going along finely. The two lateral drifts south and north from the Hale & Norcross deep winze and from the Combination joint west shaft, on the 300 level, were rapidly progressing towards connection, there being only about 50 feet intervening space remaining. This will be done away with before the end of another week, when crosscutting west will be in order. Both these connecting lateral drifts have been cutting through bunches and streaks of ore, evidently offshoots from the ore vein which is about to be crosscutted into, and strongly indicates what may be expected to be found in the vein itself. The cross drift west from the deep winze on this same lowest level was also showing exceedingly well at the time of this little interruption.

CON. CALIFORNIA AND VIRGINIA.—The repairs of the old Con. Virginia shaft are completed, and in a few days the Eureka mill on the Carson river will be in first-class condition ready for ore reduction. Out of 60 stamps at the Eureka mill only one-third could be kept going, but the chances are that the present cooler weather will have a tendency to check evaporation, raise the springs and perhaps induce an increase of Carson's rolling, turbid flood. No ore is being extracted from the Jones lease section at present, but a few men are kept at work timbering, opening up new drifts and sections, etc. The 1780 level,

being worked by the company, continues its good little yield of over 100 tons per day, worked by the Morgan mill, which is a steam mill. This ore during the past week gave average assays of over \$20 per ton.

BULLION.—It is rumored that prospecting work will be resumed shortly in the upper workings of this mine. No paying body of ore has ever been found in the Bullion mine at any depth, from the lowest up, and in fact the only indications of ore worth mentioning have been found in the croppings. With proper encouragement to tributaries, leasers or contractors a good body of ore, after the Belvidere style, might be uncovered in the upper part of that mine which otherwise might remain buried from human enterprise or cupidity forever.

SIERRA NEVADA.—On the 520 level the crosscut west from the north lateral drift, 1000 feet from the shaft, has been extended 52 feet during the week, making a total distance of 372 feet. The face is in vein porphyry, with promising streaks of quartz and clay, and a small seepage of water. It has 152 feet yet to go before reaching the west wall of the ore vein, and very interesting and valuable developments may be looked for at any time.

CROWN POINT.—Nothing but repairing and prospecting work is being done in either this or the Belcher mine at present. Should the present cool and threatening weather induce a rise in the water of Carson river sufficient to allow the mills to run to good advantage, ore extraction and reduction would doubtless be resumed. The repairs to the Crown Point gallews frame and surface of the shaft are making good progress.

OPHIR.—The drift west on the 500 level from the old Mexican shaft is out nearly 100 feet and has cut into the old ore vein and workings of the Ophir Company, which were abandoned years ago by reason of no profit in their extraction at the expense of those days. It is anticipated that much good paying ore will now be extracted at that point.

GOULD & CURRY.—West crosscut No. 1 is now out 442 feet, 48 feet having been added during the week. This crosscut is at the north line of the Savage, and shows good ore indications, being in vein porphyry, quartz and clay, but no water. The old El Dorado tunnel, connecting with the Bonner shaft, has been cleaned out and repaired throughout.

MONTE CRISTO.—The new shaft has nearly attained its projected depth of 150 feet, and is cutting into the ore vein 100 feet deeper than it was ever opened before. Good results are being realized, which will be more definitely developed the next week or two.

BEST & BELCHER.—West crosscut No. 2, on the 1000 level, was extended 43 feet during the past week, making a total length of 239 feet. The chute being constructed on the El Dorado tunnel level, conjointly with the Gould & Curry Company, is completed.

CHOLLAR.—As stated elsewhere, the breakage of the crank shaft of the hoisting engine at the Combination shaft has caused a temporary interruption of work in the lower level (the 300), but that will be all right again the first of next week and work fully resumed.

YELLOW JACKET.—The usual daily yield of between 160 and 170 tons per day continues to be extracted from the old workings on and above the 1300 level. The Brunswick mill runs steadily right straight along, doing excellent work.

UNION CONSOLIDATED.—On the 500 level the main lateral drift north is making good progress and has attained a total length of 697 feet. Considerable retimbering has had to be done during the past week or so.

MEXICAN.—On the 500 level the middle crosscut east is now out 203 feet. The material in the face is vein porphyry, clay and quartz of a damp, heavy nature, looking favorable for an ore body.

ANDRES.—The drifts west on the 175 and 375 levels are progressing well, both in good promising indications, the lower levels especially being in fine looking quartz giving low assays.

KENTUCK.—The regular daily yield of 30 tons continues to be hauled by teams to the Rock Point mill on Carson river for reduction.

ALTA.—The west crossdrift from the main lateral drift is making good progress in hard blasting rock.

Cottonwood District.

NICKEL AND COBALT.—*Reese River Reveille*, Sept. 20: Over at Cottonwood the famous nickel and cobalt mines are attracting considerable attention from outside capitalists. Not longer ago than last Sunday Grant's brother-in-law, Mr. Honore, and a Mr. Palmer of Chicago and Hensch of San Francisco were there looking at these mines. The latter has the mines at Lovelock bonded for \$35,000 and the time expires very soon. There is nickel enough there to supply the world and in a short time will doubtless be heard from.

Eureka District.

THE EUREKA CON.—*Sentinel*, Sept. 26: The work preparatory to the erection of the new furnace at the Eureka Con. reduction works is progressing favorably. The carpenters have about completed the heavy work on the building being erected, and on the second floor of the same the blower has been placed. The furnace and all its castings have arrived from San Francisco, and just as soon as the stone-cutters get through with their job and the different parts of the new furnace are put together the results of the work in progress now for several weeks will be readily seen to advantage. The bins at the smelting works continue to be well supplied with ore, nearly all of which comes from the company's mine. The work of removing the "Jumbo" hoisting engine from the hoisting works over the mine, preparatory to putting in a new steam engine, continues. In short, there are many evidences that the company are laying the foundation for large and extensive operations in the near future.

ORE SHIPMENTS.—*Sentinel*, Sept. 26: During the week ending yesterday ore shipments were made from the mines of the district to the two reduction works in town as follows: To the Eureka Con. works—Jackson, 56 tons; Frazier & Molino, 8½; Home Stake, 2½; Summerall, 1½; Heyer, 2½; Rose, 5½; California, 30; Bald Eagle, 5; and Ernst, 1½. To the Richmond smelters—Silver Lick, 83 tons; Continental, 4; Barton, 9; Lord Byron, 5; Dunderberg, 42; Diagonal, 5; Empire, 5; Excelsior, 1½, and Blue Run 6.

Granite District.

MANY PROSPECTORS.—Reese River *Reveille*, Sept. 20: Granite district is on the other side of the valley from INL district. Here the ledges are smaller in size, but richer, giving from \$300 to \$500 per ton, but they are plenty large enough to pay handsomely. Many prospectors are there now with excellent indications ahead of them.

INL District.

EVIDENCES OF LIFE.—Reese River *Reveille*, Sept. 20: INL district is beginning to show evidences of life after a long rest. The Black Prince ledge is a remarkable one. The croppings are from 100 to 120 feet thick and they have sunk on it and find the regular formation is 100 feet. This ore is about all silver bearing, only a trace of gold being found, but it contains lead and silver enough to make a fine flux suitable for the process they propose to use there. They have been fortunate enough to secure the service of an experienced Swansea smelter who will personally superintend the erection of the smelting works and run them. He is satisfied that the total cost of milling and mining the Black Prince ore (which assays from the croppings from \$40 to \$50) will not exceed a quarter of that amount. The presence of the lead and galena are very valuable in the process to be used. They are now crushing quartz to make their own fire brick and have everything needed to start operation. They propose to go slow and sure and gradually develop their property. That it is an immense mine they know, but they are not going to be too fierce to rush it at first. This company will also take hold of the Spar mine, which is an extension of the Black Prince and develop it too. The Spar is owned by Kellogg & Irvine.

Secret Canyon District.

TRIBUTERS.—Eureka *Sentinel*, Sept. 25: Many of the tributaries in Secret canyon are taking out ore and making money. The Scorpion mine in Page canyon is yielding some ore of exceedingly rich quality. Messrs. Spargo, Serpell & Co., are taking out rich ore from the Water Jacket mine in Page canyon. Richard Berryman is taking out 10 sacks of rich ore per day from the Contention mine, Page canyon. Abe Laird has done some "tail" work in the Rambler series lately, and his prospects are steadily improving. Ben Levy and Jim Allen have a streak of rich ore in the Hannon claim, Secret canyon, at 12 feet from the surface. Messrs. Nelson & Anderson are doing very well in the Geddes mine, and will make another shipment to the furnaces this week. Messrs. Pope and Berryman have another shipment of ore ready at the Blue Kain mine, which will be shipped to the furnaces this week. The ore in the Contention mine is making in the direction of the Medora mine, and there are parties seeking a lease of the latter from H. K. Mitchell, Esq. Capt. J. M. Foley is expecting to ship ore from his mines at Secret canyon shortly. He has a fine lot of mining ground which he is working hard to develop.

ARIZONA.

VARIOUS MINES.—Clifton *Clarion*, Sept. 25: The Guthrie Company have shipped to the Metcalf deposit all the siftings accumulated at the Alaska since it was opened. This ore is exceedingly rich in carbonates and glance. A new drift, starting from the shaft of the Alaska, was driven and a rich body (two feet) of ore was cut. The gold claim, Vanderbilt, owned by the Bonnell Bros., shows the same ledge matter in the shaft, which is now 45 feet deep, that it did when ground was first broken. The formation is lime and porphyry, lime the hanging and porphyry the foot wall. If, after the shaft has been sunk 80 or 100 feet without showing any indications of pinching or breaking off, it is safe to predict that the Vanderbilt will be a great gold producer. The gold in the ledge matter is of a free milling and flaky nature and the ledge matter resembles talc—some call it talcose and others hornblende quartzite or decomposed quartz. In the immediate vicinity of this strike are some of the best mineral leads in Arizona, all of which have to be developed to prove their value. The outlook, however, for early development is not good, because the owners have not the means. Rails have been laid in the incline tunnel at the Longfellow and a whim put in. Ore is brought out from it now and the old adit abandoned. The ore bodies at the Montezuma, Upper and Lower Yankee, Detroit and Arizona Central look fine. In fact everything connected with the Detroit Company's management shows thrift and enterprise.

MEXICAN.—Mohave *Miner*, Sept. 23: They have about seven tons of ore on the dump, sack samples from which run from \$60 to \$120 per ton, and which is the result of about three weeks' work. They expect to complete the carload and ship it early next week, and it will probably be sold to the Kingman Sampling Works. The Reward mine is one of the late new strikes, and is an extension of the old and well-known Mocking Bird mine. The ore is about eight inches wide, and a recent sample taken from the bottom of the shaft assayed 387 ounces in silver. They have quite a pile of this character of ore on the dump, which they will soon ship and from which they expect handsome returns. The Oro Plata mine is one of the oldest and best locations in the Todd Basin, and is credited with having produced in the neighborhood of \$100,000 since its discovery. It is now owned by L. A. Sanderfoot, of San Francisco, but is being worked by Messrs. Maxson and Murphy under a lease. They have been working some three weeks, and are running in the lower tunnel, which is now in about 150 feet. On the Primerosa mine Messrs. Jackman and Jamieson have just finished taking out 123 sacks of ore which has been packed down to the road ready for the teams. They are working this mine on a lease. The Night Hawk is a mine which has become celebrated by reason of rich developments unearthed in the past ten days by its owner, George Bowers, and the two men in his employ. The strike in this mine was made in the face of the tunnel, which is in about 160 feet, and in which we were shown a streak of horn-silver ore from 4 to 18 inches wide. Mr. Bowers told us that an average sample taken across the ore streak in its widest part, 18 inches, assayed 700 ounces in silver to the ton. Mr. Bowers has about five tons of this class of ore sacked for shipment. The Rip Van Winkle is another good claim adjoining the Night Hawk, and on which we found Messrs. Sample and Jamieson putting in both time and muscle with good results, if seven inches of ore showing horn silver all through it, is worth anything,

The present developments consist of a tunnel about 50 feet long which tips the ledge, and from the end of which two drifts have been run on the ledge, one of which is in 20 feet and the other 16. It is at the end of the 50-foot drift that the good ore is now coming in. The Alpha is well-known as one of the best ore producers in the Wallapai district. Messrs. Cole and Caffrey have just finished cleaning out the 50-foot level preparatory to stopping, and large shipments may be expected from now on. The work of stopping commenced last Thursday. A carload of ore has been shipped from this mine in the past ten days.

RICH STRIKE ON THE PROSPERITY.—Mohave Co. *Miner*, Sept. 20: Of all the rich strikes ever made in this county, and there have been many such in the past 15 years, none can approach in magnitude or wealth that made about a month ago by Capt. Layne on the Prosperity mine in Todd Basin, about three miles from Mineral Park. This claim was located about six or seven years ago. The assessment work has been done regularly on the claim since that time but nothing more, until the past year, during which Capt. Layne has prospected it pretty thoroughly, and taken out several lots of ore which have paid him well. The last work done on the claim previous to the rich strike just made was done by Mr. James Jackman under a lease. He sunk a shaft about 20 feet deep and run in a short cut from it into the hill, but not obtaining any immediate results he gave it up and surrendered his lease. About six weeks ago Capt. Layne concluded to sink that shaft a few feet deeper, and after going down just two feet from where Jackman left off, struck the vein of ore which has widened to such an extent that it is, beyond doubt, the finest body of ore ever opened out in the county. At the point where Capt. Layne first struck the ore the ledge took a turn and the character of the country rock changed, showing that the real ledge had been covered up by surface deposits. When the ore was first uncovered the streak was only a few inches wide, but it soon widened out to two feet, and then to three. About that time Capt. Layne began to think he had struck something good, and sent in for his partner, Caldwell Wright, Esq., who went out and took a number of samples for assay. These samples assayed so high as to cause some doubt as to their correctness, and more were taken and assayed with the same result. Mr. Wright then determined that he would ship what ore he had on the dump, which amounted to seven tons, and it was accordingly sacked up and sent to Pueblo. In a few days Mr. Wright received a dispatch stating that his ore had sampled 221 ounces in silver and one ounce in gold. Then, and not till then, did Mr. Wright believe in his good fortune. After paying all expenses of packing, teaming, freight and smelting charges Mr. Wright received a little over fourteen hundred dollars for the first seven tons of ore shipped from the new discovery. In the meantime Capt. Layne and one other man continued sinking the shaft, and after going down some ten feet more the ore body widened out to the full width of the shaft, having gained a foot and a half in width in ten feet. About ten days ago another shipment of about 20 tons of the ore was sent over to the Kingman Sampling Works, and while it was not expected that it would go as well as the first shipment, the returns are extremely satisfactory to the owners. While we are not permitted to give the exact value of this shipment, and of another one made last Monday, still we have no hesitation in stating that the last shipments have averaged very close to \$150 per ton.

COLORADO.

A. P. TUNNEL.—Georgetown *Courier*, Sept. 24: The tunnel is being pushed ahead with a determination that looks like the owners mean business.

SHIVELY.—The lessees on the Shively, after having done a great deal of dead work, are now working upon good ore.

INCREASING OUTPUT.—The mines on Red Elephant mountain are said to be out-putting more ore at the present time than for several months past.

MINT.—Two lots of ore from Harris & Co.'s lease on the Mint were marketed last Saturday, the first class returning 248 ounces and the second class 188 ounces silver per ton.

SNOWDRIFT.—Dawson & Crimmon milled some ore last week from the snowdrift, which ran at the rate of \$824.41 per ton for first-class and \$101.70 for second class, over and above mill charges.

BALTIMORE.—Jacobson & Co. made a good strike a few days ago, opening up ore that returns about \$600 per ton. Another party also made a strike one day last week, over which they are highly elated.

SEVEN-THIRTY.—The mine has been shipping about 40 tons of ore to the Stanton concentrators for a trial run the past week. About the same amount has been treated from the Centennial with satisfactory results.

CAPITAL.—A company of experienced mining men is placing the Capital mine in condition for operation. The hoisting machinery has been repaired, and the workings are now being cleaned out. Good ore is exposed in the mine.

RICH STRIKE.—A strike is reported in a property adjoining the Winning Card worked by a Mr. McCrary. It is said that he has opened up a six-inch streak of ore that will mill run on an average 1000 ounces silver per ton. Chicago capitalists are back of the enterprise.

ALASKA.—Judge Henry Seifried and Mr. J. A. Fish, owners of the Alaska lode on Griffith mountain, have commenced work upon it after over 15 years of inactivity, during which time the workings have become filled with debris caused by cavings. J. H. Woodard and John Taylor are employed cleaning out the upper adit, preparatory to sinking. A large streak of low-grade pyritiferous ore is exposed.

TERRIBLE.—About 50 men are employed on this mine. The work of retimbering and putting the mine in good working condition, which has been pushed for a number of months passed, will not be completed for several months. In the meantime new ground is being opened and a number of lessees are receiving good returns for their work.

ROMBAUER PLACER.—Judge Rombauer of St. Louis, has commenced to clean up his hydraulic placer above Empire, which has been operated steadily all summer. The results last year were very large, but he believes this year's clean-up will excel all previous ones.

RED ELEPHANT.—H. A. Mears, the superintendent of the Red Elephant Co.'s mines, informs us that the main work is being done through the Schwartz shaft on the White. The most important lease is that of Van Syckle & Co. on the eighth and ninth levels, at the Junction of the Boulder Nest. They are stopping above the eighth level on from six to ten inches of good grade ore, and drifting under the same block of ground on two streaks of ore, one on either wall. A carload of this ore was shipped last week, which milled 150 and 100 ounces in two classes.

IDAHO.

ANOTHER BONANZA IN SMOKY.—Wood River *Times*, Sept. 26: Sam, Allen, who returned yesterday from Smoky, reports a recent strike of 2½ feet of rich ore on the surface in O. C. ground, which William Watt, J. O. Swift, Geo. Montgomery and himself recently purchased. The find is opening out splendidly, and proving so large that a shipment of one carload has already been made. This lot will be in next Sunday. If it samples as well as it looks, the owners have a bonanza. They are only working four men there at present, but if the ore pays they will employ quite a force all winter.

OVER THE RANGE.—The Vienna mine employs at present about 60 men, the ore output is good, the mine showing well all through. The mill is expected to start up this week and lively times are anticipated. Talking about the Vienna Company, they deserve great credit for the enterprise they display in developing this valuable property. Mr. Johnson, the superintendent, George Francey and the various foremen connected with the mine are live men, up day and night if necessity requires, and kind and generous to their men. The Lion claims to have struck a body of fine ore lately, and the only thing we regret is that a lawsuit exists between the Lion and Vienna, which, we hope, will be settled amicably. The Solace M. Co. is working but a few men and will probably quit working altogether this winter. The Emma is working several men and will probably work six or eight men all winter. Both of the latter mines show well for the country. The Morning Star, a fine-looking prospect over on South Boise and east of the Emma, looks first-class, an ore body of nearly two feet of fine ore being in sight over 60 feet below the surface. This mine, it is rumored, will in a short time be sold to Eastern capitalists.

GOLD IN THE GRAND PRIZE.—Houston *Press*, Sept. 23: Since the finding of gold in the Big Copper mine the ore being shipped from the Grand Prize mine has been assayed for gold and gave such favorable returns that it will not be very much of a surprise if the mine develops into a paying gold property. The assays made were from ore taken out about 50 feet below the surface. The Grand Prize is only a short distance from the Big Copper and the owners will sink and explore for the yellow material.

MONTANA.

THE ELM ORLU.—Inter-Mountain, Sept. 20: The Elm Orlu, which six months ago was regarded as a comparatively valueless prospect, became suddenly prominent by the discovery of a surface bonanza of very rich ore which development proved to be permanent. It is opened by two shafts, one 60 and one 90 feet deep, and has been during the entire summer a steady producer of high grade silver ore. It was owned by Messrs. Clark Sigbee & McNamie. The latter's one-fourth interest was purchased a few days ago by Mr. W. A. Clark, and the deed was signed yesterday. The consideration was \$10,000.

BUTTE.—*Miner*, Sept. 23: During the past week the usual amount of work has been done in the mines of this district, the usual quantity of ore has been extracted from the mines and reduced, and our reporter, in his regular weekly rounds among the mines yesterday, noticed the average smile of satisfaction on the countenance of every mining man he met. The general response he received in making the inquiry as to the present condition of the mines was: "Oh, as usual." We might sit down and write columns on the present condition of the mines of Butte, but one look at some of these magnificent properties would convince the most sceptical person in the world that our mines are the richest and most permanent ones in the world. They are simply immense and a person who is fortunate enough to be a part owner in any of the mines of this district may well consider himself a lucky person.

THE MIDNIGHT MINE.—The Midnight is located between Walkerville and Centerville, close to the Lexington mine; and is claimed by the Silver Bow Company. The mine is at present worked under lease by Messrs. Charles and C. H. Rule, John and Pete Doble and Amford. These men are sinking the main shaft that is now down 58 feet. The shaft is going down on the ledge. A drift is being carried in on the 40-foot level, also on the ledge. The ledge varies in width from 6 to 18 inches, and assays well in silver. When the shaft is down 75 feet a horse which will be erected on the property. A large quantity of ore of good grade was seen on the dump, and the boys are well pleased with their lease.

THE ALICE MINES.—Work at the mines of the Alice company is being carried on in the usual manner. The mills are kept running with the ore extracted from the Alice and Magna Charta mines and the machinery at the mines was never in a better condition. The work of building a new carpenter shop was commenced at the Alice yesterday. The north and south crosscuts at the 800-foot level of the Alice are in more favorable ground for driving, and the ledge will be struck in the south crosscut in a few days.

GOLDSMITH NO. 1.—This mine is a veritable bonanza. The new body of ore recently discovered on the 130-foot level is opening out in all directions. It extends down to the 300-foot level and a continuation of it has been found in several other places of the mine.

MINOR NOTES.—The Anaconda mine looks better with every day's work done on it. Prospecting is being carried on at the Amy Silversmith with considerable vigor. Everything at the Rising Star mine is in good condition and the stopes are producing the usual quantity of ore. The Wild Bill looks grand, and the lucky lessees are reaping a reward

for the large amount of "dead work" they did on the property. The Moulton mine never looked better, and ore extraction is about the same. Every thing at the mine and mill is in good order and Superintendent Clark never looked happier.

THE MOULTON.—Inter-Mountain, Sept. 26: Active operations are progressing in the Moulton, where, after a lapse of about two years, sinking has been resumed in the main shaft. In the upper levels the stopes are in good shape and producing the usual quota of ore.

NEW MEXICO.

WATER CANYON.—Socorro *Bullion*, Sept. 23: John J. A. Dobbin is developing the Star of Bethlehem. The Maria, owned by Col. Roy and F. Vanderhaar, is dumping pay dirt. The Jane Bowman concentrator is running day and night, Sundays excepted, to its full capacity. The Jane Bowman is being worked with full shifts, and large amounts of ore are being dumped at the mill. The Las Vegas & St. Louis Mining & Smelting Company are deepening the shaft on the Nineveh gold mine, on pay ore. The Nichols Manufacturing Company of Denver, have just completed a concentrating mill for the Jane Bowman mine. The plant consists of a double Giant stamp mill and Rouse concentrator, and it is reported as being an immense success.

MAGDALENA DISTRICT.—The Hardscrabble mine is shipping ore to the Hilling smelter. The Kelly, Juanita, Graphic and Hardscrabble are in full operation. Several important negotiations are pending, involving the sale of a number of well-known and important Magdalena properties. At 15 feet, J. S. Hutchason recently reached a fine gold pay streak on a claim which is situated near the Brittenstene properties in the Pueblo district. Hutchason and Romero will commence to ship ore from the Ambrosia this week. The tunnel in this property, made to intersect the ore body is completed.

LADRONES DISTRICT.—Whitacre is still sinking on the Florence, and dumping very fine ore. Donald McRae has finished his assessments and is now at work with a strong team on the Lawrence, dumping high grade ore.

MISCELLANEOUS.—There is now a greater demand for mining property in Socorro than there has been since the exciting days of '81. Prof. Hill informed a friend of ours not long ago that the richest ore he had ever received came from Socorro county. Work and development is the order of the day, in the Water canyon, Pueblo and Magdalena camps, and all the boys find ready employment at good wages. H. R. Harris, one of the most reliable of our mining men, has returned from an extended trip through Magdalena, Pueblo and Water Canyon camps. He announces a great improvement in the outlook, and that work is progressing satisfactory in all of our neighboring camps.

OREGON.

A NEW DISCOVERY.—Grant's Pass *Courier*, Sept. 24: We are told of the discovery of another rich quartz ledge below the Yank on Rogue river. Our informant, Mr. Trimble, says it is quite rich in gold, and that parties who have tested it say it is better than the Yank. The ledge has been traced for several miles and they have named it the "General Grant." The Trimble brothers have taken three claims and others are becoming interested in this new discovery. We expect to get more definite returns from the ore shortly, and hope the boys have found a bonanza. N. C. McNair, of the Yank mine, tells us he has tested the ore from this discovery, and that it gives promise of being very rich in gold.

UTAH.

SANDSTONE MATTERS.—Southern Utah *Times*, Sept. 20: The strike made by Wilson & Phelps, on the north extension of the Barbee & Walker, last week, is the most important discovery that has been made in the Silver Reef sandstone deposits for a long time past. It is situated on the White Reef, which crops out plainly for over 1300 feet on the claim, the easterly end of the property being covered by a deposit of gravel and granite boulders which have washed down from the Pine Valley mountains during past ages, and covered over the reef. The White Reef, before it leaves the Barbee & Walker ground, begins to curve towards the east, so that the ledge on the extension appears on the surface in a bow shape, bending gradually from a northeasterly to an easterly direction. The claim is an old location and considerable prospecting was done on it in the past, but the ore found was of too low a grade to pay for working. About 30 feet from the ledge on which the late strike was made and running parallel to it, is a strong, copper-stained ledge which carries a small percentage of silver, assaying from 3 to 15 ounces per ton. It was on this ledge that all the work was done heretofore, while the ledge in which the ore was discovered last week, although cropping out plainly a few yards away, was never before touched by a prospector. The ore was struck on the surface about 1000 feet east of Main street, on ground that was trampled over by hundreds of chlorides and prospectors since the Reef was discovered. The ore is a soft, iron-stained sandstone carrying horn and native silver specimens of which will assay up into the thousands. A fair sample of the paystake, which is five inches thick, assayed 153 ounces, while the whole ledge no doubt carries a good percentage of silver. The formation is the same as that in the Tecumseh, Savage, California and other mines on the Buckeye Reef in which was found the richest ore. The scene of the late strike has been visited by all the leading mining men and experts in the camp, and the universal opinion is that it is one of the biggest and best strikes that has been made in the Silver Reef country for years past. It is the first time that this information and this character of ore was found on the White Reef, and is a pretty fair indication that the best ground in the Barbee & Walker, Bonanza, Leeds and other properties on that Reef remains to be prospected.

OTHER NOTES.—Both the Christy and Stormont Companies are working a full force of men in their mines, and are crushing 40 and 45 tons of ore each, every 24 hours. Within the past week several rich strikes have been reported from different parts of the camp, and, notwithstanding the depreciation in the price of silver, of late, a very hopeful feeling seems to prevail among our mining men.

This cut represents our
**IMPROVED
 HYDRAULIC
 MACHINE.**

IT DIFFERS FROM THE OLD STYLE IN HAVING ONLY ONE JOINT instead of two. It is of greater capacity and more easily worked and kept in repair. The statement of Mr. Hendy that all styles are infringements on the machines made by him, he knows to be utterly false. All litigation has been in reference to old style two jointed machines, which are superseded by our new style one jointed. The decision of Judge Sawyer, referred to by him, is carried up on appeal to U. S. Supreme Court, with absolute certainty of a reversal in our favor. Send for Circulars and Price List.

State University, Berkeley—Second best display of variety of pears, \$10. Sonoma county—Second best display of variety of apples, \$19.

A Handsome Premium.

The publishers of this paper have had printed on fine paper and handsomely bound, a neat little volume, entitled "A Beautiful Poetic Review and Friendly Offering." It was written by Dr. J. R. Bradley, orator of Oakland Council, American Legion of Honor, and read in short sections by the author at different meetings, eliciting much praise from his listeners. The work is embellished with fine lithographic portraits of several noted poets whose writings are mentioned in the work. We believe the book will prove a pleasant and attractive keepsake in every family—it can be so readily taken up and read as leisure moments may occur. It will be mailed for 25 cents to subscribers (old or new), upon paying 12 months in advance for this paper. Or to those who pay one year and three months in advance we will send this beautiful souvenir free, postpaid.

THE GOLDEN GATE PLUG CLOSET is the latest improved form of plug closet which has been brought before the public. While economical in cost, its construction and operation are as perfect as the most expensive appliances of the kind. It is of good design and a thoroughly sanitary appliance, because it has a perfect airtight overbat. No sewer gas can pass through the closet either when it is in action or not in use. All real seats on the closet are made of brass. The valve is as simple and desirable as can be attached to a water-closet, and is operated by one extra heavy copper float. This closet is manufactured in this city by Joseph Budde, whose advertisement appears in another column.

THE SAN FRANCISCO Passenger Agents' Association has completed an organization which embraces all passenger agencies. The election for secretary and arbiter resulted in the selection of Sheldon Borden. It was agreed that the maximum commission to Chicago shall be \$2 and \$3 to all seaboard points, including European points; \$2 on all points east of Chicago, but not seaboard points, and \$1 on all Mississippi river points. It was decided to allow no commissions whatever to points on the Missouri river.

PHOTOGRAPHS.—We have received from E. K. Downer some photographs taken by D. F. Evans, of Downville, Sierra county, one of which shows the Mountain Messenger office. A printing office embowered in foliage is not a common thing to see. It makes a city journalist envy his brethren of the interior when he knows they can do their work in a building like the Messenger's surrounded by flowers and trees.

Beautiful Poetic Review, handsome, entertaining and instructive souvenir of real merit. 25 cts. .50

Send for any further information desired. Readers will please inform their new neighbors and others concerning our paper and these offerings. On application, sample copies of this paper will be mailed free to the address of any persons thought likely to subscribe.

The owner of a kiln at Auburn, Placer county, has discovered that mining slickens is the very material needed with which to make good brick.

ASSESSMENT NOTICE.

Orleans Mining Company.—Location of principal place of business, San Francisco, California. Location of works, Grass Valley, Nevada county, Cal. NOTICE is hereby given, that at a meeting of the Directors, held on the 17th day of September, 1885, an Assessment (No. 12) of Five (5) Dollars per share was levied upon the capital stock of the corporation, payable immediately in United States gold coin, to the Secretary at the office of the Company, 934 and 936 Mission street, San Francisco, Cal. Any stock upon which this Assessment shall remain unpaid on the second day of November, 1885, will be delinquent, and advertised for sale at public auction; and unless payment is made before, will be sold on Monday the twenty-third day of November, 1885, to pay the Delinquent Assessment, together with costs of advertising and expenses of sale.

GEORGE P. THURSTON, Secretary.
OFFICE—934 and 936 Mission St., San Francisco, Cal.

SAN FRANCISCO CREMATION CO.

[INCORPORATED SEPT. 5, 1885.]

CAPITAL STOCK, \$25,000, divided into 500 shares of the par value of \$50 each.

217 Shares Have Been Taken.

The remaining shares are now offered for sale and may be subscribed for at the office of GENERAL H. A. COBB, 321 Montgomery St., where further particulars may be obtained; also at the office of the Secretary, 100 Battery St. By order of the Board of Directors.

MAX LEVY, Secretary.

HOOD'S FOUNDRY COKE.

Consumers are respectfully informed that owing to inferior brands of Coke having been sold in this and other countries under the name of "Patent Coke," the Glamorgan Coal Co. (Limited), Cardiff, in May, 1884, abandoned the title of "Patent Foundry Coke," substituting that of "Hood's Foundry Coke."

This Coke is exclusively used by the Selby Smelting and Lead Co., Union Iron Works, Professor Thomas Price, and other consumers here. Large quantities are regularly forwarded to Copper Smelters in Arizona and New Mexico, and also to consumers in Nevada and Salt Lake.

The undersigned are the SOLE IMPORTERS of the above Coke, which is for sale in quantities to suit purchasers.

SAN FRANCISCO, CAL.

JENKINS PATENT VALVES.

Gate, Globe, Angle, Check and Safety.

Manufactured of BEST STEAM METAL. We claim the following advantages over other Valves and Gauge Cocks now in use:

1. A perfectly tight Valve under any and all pressures of steam, oils or gases.
2. Sand or grit of any kind will not injure the seat.
3. You do not have to take them off to repair them.
4. They can be repaired by any mechanic in a few minutes.
5. The elasticity of the Disc allows it to adapt itself to an imperfect surface.

In Valves having ground or metal seats, should sand or grit get upon the seat it is impossible to make them tight except by regrinding, which is expensive if done by hand, and if done by machine soon wears out the valve, and in most cases they have to be disconnected from the pipes, often costing more than a new valve. The JENKINS Disc used in these Valves is manufactured under our 1880 Patent, and will stand 200 lbs. steam. Sample orders solicited. To avoid imposition, see that Valves are stamped "Jenkins Bros." PLANTS FOR GOLD AND SILVER MILLS,
embracing machinery of LATEST DESIGN and
MOST IMPROVED construction. We offer our cus-
tomers the BEST RESULTS OF 35 YEARS' EX-
PERIENCE in this SPECIAL LINE of work, and
are PREPARED to furnish from SAN FRAN-
CISCO or CHICAGO, the MOST APPROVED
character of MINING AND REDUCTION MA-
CHINERY, adapted to all grades of ores and SU-
PERIOR to that of any other make, at the LOWEST
POSSIBLE PRICES.

We are also prepared to CONSTRUCT and DE-
LIVER in COMPLETE RUNNING ORDER,
in any locality, MILLS, CONCENTRATION
WORKS, WATER JACKET SMELTING
FURNACES, HOISTING WORKS, PUMP-
ING MACHINERY, ETC., ETC., of any DE-
SIRE CAPACITY.

WATER JACKET SMELTING FURNACES

For COPPER and ARGENTIFEROUS LEAD
ores of NEW and ORIGINAL DESIGNS, covered
by LETTERS PATENT. No other Furnace CAN
COMPARE with these for DURABILITY, and in
CAPACITY for uninterrupted work. MORE
THAN 150 of them are now RUNNING in various
parts of THIS COUNTRY, as well as many in
FOREIGN COUNTRIES, giving results NEVER
BEFORE ATTAINED as regards CONTINUOUS
running, ECONOMY of fuel, AMOUNT and QUAL-
ITY of BULLION produced. These CLAIMS have
been PROVEN BY RESULTS in ANY NUM-
BER of INSTANCES, and the GREAT SUPE-
RIORITY of this SYSTEM of smelting ores DE-
MONSTRATED BEYOND QUESTION. COM-
PLETE PLANTS furnished to order of any CA-
PACITY, with ALL IMPROVEMENTS that ex-
perience has DEMONSTRATED as VALUABLE
in this class of work.

Beyond question the cheapest and
most effective machine of the kind
now in use adapted to all grades and
classes of ores.

This machine has been THOROUGHLY TESTED
for the past TWO YEARS, under a GREAT VA-
RIETY of CONDITIONS, giving most EXTRA-
ORDINARY results FAR IN ADVANCE of
anything EVER BEFORE REALIZED. A re-
cent COMPETITIVE TEST at the Carlisle Mine in
Mexico, showed an ADVANTAGE OF OVER 30
PER CENT in favor of THE DUNCAN. The
amount SAVED OVER THE TRUE being suffi-
cient to PAY THE ENTIRE COST of the ma-
chines EVERY MONTH of the YEAR. One
of its MOST VALUABLE features is as an AMAL-
GAMATOR. It saves all THE AMALGAM GOLD
and SILVER that ESCAPES THE BATTERIES,
PANS or SETTLERS, making the machine worth
MORE than ITS COST for THIS PURPOSE
ALONE.

Baker's Mining Horse Power.

Possessing all the requirements of a first-class hoist,
and affording means for the continuous operation of a
Pump or Blower, without interfering with a hoisting ap-
paratus. It is made entirely of iron, no piece weighs
over 300 pounds. At the ordinary speed of a horse, a
1,000-pound bucket of ore may be raised 120 feet per
minute. The hoisting-drum is under the complete con-
trol of the man of the shaft, and is capable of carrying
500 feet of five-eighths steel rope. SEND FOR CIRCULAR.

Breech-Loading Shotgun Ammunition.

The Chamberlin Automatic Cartridge Loader.

Shotgun shells of the same interior capacity, when loaded by hand, are found to vary in their finished lengths, which is, of course, evidence that the wads are not level, or that the quantity of powder or shot varies, so that constant pressure is not used in ramming the charges. Unequal results must necessarily follow, much to the annoyance of shooters. The measurement of powder and shot in the usual way varies more or less. Shaking by hand does not always level the charge to even the wads squarely on the surface. It is impossible to always put the wad down perfectly in the shell by hand. Many trust to the rammer to level it as it goes down, which the rammer fails to do, and a weak-shooting cartridge is the result. Then, the degree of pressure upon the wads varies, it being found impossible to secure uniformity of hand pressure in this respect. Careful examination of a hand-loaded cartridge will reveal its defects.

A very ingenious machine for loading cartridges has been invented, and the right for its use on this coast has been purchased by the Selby Smelting and Lead Co. The defects of hand-loaded cartridges are all remedied by the Chamberlin machine, which insures the sportsman perfect accuracy in the load, and will also save him much time and trouble. The machine-made cartridges are now being placed on the market under the brand of "Standard." Of course all sizes are made, and for any kind of shooting. Each cartridge is perfect, since the machine automatically sorts and tests each shell, discarding all imperfect ones and refusing any or all which may vary from the correct size.

This machine is one of the marvels pertaining to the development of the science of modern gunnery. It is so constructed as to perform all the operations of loading shells with absolute accuracy, giving uniform charges of powder and shot and uniform pressure upon the wads, and with any desired number of wads. Each wad is inserted in the shell separately, with such pressure upon it as may be wished, and forced home in an absolutely level position, an advantage that cannot be secured in the hand-loaded article. The rammers are graduated and adjustable to any desired pressure up to 100 pounds, so as to obtain the highest explosive force without crushing the powder.

An engraving of this automatic loader is shown herewith, and is precisely like those used by the Selby Co. in preparing their new brand of cartridges. The machine is not very large, but is a very ingenious piece of mechanism indeed. The empty shells are placed in a guide or trough, and as the machine is revolved, they drop one after another into a small receptacle formed for to catch them, and each shell becomes part of the mechanism for this time being. That this is so is shown by the fact that if no shell drops into the pocket, no powder, wads or shot are fed in, while if the shell is there the different parts perform the functions for which they are intended.

As the shell drops into the little pocket, with the open end up, the powder from the glass receptacle, shown in front and on top of the machine, drops into the charge shown below it, and the fixed charger into the cartridge from said charger. This charge of powder is accu-

ately measured and is subject to graduation. It goes into the shell, to which a jar or shock is imparted, so as to level the powder smooth on top.

As the machine revolves, the powder-loaded cartridge next comes under a plunger which forces down a pasteboard wad upon it. The wad is tapped or tamped by a slight blow. The next plunger forces down a pink-edge wad upon the pasteboard; which is followed in turn at the next plunger by another pasteboard wad. Then the cartridge comes under a spout from which

One of the engravings shown herewith is a sectional view of one of the cartridges loaded by this machine. The Selby Company are now making 43 different varieties of loads to suit all game, from sandpipers to geese, and can load any fancy lots which may be ordered at short notice. This is an immense advantage to the gun trade, for dealers having the Selby S. and L. Company to draw from need keep no large stock of material, on which they never realize much profit. These shells are guaranteed to keep perfect in any climate for ten years, and

THE CHAMBERLIN AUTOMATIC SHOT-GUN CARTRIDGE LOADER.

the charge of shot comes, and, as it goes round, another pasteboard wad comes on top of that. All these wads are seated uniformly and evenly, and there is an even pressure on each, something that cannot be accomplished by hand. When the last wad is in, the cartridge is reamed smoothly, a stamp marks the number in the end, and the completed cartridge drops into the box ready for packing.

Since the machines were built, Mr. Prentiss Selby, the Superintendent of the Selby Co., has improved the ramming or crimping attachment materially, so that the edges are hard and smooth and is never broken or ragged. Each load is stamped by an automatic machine with the size and all this work is done delicately and accurately at the rate of 1000 an hour for each machine. Recognizing the large investment they have at stake, the Selby Co. use only the very best material in every respect, and owing to the automatic arrangements, no inferior grades could be substituted.

we have fired off an Ely paper cartridge pin fire for a Lefauchau gun which had lain in a drawer for more than a dozen years. The desire of this company is to so make their loaded shells that their standard character will be recognized by shooters, who will always be able to get the same quality at all times.

They have built a large cartridge factory close to their huge smelting and refining works at Vallejo Junction. Seven of the automatic machines were put up and are now in use, and more machines will be put up as soon as needed to meet the large demand for these cartridges. In this factory every part of the work of loading a shotgun cartridge is done by automatic machinery, and in this the Chamberlin cartridges differ from other so-called machine cartridges, which are simply hand-made cartridges filled with an automatic filler, but rammed, wadded and reamed by hand, thus possessing none of the essential advantages of the all-automatic machine-made goods. The super-

iority of the Chamberlin cartridges, arising from the fact that all this work is done by accurately gauged automatic machinery, is obvious. Hand-rammed cartridges cannot be uniformly pressed, but the automatic machine loaders, graduated to a hair's breadth, coming down on every load with equal pressures, must of necessity do uniform and perfect work. This machine is necessarily exactly accurate in the charges of powder and shot, and shooters using the Chamberlin cartridges, so soon as they have got the gauge of their ammunition, can depend upon every succeeding load firing as the other did. Another feature is that the cartridges loaded by the machine are sold for much less than the old-fashioned hand-loaded ones.

The Cable Road Boom.

There appears to be a veritable cable road boom in the East. New York, Philadelphia, Chicago and Kansas City have already each a road in operation. Chicago has been ahead—as she usually is in all new enterprises. The road in that city has been a success from the start, the projectors having been wise enough to come to San Francisco and pattern after the successful roads here. The other cities named have been trying something new, and, as they claim, better than the "Western ideas." The consequence is that they are having rather a hard time of it, but there is a prospect that they will finally succeed in getting their roads in good running order after remedying their mistakes and paying dearly for their new fangled notions. With the "boom" in cable roads naturally follows the "boom" in inventions. Up to this time over 300 patents have been taken out for cable railways; about 100 of which were for "grip" alone. The natural result of this patent business will be endless litigation. We presume there was one original inventor of the cable system, and we have no doubt he will receive his just reward in the end. He is entitled to it, and we hope he may not have to wait too long.

In this connection our attention has been called to a "perfect cable road, which solves the traction problem," as described in the *New York Mail and Express*. In the description we can see nothing new. It is so like the roads built in this city that we fail to see where the saving of three-fourths in the art of construction comes in. One feature is that of having two cables, one running fast and the other slow. With this complication of two cables in each tube, the cost very naturally would be much greater and with no material advantage, as the delays from the breakage of cables is reduced to a minimum. The double cable system is now being tried in New York, on the Tenth Avenue cable line, where they will have a fair test of its advantages after a year or two's experience. We have our doubts about working the remaining cable should one break in a tube, as the broken one will be very apt to interfere with the grip. With proper care the life of a cable can be closely gauged, and a new one put in at night, causing but little, if any, delay in the traffic of the road. After an experience of over ten years of successful working there has been no call for a double cable system in this city.

The first engine ever used on a mine at Calico has just been put up. Over \$2,000,000 in bullion has been produced there, and no hoisting apparatus other than the common windlass.

Discovery of Californian Gold.

Address Delivered Before the Society of California Pioneers, Sept. 9, 1885, by John S. Hittell.

Prominent California Inventions.*

And yet, if we should regard only such associations and traditions as are of local character, though we have none of ancient date, such as we have are extremely interesting. Our history, though brief, is full of wonder. Indeed, it is a common expression with pioneers of 1849 that here, within 36 years, they have witnessed a greater number of exciting events of a peaceful character than have been seen elsewhere in a century. Their experience has been so different from anything told in the records of other countries, that they sometimes feel disposed to doubt whether the facts of their memory are not fictions of the imagination. They saw the time when California was almost a desert; when wild Indians were a majority of the inhabitants of the Sacramento valley; when most Californians and San Franciscans lived in tents; when John B. Weller stood up in the National Senate and said that his State had no agricultural resources worthy of note; when for lack of coin gold dust was common currency, and every merchant had scales for weighing it; when, later, the coin most in use for large payments was the octagonal slug worth \$50; when not 15 years since the dime was the smallest coin in common use; when the introduction of the half dime and the five-cent nickel—now our smallest coins—were regarded by the poor generally as hateful evidences of an approaching era of low wages and small profits; when there were not 10 acres of level ground in this city east of Larkin and Ninth streets; when ships anchored east of Sansome street between California and Pacific; when wild ducks were frequently killed in a pond on Third street between Market and Mission; when the only road from Portsmouth square to the Mission, passable for loaded wagons, had a toll gate on Kearny street near Sutter; when most of the merchandise in the city was stored in dismantled ships at anchor in the bay; when gold mining gave employment, directly and indirectly, to four-fifths of the men in the State; when the leading branch of agriculture was the breeding of beef; when the California Steam Navigation Company and the California Stage Company carried most of the inland travel; when business was thrown into confusion by the decline of the gold yield; when the city and State were threatened with abandonment on account of the supposititious discovery of very rich and very extensive placers in the basin of the Fraser river; and when the people were astonished and delighted by the opening of speedier and cheaper channels of communication with the Eastern States, and by the development of numerous branches of mining, agricultural and manufacturing industry. We who can look back over such memories can never say that life here has been dull and unromantic.

The promptness with which the gold discovery followed the American occupation was an indication of the marvellous energy that was to mark all the steps in the growth of our State. The treaty of peace between the United States and Mexico was not signed until February 2, 1848, and the ratification, which finally determined the allegiance of California, did not occur until May 30th. The Americans had scarcely obtained undisputed possession of the country before they threatened to swamp the markets of the world with their gold, and then in rapid succession they poured out immense quantities of quicksilver, wheat, wool, fresh fruit, canned fruit, silver, and horax. They competed with Lucra in the quality of olive oil, with Malaga in raisins, and with Agen in prunes, and are hoping to surpass Smyrna in figs, and France in wines. No pre-eminence is safe from them.

I have spoken of the deep impression with which we have stamped the seal of our enterprise into the topography of the continent, leaving marks which the storms of thousands of years could not efface. Thrown into a wild country, where every appliance of a civilized life had, speaking in an industrial sense, to be created out of nothing, it would have been sufficient for our credit to use skillfully the arts of older communities in supplying our material wants. But we did more. Our work has not been exclusively muscular; our brains too have been busy. We stand alone in having codified all the branches of our law. The only Political Code, legally enacted, is that of California. In many departments we have made strenuous efforts to surpass whatever had been accomplished elsewhere. As poverty here often culminated in wealth, so sometimes ignorance had the laudable ambition of rendering signal service to science. The most skillful workmen of Europe were employed for years before they succeeded in casting the lens of the largest of all refracting telescopes for the Lick observatory, and the gift of funds for the construction of such an institution at a considerable altitude above the sea supplied with instruments of high power; but since Lick's death Italy and France have both built observatories at high elevations.

Our books are read, our pictures admired, our engineers employed, our machinery im-

ported and our inventions copied by distant lands. The productions of our literary and artistic talent have been made familiar to the general public by frequent mention and elaborate criticisms in the periodical press, but those of our inventive genius—not less creditable to local capacity, and far more important to the world at large—have received far less attention. The main responsibility for this neglect rests, however, in the inventors themselves, who have not placed the needful information within reach of journalism, and have even allowed false claims to pass without contradiction. California's inventions are so remarkable for their number, variety and ingenuity, and have contributed so much to the industrial wealth of the world, that our State has no better claims to the respect and admiration of her own citizens and of other communities. I shall here make a brief list of them, confining my attention to those approved in practical working, and destined to be adopted in all parts of the world where their respective branches of the useful arts are understood in their highest development.

The best methods of handling water in shallow and deep placers is entirely Californian. Here most of them were first invented, and all were carried to the highest perfection. The board sluice, known in other lands in ancient times, was reinvented in Nevada county and made far more effective than ever before. Hydraulic washing, the process of using a stream of water under pressure to loosen an alluvial auriferous gravel, first invented in the same county by Edward E. Matteson, was afterward improved by globular joints to connect the nozzle with the pipe, deflectors to enable one man to turn a nozzle 10 inches in caliber under a pressure of 400 feet, internal feathers to keep the stream from twisting and scattering, and many other devices. By the help of Matteson's invention at least \$500,000,000 have been added to the world's stock of gold in California. Delmar, misinterpreting Pliny, makes the mistake of asserting that hydraulic washing was used in ancient Spain, but Pliny's language does not imply anything beyond the ground sluice, a much inferior process.

By hold experiments the early hydraulic miners ascertained that sheet iron pipe would bear a much greater pressure of water than the engineering authorities recognized, and that by dipping it in coal tar at a temperature of 400°, it could be protected against oxidation for a long time, and its inner surfaces could be smoothed so that a swifter current would run through it. The pipes were enlarged and used as inverted syphons to carry water across ravines several miles wide, the greatest pressure being 1000 feet, equivalent to 770 pounds to the square inch, whereas 200 is high pressure in a steam boiler. These remarkable pipes were supplied with lead-covered joints, hydraulic gates to check or stop the flow, and cocks to let out air at the high points and to let out water at the low points, by the ingenuity of Joseph Moore and Francis Smith.

The machinery of the best quartz mills of our time owes its present form, in nearly every important feature to Californian ingenuity. The old square wooden stamp has been superseded by the revolving iron stamp, the cylindrical stem of which is lifted by a double arm cam with a single hub acting on a gibb tappet, both cam and tappet having received their present shape from Irving M. Scott, of this city. The simple mortar used before 1849 for all stamps, has been differentiated here into three patterns, one for gold, another for the dry crushing of silver, and third for the wet crushing of silver ores. The capacity of all the mortars has been increased and their expense diminished by self-feeding apparatus, first invented by C. P. Stanford, and since improved by others. Several valuable rotary pulverizers of Californian origin are in use. In gold mills much of the precious metal is caught on sheet copper covered with quicksilver. A Californian, whose name is not on record, plated his copper with silver with so much benefit that his example has been followed in all gold mills.

The method devised by John Reynolds for separating gold from silver in bars containing not more than 20 per cent in weight of the former metal, has entirely superseded the older process, and has an important place in refineries of the precious metals.

The systems of silver amalgamation used in Germany and Spanish America were so slow, and required so much manual labor, that the miners of the Comstock, at the beginning of their work, made an urgent appeal to the Californian metallurgists for some expeditious labor-saving process, even if a smaller percentage of precious metal should be obtained. Their want was supplied by the Washoe pan, first used in Almarin B. Paul's mill, and then made an unquestionable success by Zenas Wheeler's grinding shoe and guide-plate; but years of experiments, with pans that did nothing but grind, and others that did nothing but amalgamate, elapsed before the evolution of the grinding and amalgamating pan now used in all American silver mills. The Washoe pan has been the chief agent in separating \$500,000,000 of precious metal from its ores. Continuous feed into connected pans, a great improvement on the older system of feeding by separate charges into separate pans, is due to the ingenuity of N. P. Boss, who also devised the automatic method of handling quicksilver, an important matter when 60 tons of that metal were used and handled every day in a single mill. The hydraulic pressure of amalgam was introduced by W. H. Patton. The best roasting furnace for gold sul-

phurets and base silver ores was made by Wm. Bruckner; and the best water jacket for copper and lead smelting furnaces was invented here. The chemical process of separating gold from sulphurets was taught by Plattner in Germany, but it was of no metallurgical value in California, and of little elsewhere, until O. F. Deetken, in Grass Valley, devised an economical apparatus for its application.

The best hoisting machinery owes much of its excellence to Behr, Patton, Eckert, Amss, Dickie and Scott; and with their help rock is now raised from the lower levels of the Comstock lode, where a depth of more than 3000 feet has been reached, at a speed of a mile a minute. Among the notable improvements are the direct action of the engine, and new methods of indicating the position of the cage and of unclutching and braking reels. A. S. Hallidie, of San Francisco, was not the first person to construct a wire ropeway for the transportation of ores, but he was the first to use a single-moving rope and fix a load to it, thus employing gravity as a sufficient motive power on mountain slopes.

Of all deep pumps, the most remarkable was devised by George W. Dickie and Joseph Moore, for the Crown Point combination shaft. Driven by a column of water 1600 feet high, above the Suto tunnel in which it is placed, and pouring out 10,000 tons of water daily, lifted from a depth of 800 feet below the tunnel, it is as wonderful for the ingenuity and holdness of its design as for the handling of columns of water aggregating nearly half a mile of vertical pressure. Mr. Dickie has also invented a valve valuable to control the supply of steam to the cylinders of marine engines.

The pump-dredge of Alexis P. W. Von Schmidt, our fellow pioneer and ex-president, is the most important improvement of our century in the dredging business. In situations where low land within a mile of the dredge is to be filled in, it saves at least 50 per cent, as compared with any other dredge. It will greatly add to the value of mud flats or swamps in and near city water fronts that need dredging.

Pelton's hurdy-gurdy wheel makes a practical use of 86 per cent of the theoretical power of water under high pressure, and is a great improvement over any wheel previously devised.

Another revolutionary San Francisco invention, but of older date and of world-wide fame, is the cable tramway of A. S. Hallidie. It has been introduced into Chicago, Philadelphia, New York, London and other cities, and has made an epoch in the transportation of passengers. It has also been the mother of a multitude of supplementary inventions covered by 300 patents or more, relating to cable crossings, turning corners, grips, brakes and cable tubes. By a combination of cylinders and stops, Edward T. Sten adapted the hydraulic press to the raising of large and heavy buildings, the level of which was preserved, no matter what the inequalities of weight in different ends or sides.

The best system of blasting rocks under water, accessible by shafts or tunnels, was devised by A. W. Von Schmidt, and first applied by him at the Hunters' Point dry dock and Blossom Rock, in this city, though afterward used at New York without due credit to him.

The first series of connected time-pieces, driven from a central source of power, with trustworthy regularity, were the pneumatic clocks of Hermann J. Wenzel, copied in Europe, but the copyists there took the honor of the invention to themselves.

One of the most important improvements of our half century in the sawing of lumber, has been the adjustable saw-tooth, first invented by N. W. Spanning, and afterwards modified and improved in many ways. It materially increased the efficiency of saw-mills and diminished their expense. The head block for feeding the logs to the saws, the gang joist machines and the gang lathe machine of J. A. Rohh, have come into extensive use. By combining a circular saw working from below with another cutting from below, and a third from the side, D. Evans manages to convert a log 11 feet through into lumber, though neither saw can make a kerf more than three feet deep. The immense trees of our State—and logs 18 feet in diameter are handled here in the ordinary course of the lumbering business—required novel machinery for handling the logs, and John Dolbeer's steam logger moves them to the water or to the car used in transporting them to the mill. G. W. Swan's wood-slicing machine cuts logs into sheets more expeditiously and with less waste of material than the saw.

The telephone was a wonderful product of human ingenuity, but it had little influence in business until G. S. Ladd, in this city, connected the separate telephone lines in an exchange, and after the lapse of nine years the American people have more capital invested in telephone exchanges than in telegraph lines after 40 years. Mr. Ladd is also the inventor of the improved messenger box in common use, and with Stephen Field of the double electric machine, which rendered mechanical electricity available for ordinary telegraphic purposes.

Byron Jackson's horse-fork, portable derrick and threshing-machine have much reduced the expenses of harvesting grain in California; and the first successful straw-burning engine was that of H. W. Rice.

This hasty summary of the leading inventions of California omits much, explains nothing fully and is far from doing justice to the industrial genius of our State, but, unsatisfactory as it is, I challenge every other American State, even the most populous, to show a more re-

markable list within the last 35 years. It adds to the confidence with which I congratulate you on your lucky venture in becoming pioneers. I close with the remark that after looking far I have come to the conclusion that nowhere is there a community in which the people generally are more intellectual and better, or more respectful to the moral dignity of their neighbors than here, and that no other place offers to me a more enjoyable life than San Francisco.

Note.

The following are some authorities for facts mentioned in the address:

"The Life and Adventures of James W. Marshall, the Discoverer of Gold in California." By George F. Parsons, Sacramento, 1870.

"Hutchings' Magazines." San Francisco, 1857. (Containing, at page 193, Vol. II., statements of Marshall and Sutter.)

"Handbook of Mining." By John S. Hittell. San Francisco, 1862. (Containing the substance of a statement by Isaac Humphrey.)

"The Commerce and Industries of the Pacific Coast." By John S. Hittell. San Francisco, 1882. (Containing descriptions of some of the inventions mentioned.)

"Mining Industry." By James D. Hagus. Washington, 1870. (Containing history of Washos pan.)

"Hydraulic Mining in California." By A. J. Bowie, Jr., in press. (Containing a history of hydraulic mining and its processes, and much information about pipes for the conveyance of water under high pressure.)

Manufactures in San Francisco.

An Address Before the Manufacturers' Association by A. S. Hallidie.

This position of the manufacturer in San Francisco is somewhat unique. While he has a great many advantages, he likewise labors under many difficulties and disadvantages, and a careful man will consider with greater care the possible difficulties than the positive advantages of an enterprise. He knows that success is more often secured by an appreciation of difficulties existing, or that may develop, rather than a knowledge of the advantages that are visible to the eye of the common mind.

Every member of this association is familiar with the natural advantages of the location, surroundings and climate of San Francisco in respect to manufacturing, but it is possible that every member may not have considered the position of the manufacturer who has invested his means, cast his lot and taken on the harness in this city as a manufacturer or manufacturing merchant, and the conditions and circumstances that influence his enterprise in the direction of success or failure, and which are outside of his mode of managing his own affairs, with which I do not intend to deal, except so far as to assume that he does business in a business way with honesty and integrity.

In the first place let us consider how far

Our Geographical Position

Affects the manufacturer. We are situated on the margin of this great continent, 2500 miles west of the nearest manufacturing town of importance in the United States, with no greater town than our own for an equal distance to the north or south of us. At this time the only important raw materials we produce profitably are the precious metals, cereals, fruits and timber, so that it may be stated in a general way that nearly all the raw materials needed in manufacturing have to be imported. Now the importing of raw material, to be manufactured up into the finished goods is a very different thing to importing the finished goods. Raw material will not stand as high a rate of freight as the latter, but must be transported at the minimum of cost over the cheapest highway, by the most economical means. This, of course, means transportation by sea, in vessels of large capacity, propelled by favorable winds, and delivered on good wharves in a safe harbor.

It will be at once recognized that the above conditions exist here, that we possess them all, save and except that the harbor charges are not included in the minimum figure. But the distance from the great marts of the world to San Francisco by sea exceeds 15,000 miles, and the voyage occupies an average time of about 135 days by the routes now followed, the shortening of which by canal I will refer to later; hence, the manufacturer depending upon these marts for his principal supplies in the ordinary course of business, has to calculate on the lapse of seven months on an average from the time his order leaves the office to the time his goods reach him. He has no adjacent place of supply to draw from, as New York from Philadelphia or Boston or Pittsburgh, and hence has to keep a stock larger than his immediate wants require, so as to provide for the contingencies of trade; and unless his goods are shipped from important points like New York or Liverpool, doing a large business with San Francisco, he is again subject to delay in shipping.

But, on the other hand, freight rates by sea are not subject to very great fluctuations, on account of the legitimate competition existing in the sea-carrying trade, and because there can never be the concentration of interest or pooling as may be possible in the railroad interests.

Sea Routes and the Harbor.

I can conceive of nothing that San Francisco should guard with greater care and vigil-

*Continuation of address in last week's Press.

ance than her sea routes, her harbor and her water front. If her people should permit those to decay who would indeed be helpless; for, however beneficial the railroad may be, and however great a necessity it is to a commercial center like San Francisco, without the means of communication and transportation by sea she would be an absolute slave to her masters controlling the railroad system. And, again, American mercantile marine, by a combination of circumstances for which we are not to be blamed, and could not control, have been largely driven off the sea, and there remains to us only our own coasting trade; and this remains not by the laws of trade, but by the laws of Congress, for without those laws which reserve domestic commerce by sea to domestic ships, foreign ships would long since have monopolized this trade. Thus, it may be said that the ships sailing between New York and San Francisco furnish the only means of keeping up our supply of trained sailors, and any weakening of or blow at this nursery would be a national disaster eminently conspicuous in case of war; and the attempt to lessen the efficiency of this service (by compelling the withdrawal of freight, or by any other means) is unpatriotic and repulsive to the best interests of the nation.

So, in like manner, the coast routes should be maintained and encouraged—their maintenance means the maintenance of a navy, the nurturing of hardy seamen, and efficiency in seamanship, so that in time of trouble we may be better able to defend our coast that stretches over so many long miles on the Atlantic as well as the Pacific ocean.

Inland water navigation, although protected by national laws has, as a general thing, become subservient to railroad competition, and between these two interests there is an irrepressible conflict, and excepting where rivers connect important towns with the sea by deep channels, the conflict has generally resulted in favor of the railroad.

Portland and Los Angeles.

The peculiar conditions which exist to-day with respect to the trade of San Francisco with Portland on the north, and Los Angeles on the south, require some explanation, and from a manufacturer's standpoint, some consideration. The statement is about as follows: Los Angeles, 482 miles by rail or 411 by sea (including 22 miles by rail) receives its principal supplies overland from St. Louis and Chicago, 2500 miles distant, and points east of these two cities; but up to the completion of the Southern Pacific R. R., used to draw its supplies from this market. The freight charges overland for the 2500 miles from Chicago to Los Angeles being, say \$20 per ton, and for the 482 miles from San Francisco to Los Angeles \$23 per ton for the same class of goods by rail, or \$8 per ton measurement by steamer.

Portland 661 miles by sea and river navigation from San Francisco, is, by the completion of the Northern Pacific Railroad, in as easy communication with Chicago and other Eastern cities as Los Angeles, and receives the larger proportion of its supplies from these Eastern points, the rates of freight being the same as from the East to Los Angeles, or from the East to San Francisco, these three cities, Los Angeles, Portland and San Francisco, being on exactly the same footing as far as freights carried overland from the East are concerned. Portland, however, seems to have been favored by the railroad corporation in the peculiar arrangement of "reshipped" rates made by them in favor of those merchants who have imported their goods once over the lines of the company, and as a discrimination against importers by sea, or by other routes than their own. For instance, if the local rates from Portland to Cheney is \$1.50 to a reshipper it will be about .90 and so on. Now, although the steamers running from San Francisco to Portland are controlled by the same railroad company, shippers by these steamers are not entitled to reshipped rates. The San Francisco importer by rail has no advantage over the Los Angeles or Portland importer by rail. On the contrary, the Portland man has an advantage over the former, as I have just shown; but on the other hand the San Francisco importer by sea has an advantage over both, as he lands his goods directly at the wharf by large ships in a deep and safe harbor. Los Angeles having a landing, where goods have to be lightered ashore, 22 miles from that city, and Portland being situated on a branch of the Columbia river 120 miles inland from the sea, where ships of limited capacity have to cross a dangerous and difficult bar, and to be towed 120 miles against a strong current up an uncertain river and its tributary.

The Canadian Pacific Railway

Will have upon the affairs of this coast, and of this State in particular, is of course a matter of conjecture at present, but as that road is nearing completion and will probably carry passengers and freight by next May, it is evident that the policy of the Government of the Canadian Dominion, which virtually controls its management, will be decided before very long. That the road will carry passengers at a very cheap rate in order to settle up the country there can be no doubt, and also that every inducement will be extended to shippers to carry freight over that road. Arrangements for through passenger and freight rates by steamer from Europe via Canadian ports to the Pacific and way stations will be consummated, and opportunities for storage of foreign goods in Victoria, Vancouver Island, at very reasonable rates, will induce American merchants on the Pacific Coast to use that port as a storehouse. While the great body of immigrants will probably

not be content to remain in British Columbia but will move farther south, and as it is not likely the Canadian Pacific will enter into any pool or combination with the other transcontinental roads, I do not see but that the completion of that road will be of advantage to the people of the Pacific States.

For 25 years the policy of Congress has been to develop

Internal Navigation and Transportation.

To this end it has subsidized in the most liberal manner by actual money gifts and land grants, nearly all the important lines of railroads constructed in the country during that period, as well as many canals and wagon roads, and it may not be generally known that the number of acres of land certified to, or patented by the U. S. Land Department up to June 30, 1884, is as follows:

	Acres.
For aiding construction of railroads.....	47,994,044
" " " " " canals.....	1,124,073
" " " " " wagon roads.....	1,741,898
Total.....	50,860,015

While the number of acres granted by Congress for the construction of railroads, only part of which has been patented as shown above, far exceeds this: to the Pacific railroads alone being over 58,000,000 of acres.

In addition to these grants, there has been paid by the general Government in money subsidies about \$65,000,000 to aid in construction. This may be said to be an out-and-out gift; as under the Act of 1864 the first mortgage bonds held by the United States to secure these advances were practically retired by permitting preference bonds to be issued by the railroad corporations for an equal amount.

Thus if we take the net proceeds of the lands patented to the railroads, wagon roads and canals at \$2.50 per acre, it will realize \$132,925,037.50. Aided the amount paid in subsidies in money \$64,561,320 will give a total of \$197,486,357.50, or say in round figures 200,000,000 in 20 years or 10,000,000 per year.

Of course the effect of such profuse liberality on the part of Congress has been to develop energetically and rapidly the construction of wagon roads, railroads and canals, but almost exclusively in railroad construction, and consequently in distributing population throughout the country, expanding and developing enormously the resources of the nation. But this office having been performed by Congress, whether wisely or not time will determine, it is not likely that there will be any more occasion for public assistance being extended to the further development of the internal system of communication and transportation, and that the time has about arrived when such financial aid as may be needful to develop and maintain an external system of communication and transportation, will be extended by Congress in a wise and liberal manner so that American mails and American freight will be transported in American ships.

At this time we are threatened with the suspension of the American line of steamers to Australia, and the American line of steamers running between this port and foreign ports south, have refused to carry the mails because one of the officers of Government has put his own interpretation as to the intention of Congress in appropriating \$400,000 toward mail service at sea, by refusing to so appropriate it, and this in face of the fact that during the past year over \$18,000,000 were paid for carrying the mails inland, less than \$300,000 were paid for the transportation of mail by sea! The joint protest of the commercial and industrial associations of this city has been ineffectual in obtaining any remedy, and we thus are brought face to face with other difficulties in the way of extension of trade.

External Commerce.

While, as before stated, the large sum of nearly \$200,000,000 has been placed in the lap of speculation and enterprise in developing internal commerce, Congress has steadily refused any liberal assistance toward developing external commerce. And while it is the part of wisdom to strengthen and fortify our possessions so that by a complete system of rapid inter-communication and transportation we can resist foreign invasion by internal defenses and develop internal commerce, when that is fairly completed we should turn our host thoughts and our abundant means to the development of trade commerce and communication with foreign nations, and realize some of the profits that the internal commerce of the country invokes from abroad, by being carriers of our mails, passengers and freights; and by the acquisition of a mercantile marine capable of doing this, do more by the protection of American commerce on the high seas and the protection of our shores from foreign aggression.

In this connection I wish to say that one of the conditions under which such assistance should be granted is that freight rates should be limited to a certain amount per ton per mile of water traversed.

Ship-Building.

In times of commercial and industrial depression it is the duty of Congress to attempt to relieve that depression by the adoption of such measures as will stimulate industry and develop commerce. The expansion of our foreign trade has been very great, but it will be still greater if we can command the carrying trade now almost wholly controlled by foreign powers.

The impetus that would be given to almost

every branch of manufacture by the construction of a navy of merchant steamers adapted for Government use in time of war, and intended to carry the mails, passengers and freight in time of peace, would be incalculable and enduring.

The construction by private enterprise of such a navy would result from Government aid judiciously extended to external transportation, and which, while not requiring the vast amounts already expended by government in inland or internal transportation, would result equally as advantageously to the nation and supplement the great railroad enterprises of the past 25 years. And how unanswerable is this statement when we remember that the value of the railroads in the United States is 7500 millions (seven billions five hundred millions) of dollars, while the whole value of our shipping employed in the foreign trade is only 38 millions!

Manufacturer and Merchant.

The permanent benefit to the country from manufacturing does not depend upon the bare fact of manufacturing, although it carries with it the idea of employment and industry; for if the employment and industry thus understood is not remunerative to those employed as well as to the industry itself, such manufacturing had better cease, for the extraction from the laborer of the maximum of labor for the minimum of compensation results in the degradation of industry and blunts the self-respect and independence of the laborer.

As before stated the distance from San Francisco to Portland by water is 661 miles, and by steamer the freight rates are \$4 per ton, while Los Angeles is 411 miles distant from San Francisco and the freight rates are \$8 per ton, the difference being accounted for by the transportation company by charges for lighterage, \$1.50 per ton and rail for 22 miles, \$2.50 per ton, both of which are excessive.

Previous to the completion of the transcontinental railroads to these two points, all the territory now supplied from Portland and Los Angeles received its goods from San Francisco, as well as a large amount of territory which is not now supplied from either of these two points. When we consider this fact and what it involves with relation to the importer, it will be readily understood why there is a restriction of business in this city, and the mere importer cannot hope to extend the area of his transactions, except so far as they are influenced or controlled by cheap water freights.

The Manufacturer and the Merchant.

The manufacturer, however, is in a better position than the importing merchant, because if he manufactures on an average at the same cost as his Eastern competitors he will be able to sell as cheap, but until we produce or obtain the raw material consumed in manufacturing as cheaply as our competitors, there will be the difference in first cost of raw material to add to the finished article. Hence, the raw material being imported must pay the lowest freight rates, which will be, as before stated, by sailing vessel. Thus every consideration of this subject brings us back to the very great importance of keeping open our water routes, and to encourage ships to come not only with freight but for freight.

There is no doubt, with freights at say \$5 per ton on raw material, manufacturers in San Francisco should be able to send their goods over the interior railroad lines as far toward Chicago as the difference between sail freight and rail freight, that is to say, with freight from Chicago to San Francisco at \$20 per ton for 2500 miles. We may add the additional cost of the manufactured article when it exists to the transportation charges, or say, make the freight \$25 as against \$20, and there would be that proportion of difference against us in the distance we could ship toward Chicago, which would be 1111 miles against 1389 miles.

If then, with freight rates by rail the same out from San Francisco as they are in to San Francisco, the San Francisco manufacturer, on the \$1 per 100-pound classification, should profitably supply all that country included within the circle having 1111 miles for its radius, wherever there is a railroad connected with this city, and on the higher classification, or freight rates, this distance would be increased in proportion (and, in fact, in some instances, this has been done).

I cannot conceive that any other policy should guide the railroad companies whose lines run out from this city where they are left free to their own business judgment, for if it will pay to transport goods at a fixed rate for a fixed distance from New York or Chicago to San Francisco, it will also from San Francisco to New York or Chicago.

It must be admitted, however, that there is a disposition in railroad companies to go outside their legitimate business, and by their great power, and through the greed of individuals connected with such corporations, especially during construction of new lines, to ruin and build up communities and towns as the interest of the corporation or its officials may dictate (Yakima and Tacoma being illustrations on the Northern Pacific railroad), the exercise of which naturally creates an antagonism to these corporations where there should be a friendly feeling; and incites the passage, by legislatures, of laws regulating fares and freight which should be left to the laws of trade or a general national law, based upon experience and fair dealing.

Having so far considered the condition of our trade with Portland and Los Angeles as they

exist, and recognizing the fact that our relations with Portland are at present on a more satisfactory basis than with Los Angeles, let us first see if there is any

Remedy for the Los Angeles Difficulty.

The distance between San Francisco and Wilmington (Los Angeles' harbor) by sea is 392 miles. Freight is carried by steamer to Portland, 661 miles, for \$4 per ton, regular rates, or \$3 per ton, contract rates. At the latter figure, by the rule of proportion, the charge from San Francisco to Wilmington should be \$1.75 per ton. The lighterage charges from the anchorage to the wharf should not exceed 75 cents per ton, and this latter charge will be obviated when the Government improvements are completed. Then comes the short road owned by the Pacific Company, 22 miles to the city of Los Angeles, with its charge of \$2.50 per ton, which should not be over 4 cts. per ton per mile, or say 88 cents. This would bring the total charges for transporting goods from San Francisco to Los Angeles by this route, \$3.41 per ton, and competition would, without doubt, bring it down to that figure, or perhaps less. This would, in my opinion, place the San Francisco manufacturer in the Los Angeles market.

Looking again at the railroad charges from San Francisco to Los Angeles, 482 miles, if for this distance the same proportion was paid as from Chicago, the rate of freight on the 1-cent classification would be \$3.85 per ton.

Referring again to Portland, there can be no doubt as to the desirability of having direct railroad communication with that point. The Pacific Company, I have every reason to believe, have made their arrangements for the early completion of this line, and which will give them an unbroken connection from New Orleans to Portland via San Francisco of 3250 miles, and from Ogden to Portland via Sacramento of 1483 miles; but it remains to be seen how far their policy will favor San Francisco. Under a fair arrangement, it will open up a large and desirable intermediate country to the local manufacturers.

Inter-oceanic Canals.

The consideration of this subject having, I think, conclusively proved the great value of water navigation to San Francisco as it exists to-day, that conclusion naturally suggests the thought as to how far and in what manner that great marine highway can be improved and made valuable to us. It is evident that the solution of this suggestion comes in the shortening of distance and consequently time, by means of a ship canal across the American continent; and the influence the construction of such a work would have upon the manufacturing and commercial interests of this city can scarcely be exaggerated.

Whether this canal should be constructed across the isthmus at Panama or through the Nicaraguan Republic, or across the Republic of Mexico at Tehuantepec, has been the subject of much discussion. The fact of the Panama Canal having actually been commenced, gives it prominence, especially as it is under the management of such a distinguished canal engineer as De Lesseps and backed apparently by inexhaustible capital, but it is a work that necessarily will take a great deal of money and time, the difficulties being enormous and the sphere of operation comparatively restricted. On the other hand, Nicaragua seems to present a natural although longer route for a canal, and an opportunity exists for its construction by American capital and its control by American influence, that should recommend it to the American people. This may also be said of the Tehuantepec scheme, which is proposed to pass through the Republic of Mexico, and which presents some engineering peculiarities worthy of consideration. Each of these schemes has its strong advocates, and comparisons are drawn between each as to its value and practicability. I must confess, that I attach but little weight to the denunciation of Mr. Eads' ship railway, for I believe in its practicability. Yet it is better for the people of the United States to concentrate their influence in favor of but one project which shall be emphatically controlled by a national policy emanating from this country. All these projects involve very large amounts of money—Panama about \$350,000,000, Nicaragua, \$120,000,000, Tehuantepec, \$80,000,000. And the fact that one of these enterprises has already swallowed up about \$150,000,000, and probably \$500,000 have been expended in preliminary work on the others, shows the importance attached to water routes by commercial nations, and is additional evidence in favor of our guarding with jealous care the water routes now existing. What effect the completion of

No one will deny the right of the mechanic or laborer to earn more than enough to eke out a bare living. His labor should be invested as capital yielding an interest over and above the investment, so that food may be provided, rents paid, clothing bought, schooling furnished, taxes met, reasonable luxuries enjoyed, and a certain percentage set aside for a rainy day. To the careful and thrifty this should not be denied; to the thriftless and the shiftless this cannot be supplied.

Convict Labor and Corporations.

We are coming more and more to face two facts—the increasing power and influence of wealthy corporations, and the conflict of convict with free labor. The former, if misdirected, may become dangerous and antagonistic

(Concluded on page 254.)

Passing Events.

The scant supply of water in the mountains is troubling some of the mill-men and miners, but the river-bed miners are profiting by it. Some quartz mills have had to shut down and will not start up till the rains come.

Lake district, in Nevada, is the scene of a gold excitement, some very rich rock having been found about 12 miles from Hawthorne.

Although Bodie is supposed to be very dull, and is dull, yet the mines have produced \$103,-865 during the past three months.

In many mining camps assessment work has already commenced, as the miners do not care to jeopardize their claims by delaying the necessary work to hold them, till the last hour.

OUR SUBSCRIBERS are reminded that the present is a very good time to renew their annual favors. The heavy expenses we have incurred this year in moving, fitting up new offices, composing end press rooms render any little pecuniary offerings in the shape of subscriptions very acceptable. The long winter evenings will be better enjoyed by all who have a clear conscience in the matter of their newspaper subscriptions. We always feel more encouraged to improve the paper when appreciation in this form is apparent.

THERE are now in progress in California fourteen railroads, with a total projected mileage of 604 miles. The most active work during the past six months has been prosecuted on the Atlantic and Pacific extension.

Placer County Mines.

Pleaser, one of the oldest of the mining counties of the State, has been coming to the front during the last few months with discoveries and developments that are attracting considerable attention among mining men, the more so, perhaps, that the prevailing impression has been not only that Placer county did not contain any mines of consequence, but that it could not. That the great system of buried river channels, blue leads and hydraulic banks that lie on the western slopes of the Sierras, rich in gold from Sierra county on the north, to Tuolumne on the south, either skipped Placer county entirely or were too barren or spotted to justify the investment of capital and working on a large scale. That the great quartz mother lodes and systems, well-defined, permanent and rich in the precious metals in Nevada and Sierra counties northward and Amador and Calaveras to the south, did not exist in Placer county: instead only shallow, narrow veins, perhaps containing an occasional rich pocket, but no great milling properties that could be worked with certainty of return to a thousand and more feet in depth. That these views are incorrect is now appearing by the irrefutable logic of accomplished facts that cannot be set aside by mere theories, arising from the failures of mismanaged mining enterprises ten years since. The placers of this county, that is, the deep buried blue gravel leads, form a very intricate system, the unity of which over large areas is just beginning to be understood by the miners. Without going into a detailed description of this blue lead system of gravels, it is sufficient to say that the workings of 30 years have practically left untouched the main great gold bearing channel, to which most of those known and worked already are only tributaries. This great channel was first struck about four years since in the Mountain Gate mine at Damascus, found to be very rich, but only workable under great disadvantages. It was next found four miles to the south in the Turkey Hill mine two miles from Michigan Bluff, the gravel rich in gold, but mined under great difficulties. The third strike and the most important is that in the Mayflower mine at Forest Hill. In this mine the prospecting work had been directed for this channel, and its discovery was not the result of accident as in the two former noted instances, but of science, faith, persistence, and not less than these, money. The mining in this mine is very expensive, but the gravel found is wonderfully rich in gold: so much so that the monthly yield of gold since the last of May, when the strike was made, has averaged over \$50,000. Within the last few days a fourth strike has been made in the Excelsior mine a mile and a half south of the Mayflower; how extensive sufficient developments have not yet been made to determine. These four discoveries have practically outlined the course of the channel for 15 miles, a greater continuous extent of unworked placer mining ground having every indication of extreme richness than is possessed by any other mining county in the State. The mining claims in the range of this channel have naturally much appreciated in value under these strikes, and in many of them active work is being done toward reaching the gravels of the golden river.

In quartz mining, as in gravel, there is also a revival based on the developments and discoveries of the last few years. Sections of the county in which the ledges have been considered barren of gold have been found to contain some most promising lodes, which are being slowly developed into mines. This is particularly the case with the Last Chance, Bald Mountain and Emigrant Gap region, where several strong veins of high grade ore have been found and opened during the past summer. In the vicinity of Auburn and Ophir also there is an increased activity, based on legitimate grounds—the discovery of large bodies of milling ore in several of the largest mines. It should be borne in mind in considering the quartz mines of this county, that the work done is hardly more than prospecting; there are only three shafts down to greater depths than 350 feet, and in the one of these three which could have the most influence on the development of a district—the St. Patrick at Ophir—the mismanagement and stock-jobbery wrecked this mine and gave the mines of Placer county a setback from which they are just beginning to

recover. There is no doubt but that honest management and scientific mining can bring Placer county close to the first in annual gold yield and dividends, instead of the seventh place it at present holds.

Scarcity of Water.

The whole State of California is this year suffering from scarcity of water. The main rivers are lower than they have been for years, and many of the smaller streams and water-courses have almost entirely dried up. One of the characteristics of the coast is the fact that many large streams are filled only in winter. Others, again, run until this fall and then dry up. But this year streams which usually run all the year are now dry. The writer recently made a trip through Sonoma and Mendocino counties, and there many of the water-courses are very low. In many instances springs that had flowed constantly since settlers could remember [had stopped running]. The larger Mendocino rivers were exceedingly low, a circumstance interfering greatly with lumber milling interests. In the interior of the State the same condition of things exists. There is comparatively little rainfall in the mountains last winter, so the supply of the springs and streams has fallen short. Many of the mining and irrigating ditches have a scant supply of water and in others it has given out altogether. This has, of course, caused the closing down of many mines. The hydraulic miners, not being allowed to work their claims, have not stored up the winter water, but allowed it to flow off from the reservoirs and this has had an effect on many streams and rivers.

The scarcity of water has affected the lighthouse department of the Government on this Coast. Facilities for supplying the different lighthouses up and down the coast with water, because of their situation, necessarily limited. An unusual amount of water is required to generate steam to keep the fog signals going. Within the past month it has been found necessary to send a water-boat to Santa Barbara, Monterey, Santa Cruz, Goat Island and Mare Island. Now a famine in water is hourly looked for at Point Reyes and Point Bonita, and should it not rain within a week or so it will be found necessary to stop the signals at both those points. Bonita depends on a creek and well for the water supply. The former is already dry and the latter almost so. An attempt will be made to hoist water from a water-boat, but as this will have to be done through a hose up a cliff 150 feet high that it will be accomplished is a matter of conjecture. Last week the signal there had been kept going constantly 140 hours—an unprecedented length of time. There is nothing strange in fog continuing for twenty-four hours, or thirty-six hours, at a stretch. Point Reyes depends solely for its water on the rain supply, there being only one other way of getting water there, and that is by laying pipes for eighteen miles from the foothills near Oleme.

During the past few days the weather has been such as to lead people hereabouts to expect rain, but it has not come. Still, as we are so far along in the season that a good rain may be expected at any time.

The New Star in Andromeda.

The newly discovered star in the nebula of Andromeda is just now a topic of interest among astronomers. A short time since Prof. Davidson described it before the Academy of Sciences and gave directions where it could be found. Since then he has made frequent observations. On Saturday last he examined the new star when the atmosphere was moderately quiet and there was no moonlight.

With a magnifying power of 100 diameters the star was quite as sharp as those near the nebula; but the nebula was apparently much brighter than at previous observations. This may be on account of the clearness of the atmosphere. Prof. Davidson thinks the star had almost exactly the same brightness it had two weeks before; it certainly was not brighter. He examined the star with eye pieces of 150, 300, 400 and 500 diameters. The object was starlike with the power of 300, but the disturbance of the atmosphere was now magnified and rendered the star also unsteady. This appearance was unsatisfactory with this higher power on this or the neighboring stars of the same magnitude.

The Manufacturers' Association.

A very important meeting of the Manufacturers' Association of California was held last week, with President A. S. Hellidie in the chair. Mr. Geo. C. Hickox, the Secretary, read a very complete report of the progress of the association since its origin in October, 1883. His reading closed with the announcement that the meeting had been called to discuss matters of vital importance to the manufacturing interests of California.

President Hallidie then read a carefully prepared and important address, which we give in full on page 242 of this number of the Press.

Patronize Home Manufacture.

T. S. Clark presented the following resolutions that were adopted:

WHEREAS, The growth and prosperity of our city and State are dependent upon the profitable employment of industrious men and women; and whereas, the retention and circulation of money on this coast are seriously retarded by the purchase and use of imported goods and articles to the detriment of similar articles manufactured here of equal quality and price, and believing that our citizens do not realize the disastrous and serious condition which thereby results both to the employer and employed, be it

Resolved, That we earnestly appeal to the thoughtful consideration of the residents and citizens of the city and State requesting that they will purchase such goods as are made here, and use their influence wherever possible to the same end, giving preference to home-made goods of equal quality and price.

Ocean Mail Service.

In regard to the ocean mail service, Isaac Hecht presented the following resolutions, which were unanimously adopted without discussion:

WHEREAS, We are threatened with a suspension of steam communication with New Zealand and Australia, and believing it cannot but be disastrous to the interests of this State and city and humiliating to the dignity of the commonwealth; and whereas, Congress at its last session appropriated \$400,000 for the transportation of our ocean mails, and, fearing if the present interpretation of the law is enforced it will cause great hardship and depression upon the industries of this coast, be it therefore

Resolved, That we respectfully and earnestly request the Honorable Postmaster-General to reconsider his decision in withdrawing the appropriation and hereby curtailing the commercial facilities with foreign countries, which the community have heretofore enjoyed and benefited by.

WHEREAS, The Government of New South Wales has appropriated \$150,000 annually for the continuance of mail service between this country and Australia, be it

Resolved, That we deem the suspension of steam communication between California and Australia as a misfortune and greatly detrimental to the interests and convenience of the people of the Pacific States.

Resolved, That it is wise, patriotic and desirable that regular and prompt delivery of mails from the United States abroad should be by American ships, and we appeal to Congress to take such steps as will accomplish this purpose.

Convict Labor.

On one of the subjects referred to in the President's address—convict labor—Mr. William T. Garratt offered the following resolutions, prefacing them with an argument against employing convicts in labor that would affect outside mechanics.

WHEREAS, There is a growing tendency on the part of State Governments through false motives of economy and without regard to the condition and rights of the workmen and women of the country, to educate, farm out and employ the convicts and criminals in the prisons in various branches of mechanics, art and manufactures in competition with and underbidding free labor,

Resolved, That we earnestly protest against such employment of convict labor and pledge ourselves to use our best effort to discourage the same.

Resolved, That we petition our Senators and Representatives in Congress to pass such laws as shall restrict and prohibit the employment of convict labor in competition with skilled labor.

Resolved, That in the opinion of the Manufacturers' Association the convicts of the State should be employed, but at such employment as will not conflict with free skilled labor.

Appended to the resolutions was the following, headed as being the sense of the committee:

"Employ the convicts in such labor as getting out granite for use in the seawall construction and paving stones for our streets; also in grading city and State property, and generally improving and beautifying such as it will not pay to have done except by convict labor. Never was there a city so important to the commercial interests of the world as San Francisco, and with the material at its door, so lacking in its enterprise regarding its facilities for commerce. With a water front of from seven to nine miles in length, all of sufficient depth for the largest ships, we have not wharves or seawall sufficient for their accommodation. We have the finest of granite surrounding our State Prison at Folsom and belonging to the State. Why not utilize the prison labor for preparing this granite for the seawall so much wanted for the accommodation of our commerce? By having this seawall there would be a large amount of property just inside of it that would be brought into the market, thereby increasing

the revenue of the State by taxation. This is only one of the things that can be done by prison labor; there are many others that might be done without interfering with skilled labor."

Mr. Gregory P. Harte, who is connected with the San Quentin prison management, was present by invitation, and gave his views on the resolutions. His remarks briefly stated, were: "There are two classes of convicts incarcerated in the penitentiaries. The first and smaller class is that of criminals who have committed assaults on persons. The other class, which is by far the largest, is composed of men who have outraged the laws of property. The causes which have brought these people to the penitentiary are numerous, but the principal cause is neglect in early education. Now, there are two reasons why prisons are established; the first, no doubt, is to punish the criminals for outraging the laws, but the other should not be overlooked. It is to reform those prisoners and make better men of them. For that purpose they are taught trades and given the habits of regular work, and when they have finished their term of imprisonment they can go out into the world and battle in an honest manner for their living. Should that resolution be endorsed and its sentiment permeate the entire State the result will be that the prisoners will cease learning how to earn a living, and when liberated will be forced back among their old associates and mode of living, sooner or later to be again imprisoned for fines similar to their first offenses. When consideration is given the little competition they prove to skilled and honest labor, I am astonished that the question should be raised as one of such great importance. In the jute factory at San Quentin, for instance, four prisoners are employed at one machine, where, at the jute factory in Oakland, one girl, receiving a salary of \$9 a week, is found efficient to run two machines. So it is in the various manufactories, and certainly the work turned out at that rate by a few hundred men cannot be claimed to enter into serious competition with the work of a State."

Arpad Haraszthy declared himself in favor of the resolutions being adopted.

W. T. Garratt answered Mr. Harte in a forcible speech. He was not in favor, he said, of spilling sympathy over a lot of convicts. They were not ignorant, as Mr. Harte claimed. Some of the smartest and cutest men were among the convicts at San Quentin. There were more convicts on being released from prison, even with a trade at their finger-ends, who made a dishonest living by working harder than an honest one. He trusted that the resolution would go forth as the unanimous sentiment of the association. The resolution was not intended for this State alone, but it was desired that manufacturers all over the United States should take up the matter. He has known of work being sent East from here, and performed by convict labor and sold in the market here in competition with that done by free men. On the other hand, we do not want our convicts idled by any means, but we do not want them to compete with us when their expenses are all paid by us. I served seven years at my trade, and did not expect to come into competition with convicts. If I figured on giving my men 40 or 50 cents a day for their work, as I might have to do if competing all the time with convicts, I should deserve a coat of tar and feathers. The object of the resolution is not to make the convict idle, but to put them at proper work which will benefit the community. Why not set them at work on the seacoast. We pay taxes for it and for them. Put them to quarrying stone for the seacoast. We can employ mechanics to lay the stone after they make it. We have no passable roads out of San Francisco; set them at work on the roads. If I can have farmed out to me 500 men from the prison, I can shut up my brass foundry on this coast, and the same in other trades. The men should work, of course. They are put there to be punished, and given severe labor to do.

Mr. Isaac Hecht had his doubts about the resolutions, after hearing Mr. Harte. Boots and shoes were the first things made at the penitentiary, but men still make a good living at that in the city. The harness and other leather work the prisoners do is so small in quantity that they do not interfere with the work of free men.

Mr. Haraszthy thought Mr. Harte had pre-

sented the benevolent side only. We have to consider that 1500 prisoners are perhaps unfortunate in having had bad parents, but there are 100,000 people outside, however, who have resisted temptation. The prisoners, by carelessness or neglect, are sympathized with. How about the others? The prisoners ought to be put at good hard work.

Upon being put to a vote the resolutions were endorsed unanimously.

The Debris Question.

Mr. Denicke introduced a resolution to the effect that the representatives of California in Congress be requested to give their urgent attention to pushing the matter of having Congress take action in the debris question in regard to the filling up of the Sacramento river with the tailings from the hydraulic mines, and if possible to secure an appropriation to dredge the river.

Congressman Morrow, who was present,

stated that the delegation would do all it could in the interest of the people of the State in the debris matter. He said, though, that there was already a \$250,000 appropriation for the purpose lying idle, as the War Department refused to handle it.

William T. Garratt desired to make a few remarks on the subject for the purpose of showing that the slickens matter had two very distinct sides. He stated that it was true that thousands of acres of land along the Sacramento and San Joaquin rivers were rendered barren by debris from the hydraulic mines, but those mines

Improved Fifth Wheel for Vehicles.

John S. Klapperich & Son, of the Grand Avenue Carriage Factory, on Grand avenue, between Ninth and Tenth, and Howard and Mission, not long since patented, through the MINING AND SCIENTIFIC PRESS Patent Agency, fifth wheel for vehicles, which they are now successfully introducing. The main feature of the invention consists of a means for connecting the front axle and bolster, so that they can be turned about a central point, without the use of a king-bolt to extend through and weaken the axle.

By reference to the engraving the method of accomplishing this result is shown. The metal axle is secured to the wooden axle bed by clips in the usual manner. Upon the top of this bed in the center, is secured a wear-plate, C, having a short pin projecting upward from it. The bolster has a similar plate secured to it, and hav-

KLAPPERICH'S IMPROVED FIFTH WHEEL FOR VEHICLES.

ing a hole in the center, into which the pin extends, where the parts are in place together. The spring, shown in the engraving, rests upon the bolster and a plate, G, with lugs, H, projecting in front and behind, rests upon the spring and is clipped with it to the bolster by bolts, I, as shown. A plate, J, extends from front to rear beneath the center of the axle, and has rods or bolts, K, extending from it up through holes in the lugs H, of the plate G, where they are secured by nuts which screw down upon them.

The plate J has a cup L formed upon it, and another plate, M, is secured above it, beneath

FIG. 1.

FIG. 2.

SCORPION GOPHER TRAP.

were also of great enough importance to receive some consideration. He believed the affair could be settled in an easy and quiet manner. He was of the opinion that three dredgers could be put in the Sacramento river and two in the San Joaquin and that the debris they would dig up and dump into the tule lands and along the river banks would improve one and strengthen the other against the periodical overflows with which the valleys are threatened. "Let the slickens pour out of the Feather river as fast as it may come," said the speaker; "every cubic yard of it will be worth from three to five cents."

The meeting was well attended, and there was great interest in the proceedings.

THE MECHANICS' FAIR.—Superintendent Gilmore reports that the exhibitors at the recent fair numbered 390. The largest attendance was on the last day, when 19,976 people entered the doors. The expenses were \$334.96 daily for 29 days. Out of the fair receipts \$20,000 have been paid on the mortgage on the pavilion.

An Improved Gopher Trap.

Mr. A. S. Hallidie, of this city, well known for his various inventions in the system of cable railways, has patented through the MINING AND SCIENTIFIC PRESS Patent Agency a new and very simple form of gopher trap, which is shown in the accompanying engravings. This improvement in gopher traps consists of a pair of spring-arms having barbs or points at their outer ends, with plates or leaves having their outer ends hinged to the respective arms and their inner ends formed to meet and rest against each other to hold the arms apart. When the trap is to be used it is introduced into the gopher hole, with the barbed points opposite the other, and extending into the hole. When the animal comes out, forcing the pile of dirt before him, the pressure of the dirt against the plates forces them backwards about their hinges, thus allowing their spring arms to close and the barbs will impale the gopher.

The trap is set by simply compressing the springs by the hand as shown in Fig. 1 of the engravings. This separates the lower portions of the spring arms so that the hinged plates will drop into a straight line with each other. When the pressure on the arms is relieved, the central angular portion of these arms will come together so as to hold the arms apart, the trap being then set. Fig. 2 shows the trap set ready for use. The trap is then introduced into the gopher hole, with the barbed points standing opposite each other. When the animal comes out, forcing the pile of dirt before him, the pressure of this dirt against the plates forces them backward about their hinges, thus allowing the spring-arms to close, and the barbs or teeth will impale the animal and kill him. There is a projecting lug at the joint near the wire, and by bending this a little the adjustment of the hinge or plate can be made more or less delicate. This trap is very readily and quickly set, and is inexpensive, being made almost wholly of wire. It is made by the California Wire Works in this city.

Steam Colliers.

Most of the coal supply of this coast comes from the northern coast and abroad. California yields very little now that the Mount Diablo mines are such small producers. Oregon, Washington and British Columbia furnish us with large quantities. Of course an immense amount comes from Australia and England in the vessels which come here for wheat freights. Of late the supply from those sources has been lessened, owing to the fact that ship-charters here are unsatisfactory and there are now so many idle vessels in port. The northern coast coal, however, comes in abundance.

Formerly this coal was brought to San Francisco by sailing vessels. Old ships were used in the trade and made regular trips all the year round. A few years since five large steam colliers have been doing this work. The Oregon Improvement Company and the Pacific Improvement Company have both been running large steamers specially built for the purpose of carrying coal. It is now announced that they have not been profitable and have run behind in expense since they started. If rumor be true, the steamers will soon be taken out of this trade and sailing vessels be utilized instead, as it is said the latter can carry the cargoes for 50 per cent less than the steamers do. This looks like rather a backward step, especially when the shortness of the trip is considered.

Academy of Sciences.

At the regular meeting of the California Academy of Sciences last Monday evening, Vice-President Harkness presided. Among the interesting donations to the museum was a Gila monster from Arizona, donated by Oray Langdon. Capt. Churchill described the reptile and spoke of the conflict of opinion as to the poisonous nature of the bite. He had been bitten by it twice, and although the teeth were sharp enough to make a wound, there were no poisonous effects apparent.

Dr. Harkness called attention to an edible fungus (holitus) which is found in abundance at Berkeley and other neighboring localities. Specimens had been cooked and eaten, and found to be quite palatable.

Dr. Harkness also described, and illustrated by means of the microscope, a new fungus affecting the oaks. The early stages of this fungus is a white powdery mass, attacking and destroying the young shoots of the oak. The specimens shown were found by the doctor on Senator Stanford's grounds at Menlo Park.

A short note on the new star in Andromeda was read by the Secretary for Prof. Davidson,

MECHANICAL PROGRESS.

Safety-Valves.

It is surprising, says the *Boston Journal of Commerce*, to what an extent this important appliance is neglected in laying out, constructing and running boilers. When it is considered what its functions are in connection with the boiler, it would seem to be the point which should receive the first attention, after proper material had been selected and its proper construction specified, yet how often is it the case that elaborate specifications will be made out, calling for the best grade of steel, the highest class of workmanship, rivets of the best quality and to be put in just so longitudinal, seams to be double riveted and spaced in such a way, seams to be caulked so and so, gage cocks and water glass of the most expensive kind and of the nicest finish, connections for feed and blow to be reinforced, nozzles, dampers, lugs, front, etc., all specifically described and stipulated and modestly slipped in among the "fittings," a safety-valve of such and such a size. The builder, too often anxious to reduce his bid to the lowest notch, and not finding it specified that any particular kind or style of safety-valve is required, figures upon the cheapest arrangement which will pass under that name, and the owner gets a boiler with nickel plated and gilt edged trimmings, supposed to be of the best in every respect; but in this all-important respect of the safety-valve, it is fitted with a trap which is all the more dangerous, from its supposed superfine quality.

Do not have a boiler without a safety valve upon it; get a valve that is amply sufficient in area to clear your boiler when it is steaming its hardest; get one which is scientific in construction and honest in workmanship, so that it will not be found wanting, with the rest of the premises, when the crisis comes, and then have a cord conveniently arranged by which it can be tried at least once a day. A pop-valve will pay the increased cost in comfort, economy, and safety, but whatever description of a valve you get, pay at least as much attention to it as you do to the nickel plated trimmings upon your boiler front.

The editor of the *Locomotive*, of Hartford, Conn., writing upon the same subject, says: The safety-valve, as its name would seem to indicate, is one of the most important, if not the most important fitting that a boiler can be provided with, and it would seem that the most ordinary regard for life would be a sufficient incentive for any one who has charge, either of the construction or operation of boilers, to exercise every precaution that could be suggested or devised to keep it in good working order.

Yet this is not always the case. We frequently find, during the course of our periodic visits, the grossest violations of the simplest rules of mechanical construction and ordinary prudence, and this, too, by men of experience and recognized ability, and from whom we might expect better things.

A few of the many "outs" in the safety-valve may be mentioned here. One of the most common is the method of connecting up the escape-pipes to safety-valves, whereby they are carried into some flue; or, where there are several boilers in a battery, and consequently several safety-valves, connecting them all into the pipe, which leads sometimes into the chimney-flue, and sometimes out of doors. We should never advise connections to be made in this manner, for it will be found impossible to see when the valves leak; or, if they do leak, it is sometimes a matter of considerable difficulty to tell which ones leak, and which don't; now, under these circumstances, neglect is apt to be the rule, and the leakage goes on indefinitely.

The best way to run the escape-pipe from safety-valves is to run one from each valve independently. In most cases, these may be dispensed with altogether to great advantage, and steam allowed to blow directly into the boiler-room. If this plan is adopted, more care will be exercised by the attendant with regard to the uniformity of the steam pressure, and any leakage of valves will at once be noticed, and will be much more likely to be attended to.

We have known cases where escape-pipes from safety-valves have been run into flues passing over the tops of boilers, and the drip from leakage of the valve dropping down on top of the boiler-shell corroded the plate through in a short time, rendering a patch necessary.

The causes of leakage of safety-valves are, of course, various, but the principle is either bad design or poor construction, bad design being responsible, in the majority of cases, for too tight casings, which spring in connecting up the valves, or from unequal expansion of heat, etc. Too broad seats are a frequent source of annoyance, as it is impossible to keep them tight for any length of time, and such valves do not act with that sharpness and precision which is desirable.

GAS TIGHT RUBBER TUBES.—It is well known that illuminating gas will readily pass through ordinary rubber tubing. This often becomes a matter of great annoyance as well as loss. And now it is said that an Englishman has succeeded in making an elastic rubber tube perfectly gas tight and free from small. The tubing is made of two layers of rubber, with pure, soft tin foil vulcanized between. It is perfectly and permanently gas tight under any pressure,

and free from the slightest trace of small after long-continued use, while it retains the flexibility and elasticity of an ordinary rubber tube. The tube has been in use for some time, and has been thoroughly tested for months under continuous and heavy pressures. A rubber preparation of this kind would be of great service if used in the manufacture of the gas bags, which are of indispensable use in many gas engines.

The Use of Coal Cinder in Construction.

M. A. Louvier, an architect of Lyons, France, has sent a communication to the *Société Centrale des Architectes*, giving the result of some experiments upon the use of coal cinders in construction. The idea took its origin in the attempt by the contractors about Lyons to substitute this waste product of coal for beaten earth in their works. As they were not able to solidify it sufficiently by simply ramming, they mixed with it a little slacked lime. This was found to work very well, and arches were tried made of this material; the agglomeration took place rapidly, and this masonry, if it can so be called, presented enough cohesion to allow the uncentering of the arches within one month.

At the time the trial was made the cinder was so abundant about the various workshops of Lyons that the cost of the construction was only about one franc per cubic meter in place, but soon after, including transportation, plant and labor, it cost about five francs for the same volume. At the present time, after 13 years' trial, this method of construction has so expanded in places where economy is required that the cinder of Lyons is about exhausted, and the distance from which the material is brought has raised the price to the neighborhood of 11 francs per cubic meter.

In using this coal cinder in the foundation of workshops, warehouses, etc., the usual proportion is four parts of the cinder to one part of lime. At first an ordinary fat lime was used, but this has been replaced by hydraulic lime. But if a still greater resistance is required the proportion of lime is increased or hydraulic cement is used. In building up a wall the material is applied in beds about six inches in depth and well rammed. The walls are usually about 20 inches thick, but partition walls from 6 to 8 inches thick can be made either by ramming it between plank formers or by making it into the form of hollow bricks or flagging and then putting these together with plaster or cement. Arches in this material are made like those in beton, the only care required being to ram it tangentially and not perpendicular to the extrados of the arch; the latter action causes a tremor in the centering which has a bad effect upon the solidification of the material. The thickness of the arch will be in direct proportion to the weight to be carried.

This class of masonry, for a long time only used in structures of little importance, has within the last two or three years been adopted by the Lyons architects in works of greater pretensions, and M. Louvier has lately built with it almost the whole of the vaulting in the ground floor of the new municipal buildings at Lyons.

M. Louvier, previous to these heavy works, had made careful experiments upon which he has founded his calculations. It has been proved that fire has less injurious action upon this material than upon any other class of masonry.

German Shop Practice.

A German correspondent of the *Railroad Gazette* says: "Wood-working machinery in German shops is comparatively small in amount, owing to the great and yearly increasing use of iron in all parts. This is due to increasing cheapness of iron as compared with wood in proportion to its security. The use of wrought-iron instead of cast is very extended. I saw narrow-gauge stock building at Chemnitz and Leipsic with iron frames throughout, which had absolutely no cast iron in any part except the journal boxes. The increased use of iron is regretted by some master mechanics, on account of the great rigidity and of the consequently greater violence of shocks in train service. A surfacer, band-saw, cut-off saw, or driving planer and boring machine are the tools ordinarily found in German wood shops. Suctions for carrying shavings to the boiler-room are not used in the shops I have seen. The shavings are used, however, very extensively for firing, in combination with about nine times their weight in coal slack. This coal slack costs 84 cents per ton, delivered at the railroad. It is fired automatically with a hopper and a screw, which pushes the fuel in under the fire. It is also fired by being run from a hopper above the fire-door over a grate, inclined forward, from which it drops into the fire. The latter is raked partly back under the inclined grate, so that the fuel is well heated before joining the fire, and its smoke products pass over the front portion of the fire on their way to their flues, and are very effectually consumed. This firing method is common, I believe, to several styles of fire-box, but I do not remember to have heard before of its application to this kind of fuel, to which it is well adapted. By the use of this fuel and firing the boilers of the Chemnitz shops of the Saxon State Railway evaporate 100 pounds of water at an expense of 1.11 cents."

SCIENTIFIC PROGRESS.

Producing Electricity from the Oxidation of Coal.

The first step, it seems, has been taken in securing the heat efficiency of coal by direct process—that is, without employing any intervening substance, as water, which must be first converted into steam, at a great loss of heat, and then applied to a motor with another large percentage of loss—the two amounting to four-fifths of the entire heat efficiency of the coal consumed. Mr. J. A. Kendall, of North Ormsby, Middlesborough, England, exhibited at the recent International Inventions Exhibition an electric battery, which appears to be a decided step in the direction of producing electricity from the oxidation of coal without the intervention of a steam engine. The battery is based upon the well-known phenomenon of hydrogen passing through platinum at a red heat, two platinum plates being used as the poles, one exposed to hydrogen and the other to oxygen. These plates are arranged in the form of concentric tubes closed at one end, and are separated by a fluid medium of fused glass. Hydrogen gas is continuously supplied to the inner platinum tube, while the entire apparatus is maintained at a high temperature by means of a furnace fed with coke or liquid or gaseous fuel. The absorption of hydrogen by the platinum is accompanied by electric generation, and the current is led away by wires connected with the platinum tubes. It is curious, however, that, so long as the two platinum tubes are not connected by a metallic circuit, the passage of the hydrogen is slow, but that as soon as the electric circuit is completed, the rate of flow is suddenly increased and is steadily maintained at the higher amount. In the case of a group of cells or battery, the same gas furnace may be used to heat the series. The cells are connected for quantity and intensity as in the voltaic battery.

With the new generator, all that is required to maintain the working is a supply of fuel and a little water. The inventor estimates that a ton of coke used in heating the battery, including the hydrogen producer, will give at least three times the electrical energy that would be produced by the same quantity of coke used in working a steam-engine and dynamo. It is also hoped by the inventor to develop the new process of electric generation for lighting purposes. Houses can in this way be lighted by incandescent lamps by means of coal gas supplied to the premises; and larger centers of illumination could be economically worked by use of ordinary fuel, such as coal and coke. The invention promises to be one of much importance.

Who Invented Photography?

It has been generally taken for granted that the discovery of photography dates back only to the year 1839, when Daguerre, in France, and Talbot, in England, published the results of their investigations. It appears probable, however, that the art was discovered and practically applied by Matthew Boulton, partner of the celebrated James Watt, as long ago as the last century, and was then allowed to fall into neglect and to be forgotten. Boulton belonged to a secret scientific society, which was accustomed to meet at his house. He died in 1809, and on the subsequent examination and removal of the vast collection of documents stored in his library, there were found a number of crumpled and folded sheets of paper with pictures on them of the most puzzling kind. On smoothing out these pictures they were found to consist of copies, on large sheets of very coarse paper, of well-known designs by Kauffmann, the porous water-marked paper being thickly coated with some varnish-like substance, on the surface of which the picture had been produced. All the sheets found in the library, as well as others afterward discovered, presented the same characteristics—a glossy surface, with minute varnish-like cracks, the drawing of the figures most elaborately finished, the lights and shades so fully rendered as to give much of the effect of a mezzotint, and an invariable reversal of the position of the figures. Further research also led to the discovery of two silver metal plates, about the size of a sheet of note paper, precisely resembling in appearance those used by Daguerre in the early days of photography. On each of these plates was a faint image of Boulton's house, so unmistakably taken from nature and so evidently produced by the aid of light that experts at once pronounced them to be photographic pictures, taken directly by means of a camera. Attached to these plates was a memorandum stating that they were "sun pictures," representing the house prior to alterations made in 1791. All these facts led to the inevitable conclusion that the discoveries of Daguerre were anticipated by Boulton.

THE COMMERCIAL PRODUCTION OF HYDROGEN.—The old problem of the cheap production of hydrogen by decomposition of steam is being attempted afresh by M. M. Hembert and Henry. The process by these chemists consists essentially in passing steam, superheated to the point of dissociation, over incandescent coke. There is thus immediately produced a gaseous

mixture formed of equal volumes of hydrogen and carbonic oxide. This mixture passes into a second retort heated to a full red, into which is admitted a fresh quantity of steam at the same temperature as the former. This steam acts upon the carbonic oxide, and causes it to pass into the higher state of oxidation, that is, into carbonic acid. The volume of hydrogen produced by this second reaction goes to join that already formed; so that, when the operation is perfectly managed, 3200 cubic meters of hydrogen can be obtained from a ton of coke. The hydrogen is afterward purified with lime, to get rid of the carbonic acid; and there remains with it only a small proportion of carbonic oxide.

M. M. Hembert and Henry are now organizing a factory for the production of hydrogen by their method, and they hope to find a use for the gas for heating purposes.

Photo Emulsions Spoiled by Thunder.

The most noticeable effect of thunder upon gelatinous solutions or on emulsion is, says the *Photo. News*, to bring about a certain decomposition, which interferes more or less with the setting properties of the gelatine; and if the solution be kept, it quickly becomes putrid. In some extreme cases the emulsion refuses to set altogether; in others, where the injurious effect is less marked it does set, but tardily, and then, although the plates may turn out otherwise good, they generally fall or blister to such an extent, during the fixing and washing, as to render them next to worthless.

What is the actual effect, chemically, of thunder upon gelatinous solutions, at present is very doubtful. Whatever the effect may be, the cause is by some attributed to the presence of ozone, which usually accompanies violent electric disturbances in the atmosphere. But ozone will scarcely account for all the injurious changes wrought by thunder upon substances which are similarly affected to gelatine. For example, it is no unusual circumstance for ale which is stored in air-tight casks in underground cellars to be rendered both turbid and sour by a thunderstorm, and we have known an emulsion, while in a closed vessel, being spoiled from a similar cause. It is difficult to conceive, under these circumstances, how ozone can possibly be the cause.

Curiously enough antiseptics, which, under ordinary condition, prevent decomposition in gelatine, appear to have little or no influence in the case of thunder. It is worthy of note that thunder appears to exert little or no influence upon cold or jellied emulsions, neither has it upon concentrated solutions of gelatine, even when they are in a fluid condition. Therefore, as a piece of practical advice, we suggest that when electrical disturbances of the atmosphere are apprehended, precaution be taken that all emulsions be got into the jellied condition as quickly as possible. Also to bear in mind that it is during the emulsification, with the small proportion of gelatine, that the injury is most likely to arise.

It is a curious fact, but not the less true, that a severe storm may sometimes occur without causing the slightest inconvenience, while on another occasion, the conditions being apparently identical, a very slight one, even a single clap of thunder, will cause an immense amount of trouble. In all cases it is wise, when possible, to defer preparing emulsions, particularly on a large scale, when violent electrical disturbances of the atmosphere are anticipated.

ACTION OF THE SUN ON THE CAPITOL BUILDING.—Some time since U. S. Architect Clark suspended a plummet line from the interior of the dome of the capitol building at Washington, and it was found by actual measurement that the lead swung over a space of four and a quarter inches, making a total dip from the perpendicular of eight and a half inches. This movement involves the entire dome, and to some slight extent the entire structure, and is caused by the alternate contraction and expansion due to the action of the sun upon the material of which the building is composed. No doubt the principal part of the motion is due to the more ready expansion of the iron of which the dome is constructed; but similar experiments at Bunker Hill monument show that a structure built entirely of stone and mortar is also similarly affected by the sun's action. It has been very properly said, that by this motion the statue of the Goddess of Liberty upon the summit of the dome daily courtesies to the rising sun, and salutes him in a like manner as he sinks to rest, but without the formality of turning herself around.

MEASURING THE CANDLE POWER OF A LIGHT.—The candle power of a light may be approximately calculated by comparing the shadow cast by a rod in the light of a standard candle with the shadow cast by the light to be tested. By moving the latter toward or away from the rod a point will be reached at which the shadow cast by both lights will be of the same intensity. The intensities of the two lights are directly proportional of the squares of their distances from the shadows, i. e., suppose the light to be tested in three times the distance of the candles, its illuminating power is nine times as great.—*Electrical Engineer.*

SOLID BODIES shine in the dark, or become luminous, when heated from 600 degrees to 700 degrees F., and in daylight only when they reach a temperature of 1000 degrees,

ENGINEERING NOTES.

Cylindrical Nuts.

The substitution of cylindrical nuts for those of a square or hexagonal form has been advocated, with very good reasons as a backing. Recently an opportunity was given to see a practical illustration. A machinist had an order for a small ornamental steam engine, to be placed in the show window of a collar and spice establishment, and on it he used cylindrical nuts instead of hexagonal ones. This engine was a horizontal one, with steam chest on the top of the cylinder, and all the hold-down bolts were furnished with cylindrical nuts, through the tops of which protruded the flattened convex ends of the bolts, making a very neat finish. The bolts were three eighths of an inch diameter and the nuts three-quarters of an inch diameter; to have made them hexagonal they would have been a trifle over even-eighths of an inch from corner to corner, and if squares they would have been a full inch across corners, and neither the hexagonal nor the square nut would be any stronger than the cylindrical nut—the protruding corners give no additional strength. For a wrench he took a tool with opening jaws operated like a pair of pliers. These jaws, while slightly open, were reamed to fit the diameter of the nut, so that when closed on the nut the jaws would embrace almost its entire circumference; the leverage of the handles made a very slight pressure necessary to set up the nuts. The wrench did not have a short biting jaw, like a pair of pipe tongs, which dig into the pipe at each grip, but the inside of the jaws were perfectly smooth, and left no mark on the nut in using.

Another advantage that the cylindrical nut has over the angular nut is that the wrench may get a grip in moving through the smallest arc of a circle, an advantage that will be understood by the setter-up of the machinery under difficulties. With this square nut an entire quarter turn is required before, in a confined space, the wrench can get a new hold, and with the hexagonal nut not less than one sixth of a revolution is necessary before the wrench can take a fresh grip. When the wrench handle is long and the working place is limited, these considerations are of consequence. Cylindrical nuts can be made much quicker and for less cost than either the square or many-sided nut.

A TUNNEL THIRTY MILES LONG THROUGH SOLID ROCK.—The new Croton aqueduct tunnel now under construction from Croton to Harlem river will have a maximum capacity of 320,000,000 gallons per day, and will cost, when completed, \$15,000,000. The aqueduct will be a tunnel blasted through nearly thirty miles of solid rock, and lined throughout with cement and three layers of brick masonry. The contracts for this enormous undertaking were let on December 13, 1884, and the work is now under full headway, and to be completed within 33 months from the date of beginning. No less than 6000 men are toiling underground on this great work. On the whole line there are 26 shafts. The sub-contractors are under agreement to tunnel out the rock in their respective sections at so much a yard and to build the brick and stone waterway inside of it at set prices. At the bottom of each shaft the miners work in two directions, so that while one set of men is drilling southward there is a set of men in another shaft working northward to meet them. These shafts are about a mile apart, and yet so delicate and accurate are the plans of the engineers that in no case, they declare, will the line of the tunnel be more than an inch out of the way when the miners in the different tunnels meet each other underground.

RENDERING STEEL TOUGH.—Further tests of the new French treatment of steel for rendering it tough appear to confirm its value, imparting also to it a fineness of grain, an increased hardness, and a notable accession of strength to withstand rupture, this effect being most marked in the case of highly carbonated steel, and in this respect the metal is made to resemble tempered steel, without being in all points identical with it. The cause of this alteration in physical condition is attributed to the rapid heating and no less rapid cooling of the metal; that is, when the red-hot steel is first strongly compressed, which is the peculiar feature of this process, the conversion of the mechanical energy into heat serves to raise the temperature of the entire mass, at the same time that the particles of the metal are more closely cemented together. This effect is followed by a rapid cooling due to the contact of the plates of the hydraulic press with the surfaces of the metal, and the very close pressure very materially increases this conducting effect of the cold metal.

IRON CARS IN INDIA.—India seems to be taking the initiative in introducing iron cars. For several years the Government of India has been purchasing iron cars for freight business on Indian railways. Cars of this material are said to give entire satisfaction in service. Contracts were recently closed for the construction of 60 iron box cars and ten flat cars of the same material. All these cars are to be 25 feet long, and will be built in the American style, with center-bearing trucks and center coupling. The frame will be made of channel-iron steel, and the transoms of the trucks will be steel. The floor, sides and roof of the cars are made of sheet-iron riveted to angle irons.

USEFUL INFORMATION.

Danger from Hot Air and Hot Steam.

At a discussion on the spontaneous combustion of wood before the French Academy in 1879, M. Cosson described an accident which had occurred in his laboratory a few days before. While the narrator was working in his laboratory, a portion of the boarding of the floor spontaneously took fire. The boards were in the vicinity of an air hole, fed with warm air from a stove four metres (13.12 ft.) away on the floor below.

A similar accident had occurred two years ago, and in consequence M. Cosson had the boards adjoining the air-hole replaced by a slab of marble. The boards which now ignited adjoined the marble. The heat to which the boards were subjected was, however, very moderate, being only that of air at 77° F.; still the boards slowly carbonized and being thus rendered extremely porous, a rapid absorption of the oxygen of the atmosphere had resulted, and sufficient heat was thereupon produced to originate combustion. The danger thus disclosed, said M. Cosson, is one to which the attention of builders ought to be directed. In the instance in question, M. Cosson was able to extinguish the fire with a little water, as he was present and witnessed its beginning; but had it occurred at night, during his absence, it would undoubtedly have completed its work of destruction. M. Faye stated that at Passy, a few days before, a similar case of spontaneous fire, due to the action of the warmth from the air-hole of a stove upon the woodwork, had occurred at the house of one of his friends. The boards in these special cases may have been peculiarly subject to carbonization (it is not stated what they were). The case is of sufficient interest to push the examination still further.

The Journal of the Franklin Institute relates an experiment illustrating the effects of superheated steam in causing spontaneous combustion, which was once tried as follows: Steam was taken from an ordinary boiler through a pipe 40 feet long; 10 feet from the farther end a collar of wood was fitted closely to the pipe; 10 feet from the boiler a lighted kerosene lamp was placed under the pipe. In ten minutes the wooden collar was on fire. The Institute of Technology, at Boston, long ago decided upon the danger of steam pipes passing through and in contact with wood. It was shown that the wood, by being constantly heated, assumes the condition to a greater or less degree of fine charcoal, a condition highly favorable to spontaneous combustion. Steam was generated in an ordinary boiler, and was conveyed therefrom in pipes, which passed through a furnace, and thence into retorts for distilling petroleum. Here the pipes formed extensive coils, and then passed out, terminating at a valve outside the building. To prevent the steam when blowing off from disintegrating the mortar in an opposite wall, some boards were set up to receive the force of the discharge, and as often as the superheated steam was blown, the boards were set on fire.

MATCHES IN THE SHOP.—Matches are apt to be used carelessly in the shop, especially when they have to light up to finish out the day. Then smokers will be careless with matches even when they are not allowed to smoke in the shop. The boys will carry matches in the vest pocket. When so carried they are very apt to work out and fall into the shavings. A very good way, if matches must be used, is to buy the kind that will ignite only when rubbed upon the box which contains them. They are sold in little boxes having a sliding cover which extends entirely around the inner box. Get out a piece of wood which will slide into the cover one inch; then while in this position nail against the wall. It makes a neat little matchbox, and they may be put up at every gas burner. Every wood-working establishment is bound to burn up sooner or later. It seems to be their natural end, and they take to fire as naturally as a boy to a molasses hoghead. Some of them ought to burn; it is all they are fit for and that is all some owners keep them insured for. The other day a planing mill in Boston got on fire and burned up the watchman. It is generally customary for the watchman to wake up in time to give the alarm, but there seems to be an exception to every rule nowadays.

A SOLID FLOOR.—A friend of this writer once worked in a shop where they used to sweep the iron turnings under the floor. This sills and floor timbers were within six inches of the ground, and the dirt-boards through the floor soon got filled up. A new plank would be started up, and as the space beneath it got filled, still another one would be utilized. As time went on the space beneath the floor got all filled up solid. When the floor rotted out the iron filling was as hard as rock. New floor timbers were put in place of the old ones, but they had to be made smaller in order to get them into the holes. Cement was run in between the new timbers, the new floor laid, and no machine shop in the world has a better foundation. It was just simply "solid." The chips and turnings can't well be spared this year for such a purpose, for the greatest possible economy must be exercised in the present state of business depression. They must all go for the present to the cupola, because they will come out again as good as new and effect a material saving of stock.

Egotism in the Shop.

The opinionated man is likely to be a disturbing force wherever he may be placed, but nowhere is his more objectionable than in the factory or the shop. There he is a bar to progress, a foe to improvement, unless perchance the progress or improvement lies in the direction of his own inclination or belief. Every man is entitled to a wholesome respect for his own opinions, but it is stating a self-evident fact to say that no man should consider that he is master of all information on any one given subject. A machinist may be a most excellent workman, and yet there are those who can tell him many things about his work that he never thought of before. An inventor may be very ingenious and have a very fertile brain, but it is not unlikely that he could find men "within a stone's throw" who could offer him suggestions that would materially aid in perfecting his invention.

It is wonderful how little success will satisfy a man. As soon as certain mechanics are enabled to accomplish a portion of their work with reasonable skill, they at once conceive the erroneous idea that they have nothing more to learn, and assume by this very attitude that they are masters of their art. Upon observing such workmen we are forcibly impressed with the belief that "a little learning is a dangerous thing."

But if egotism is deleterious in the workman, how much more is it so in the manager of an establishment. If the workman is old foggy he need not necessarily impart his antiquated notions to his collaborators, but if the head of the establishment is such, the whole institution will be more or less influenced by his peculiarities.

The machine shop is a bad place for a man possessing an inordinate bump of self-esteem. He, like the hull in the china shop, is likely to do a great deal of harm. A machinist, above all others, should be a man of enterprise and of broad comprehension. He should be a many-sided man, with a keen observation and a power to grasp new ideas and make them valuable to himself. But when the machinist is a man of one idea, he is likely to stand in his own light and to bar the progress of others who depend upon his judgment.

TO RENDER SEA WATER DRINKABLE.—Thos. Kay, of Stokeport, England, has devised a process for making sea water drinkable. His process is to remove the chlorides by the use of citrate of silver. One ounce of citrate of silver will make half a pint of sea water drinkable. He proposes that bottles of citrate of silver be placed in the life boats of ships.

GOOD HEALTH.

Hope as a Remedial Measure.

It is perfectly useless for us to attempt to portray the influence that "hope" exerts upon mankind. It is a proverbial fact that a man without hope in the fight for life is already half whipped. The sick man without hope is desperately ill, indeed, however slight his physical ailment may be. It is equally as true that there is a very slight chance for the undertaker to be benefited in the case of a patient who has no disposition or idea of dying. The whole system, digestive, circulatory and nervous, is directly under the influence of the mind; and if we will ever bear this in mind in treating our cases, we will often have a more potent remedy, easy of administration and more pleasant to give and take than anything found in the country doctor's saddle bags or upon the shelves of our metropolitan pharmacists. Bad news, grief, or sudden disappointment has been known to reduce the circulation to a minimum, to cause a strong man to become as helpless as a child, and to arrest the process of digestion and assimilation as suddenly as if the patient's throat had been cut. Just the reverse of this may be observed under the influence of pleasant emotions and the life-giving power of bright, beaver-born hope. Never enter a sick room unless your countenance, manner and words are such to cheer and comfort the patient. However slight their hope may be, make use of that little, encourage and stimulate them to exercise that fortitude coupled with reasonable hope which has tided and will tide many a patient over dangerous shoals where medicine would have been utterly ineffective. With castor oil, turpentine and cheerful hearts, physicians can do a power of good and very little harm.

SOMETHING SMOKERS SHOULD HEED.—"I have been a physician," says an English contemporary, "stop a surgical operation and light a cigar, and I have seen the same cigar used in lighting other cigars. A brass finisher, on his way home from work, borrows your cigar. He returns it to you with a small quantity of brass dust adhering to it. This dust works itself into your mouth, which is a trifle sore already. The consequence is that your mouth is poisoned, and it may take months to repair the evil. A friend of mine cut his finger the other day. Before the cut had healed some sort of poison was deposited in it. The hand became stiff and swollen, and finally began to puff up as though it were inflated with air. He came to me, and after I had prescribed for him, we left my office together. I had just lighted a fresh cigar. In the street my friend asked me for a light. I handed him my cigar. When he returned it to

me I threw it away, and drawing a fresh cigar from my pocket, lighted it with a match. My friend looked at me in astonishment, and said he was sorry I considered it necessary to throw my cigar away. I told him I did that to show him that he had no more right to handle my cigar with his injured hand than a leper has to kiss a healthy baby. Of course he saw what it meant right off, and was always very careful after that. If I had acted as a great many men and women would consider it right to act, he would have gone around hauling cigars promiscuously, and perhaps have caused a great deal of trouble."

BURNING PASTILLES TO CLEAR THE ROOMS OF DISAGREEABLE ODORS.—The agreeable fashion of burning pastilles and fragrant herbs in rooms that are apt to grow "stuffy" in damp weather is almost a substitute for a fire on the hearth, which purifies and cheers the whole house. Ever since the mania for Japanese decoration came in there has been a demand for the delicious pastilles or "reeds," which are the condensation of Eastern fragrance, and their use brought about a greater love for aromatic odors of a refined and purifying nature. The subtle sweetness, permeating articles that come from China or Japan will last for years, and affect the atmosphere, not only of the room they are in, but of the entire house. There is not a Rimmel nor a Lubin in Europe that can produce this intoxicating, and, if one may say, high-bred perfume from the Orient, try as he may. A bunch of Japanese pastilles, mouldering one at a time in a little incense burner, will last several weeks, while for olfactories disliking any perfume, however delicate, a bit of gum camphor or little stack of pine needles produces a most refreshing odor while burning. Pine needles can be gathered by the bushel and kept all winter, to be thrown on coal fires in city houses.

GROWTH OF THE HEART.—Dr. Boeckx, of Marburg, communicates his observations on the growth of the human heart, the fact appearing that the increase is greatest and most rapid during the first and second years of life, its bulk at the end of the second year being exactly double what it originally was. Between the second and seventh years it is again almost doubled. A slower rate of growth now sets in, until about the fifteenth year, the augmentation of volume during this intervening seven or eight years being only about two-thirds. In the period of maturity which now approaches the growth of the heart again makes progress, the increase keeping pace with the advance toward maturity of the other portions of the system. After the twentieth year up to the fiftieth, the annual growth is about .061 of a cubic inch, the increase ceasing with the fiftieth year, a slight diminution then ensuing. In childhood the male and female heart are alike; after maturity the male heart develops more than that of the female, and the difference of one and a half to two cubic inches thus established is said to be maintained throughout the remainder of life.

TAKE CARE OF THE SKIN.—Many people are invalids, and large numbers will become invalids, for the want of paying the most ordinary attention to the requirements of the skin. This membrane is too often regarded as a covering only, instead of a complicated piece of machinery, scarcely second in texture and sensitiveness to the ear and the eye. Many treat the skin with as little reference to its proper functions as if it were nothing better than a bag for their bones. But this inconsideration for the skin is the cause of a very large proportion of the diseases in this world. When we remember that, even in a state of rest, an insensible perspiration carries from the body almost double as large an amount of fluid as is done by the lungs, and which is, of course, turned back upon the system as a poison, when the delicate little openings of the skin are stopped, we can begin to understand that health must depend, to a large extent, upon this exhalation through the skin, and it proves to us the vital importance of frequent and thorough ablutions of the whole body.

POISONED BY A WOOL SAMPLE.—A remarkable case of poisoning occurred at Nuttschein, Germany, in January last. Mr. Perl, a carpet manufacturer, was taken ill from a swelling of the upper lip, which he attributed to a cold. The next day symptoms made their appearance, which were recognized as symptoms of a splenic disease by his physician. This disease is very contagious, and is frequently found with animals, especially sheep. Mr. Perl said he had received a wool sample, on which he smelled several times, after which he felt a burning sensation under the nose. There was no doubt the wool came from a diseased sheep, and that the poison was taken up through the skin being affected with a cold. Mr. Perl died two days afterward in great pain.

THE ODOR OF DARK AND FAIR PEOPLE.—The cutaneous exhalation of Alexander the Great, according to Plutarch, had an odor of violets. A smell of prussic acid is said to be given off by dark-complexioned individuals, while blondes are said to smell slightly of muck.

BLOOD CIRCULATION.—A medical authority gives the time taken by the blood of a dog in making the entire circuit of the body as 17½ seconds, during which the heart makes 51½ pulsations.

MINING SUMMARY.

The following is mostly condensed from journals published in the interior, in proximity to the mines mentioned.

CALIFORNIA.

Amador.

QUARTZ.—Amador *Sentinel*, Sept. 30: Capt. Glenn & Co. are said to have a very good quartz prospect in the Rancheria region. The Gillick mine, Volcano, is said to be a fine development. The ledge is of considerable extent and the ore of exceeding richness. Work at the Tellurium mine, near Pine Grove, is progressing as rapidly as it can be done. The hoisting machinery has been repaired and put in good running order. There is talk of starting up the Downs mine, of Volcano, again. A good many thousand dollars have in the past been taken from this mine, and it does seem as though there should be more gold there yet. The tunnel of the Mammoth mine is being pushed ahead at the rate of five feet a day and is now in 2500 feet. It is now in several hundred feet beyond the point immediately under the shaft, which fact would indicate the determination to tap by its means other mines nearer Jackson, possibly coming as far as the Moore. No attempt has yet been made to drift for the Mammoth ledge, but we understand that that work will shortly be commenced. Crushing at the Amador Queen mine has been going on with more or less regularity as the supply of water would permit. Mr. Shugert expresses himself perfectly satisfied with the result of the crushing, though is restless under the fact that he cannot get enough water to crush steadily. All available space is filled with ore, and the ledge being 30 feet wide it could be taken out with rapidity if it could only be crushed. This winter when the water supply becomes steady lively times may be expected at this mine, and its success will stimulate the development of others in the same vicinity. Mr. Skinner, a mining expert from San Francisco, has recently been prospecting around Volcano, and expresses himself as very favorably impressed with that region. He says with considerable show of confidence that good mines can be developed there, and if capital could be induced to take hold results would be obtained of sufficient value and extent to insure the permanent prosperity of the town.

THE KENNEDY MINE.—*Dispatch*, Sept. 3: It now begins to look as though the old Kennedy mine, which has been lying idle the greater part of the time for several years past, is to be started up again and worked on a large scale. On last Monday night Mr. Francis Reichling came up, in company with two other San Francisco capitalists named Belshaw and Varnum, for the purpose of making the necessary arrangements for resuming operations as soon as possible. The new company, we understand, will spend about \$35,000 in sinking, running crosscuts and getting the mine in good working order, after which they will put up a new 40-stamp mill, with all the modern improved machinery for saving gold—something like the works at the Zeile mine. When this is done there is scarcely any doubt but that the Kennedy will take its place as one of the best paying mines in the county.

El Dorado.

GRIZZLY FLAT.—*Placerville Observer*, Oct. 7: We visited this old camp recently, and found it duller than we have seen it for some years, notwithstanding the Mt. Pleasant, which has long been the mainstay of the town, was running with full force, as usual, with about 40 men on the pay-roll. Captain Smith, the superintendent, informed us that the mine did not make expenses the past two months, (though the men received their pay just the same) but the indications were favorable for a fair surplus the current month. The plant of this mine is most substantially constructed and embraces all the most approved machinery for economically and effectively working the ores and saving the bullion product. But little work was being done at the Melton mine in consequence of scarcity of water. There is some little prospecting being done in the vicinity, but we could learn of no particularly flattering results, though it was rumored that some flattering prospects had been obtained at Dogtown.

Inyo.

MAXIM MILL.—*Inyo Register*, Oct. 1: John Alexander ran this mill last week on a lot of gold ores from the Poleta, using plates and concentrators, and on a test lot of copper-silver ore from the Brockman mine to see how well it would concentrate. In both cases, the concentration was down to about one-fourth. The clean-up of the Poleta ore was satisfactory, it being selected ore, but the point of greatest moment was not to find out what the first-grade ore would pay, but whether, through concentrating, the mass of the ores in the mine will pay to handle. The value of this lot (both lots in fact) is yet to be determined, and if found satisfactory, a separate test of the inferior grades of the ores will be similarly made. The great issue hinges upon the latter; if through concentrating a margin for profit is shown on the general average of ores from either of these two dissimilar mines, mining here will receive a most wonderful impulse. The system has brought success elsewhere, and we are confident it will do the same here. The appearance of the copper concentrates indicates success almost to a certainty, though, as before stated, a more extended trial upon the inferior grades of the ore must be made before the matter is finally determined.

PANAMINT.—*Independent*, Oct. 2: Mr. N. G. Fairman has a gang of 17 men employed on a road between the town Panamint and the mouth of Panamint canyon, under his personal supervision. Two-thirds of the distance is now covered and it is expected that the work will be completed in about three weeks. It is Mr. Fairman's intention to put the force at work in the mine as soon as the road is completed, and also to build a mill as soon as practicable. A number of miners are at present chloriding in this district. Mr. J. C. Eddy is preparing to make a run at Snow's canyon. From the character of the ore it is expected to be very successful. Messrs. Gorman & McKenzie have just completed a short run and turned out some high-grade bullion.

Mono.

BODIE CON.—*Bodie Free Press*, Oct. 5: The east crosscut 700 (Lent shaft) level is now in 61 feet; the north drift same level, is in 58 feet; the joint east

crosscut, same level, is in 18 feet. The joint upraise, 400 Mono level, is up 56 feet; north drift 400 Mono level, is in 55 feet; 37 men employed.

MONO.—The south drift 700 (Lent shaft) level is in 46 feet; east crosscut 200 level is in 22 feet. The joint upraise 400 level is up 56 feet. South drift from No. 1 winze 550 (Lent shaft) level, is in 64 feet. They find rich ore in this drift; 13 men employed.

CON. PACIFIC.—Winze No. 2 has been sunk to a depth of 10 feet; ground working fairly and vein looking as well as when first cut.

Mariposa.

THE HOPE OF MARIPOSA.—*Mariposa Gazette*, Oct. 3: On the 27th ult. the new mill of the Francis mine (rechristened the "Hope of Mariposa") was started up with appropriate ceremonies. The mill is a 10-stamp one, and is run by an engine 14" dia. and 36" stroke supplied by steam from a boiler made at the Risdon Iron Works. The stamps were run at 80 drops per minute. There are two tunnels run in on the Francis ledge, and an incline is sunk 30 feet deep on the Morrell ledge. The ore in sight is abundant and looks well. In the mine the tunnel is now ready for stoping and extracting the ore, which work will be speedily pushed by the force under Mr. Mitchell, from this time forward. The company have another mine bonded from Surveyor Gould and Jimmie Craighead, called the Moore Hill mine, located on the creek about a mile below the present works. The vein carries a honey comb quartz with free gold, and is looked forward to as being a good property.

Nevada.

DEVELOPMENTS AT THE BANNER.—*Herald*, Oct. 3: Last week a ledge varying in thickness from six to eight inches was unearthed at the old drain tunnel of the Banner mine, southeast of town about three miles. It is supposed to be the old Gillean ledge. Samples of ore shown us were good specimens of rock. Some of the pieces were filled on one side with sulphurets, which to the uninitiated looks fine, while on the reverse side large quantities of ochre are present. Some porphyry was taken from the ledge, which also contains much ochre. The development is considered good by judges who are competent to give an opinion. The company have been working a long time, and anything of this sort is hailed with much gratification. Some of the members reside in this city, Mr. Earl and Ed. Brown. The mine is known by the name of Banner, and is an extension of the old Banner, famous in former years, and out of which a mint of money was taken.

WASHINGTON DISTRICT.—*Nevada Transcript*, Oct. 1: The Spanish mine, three miles north from Washington, continues to pan out splendidly. Two Huntington mills are crushing about 75 tons of ore per day. This mine is a very peculiar formation, being apparently quartz and chrome iron decomposed and forming a substance something like pulverized bricks, in all shades, from light yellow to dark brown. It runs in parallel streaks, from an inch to six or eight feet thick, with streaks of slate of about like thickness intervening. The entire thickness of the lead is about 100 feet. All the intervening slate contains considerable gold, but as yet none of it has been milled. The company owns 4500 feet in length of the lode, and will soon put in two or three more Huntington mills. Sam. Baxter and J. D. Harroun have the first locations south of the Spanish company. Many other locations have been made in all directions from the Spanish, and some of them get good prospects. "Coon" Grissell and E. T. Worthley in working their river claim just above town, cut through a fine looking quartz vein about three feet thick. Henry Kohler, Charles Helgeson and others have some rich looking ore in their mines on Canyon creek. The Baker mine, on the south side of Yuba, opposite the mouth of Canyon creek, is yielding good ore, and to all appearances there is plenty of it. The ore is crushed at the Ocean Star mill. Between the Ocean Star and Helgesonville, less than three miles up the river, hundreds of locations have been made on both sides of the river, but no work is being done on any of them yet. The Blue Jay mine, belonging to Messrs. Peck, Campbell, Chadwick and Baugh, of Blue Tent, and Frank Young, of Nevada City, is turning out some exceedingly fine ore as they drive their tunnel. The lead in the face of the tunnel now is from 20 to 30 inches thick, with free gold showing throughout. The Cornucopia, the first mine ever located in the district, belongs to an English company. It has lately erected new hoisting and pumping machinery heavy enough to work the mine 1000 feet deep. The incline on the lode is being sunk night and day, and is now down about 100 feet with a good-looking, fair-sized lead in the bottom. The Yuba mine, the second location in the district, is one of the best mines in the county. For nearly 20 years it has been worked by various parties who contented themselves with running into the mountain side. A few years since the property was purchased by Messrs. J. B. Haggins and J. N. Webber, of San Francisco. At first they tried the tunnels in the mountains with the usual results, but finally concluded to sink below the bed of the river. At once the mine assumed a new aspect. The lead was found thicker, richer and more regular the deeper they went, and the ground became softer and more easily worked. The shaft is now more than three hundred feet below the river bed. They have added 10 new stamps to their mill this summer, making 25 in all, and contemplate erecting 25 more stamps next spring. They have an unlimited free water power. The mill is run by an overshot wheel, and the hoisting, pumping and compressor machinery is run by Pelton wheels. On the north side of the river, a little further east, is the Governor Morton G. M. Co.'s (or Champion) mine. This company has lately erected a Huntington mill and has extracted some exceedingly rich ore. There are three or four good sized lodes running parallel. East of the Champion is the Blue Bell, belonging to J. G. Fredenburr. This is a strong, well defined lead, from three to 6 feet thick, traceable for a long distance. Within the exterior boundaries there is another larger lode running parallel about 100 feet east of the Blue Bell. The Eagle Bird mine is situated on the south side of the Yuba river, and nearly south from the Governor Morton and the Blue Bell, both of which apparently run right into the Eagle Bird. The shaft on the Eagle Bird is now down over 300 feet, in as good or better ore than ever. In sinking the lead was found to be from two to ten feet thick, but the thin places were the exception, so that the average was about eight feet. The various levels averaged even more, some of them showing a lead of more than 20 feet thick. Every pound of

rock taken out is crushed at a profit. The 20 stamps and two Huntington mills are kept running night and day, crushing about 60 tons each 24 hours. Mills, hoisting works, pumps and compressors are all run by water, of which the company owns an unlimited supply. Several Pelton wheels are used. The company has lately purchased and is now putting in place a large new compressor with power to run six air drills. The one now in use being only sufficient for two drills, will be discarded. On the same side of the river, a few hundred feet east of the Eagle Bird, is the Waters mine, on which there is a Huntington mill and ample buildings; but from some unknown reason operations thereon have been suspended. Further east, up the canyon of the Yuba on either side, many more locations have been made within the last year, but from the inaccessible character of the country there has as yet been no attempt at development.

CENTRAL QUARTZ MINE.—*Grass Valley Union*: Energetic work is being done on the Central mine, on Greenhorn creek. It has been but a few weeks since the lessees commenced work, but in that time they have raised an air shaft from the tunnel 80 feet, and driven the tunnel ahead quite a distance, finding a large ledge, which has increased to 10 feet, 10 feet of which is taken out as they go. The quartz is of fair milling quality, estimated to yield from \$12 to \$14 per ton. The tunnel is to be driven ahead to a point where the backs will be about 175 feet, as shown by survey, where the vein is strong and good as demonstrated years ago by the old company, before the whole of the ground was owned by the present company. The work now being done is by two regular shifts of miners, and when the objective point is reached, as stated above, regular stoping will be commenced. The company design erecting a mill at an early day, and by the time the stamps are ready to drop there will be a large amount of quartz ready on the dump. Everything about the mine is working to excellent satisfaction, and the prospects for the future are regarded as encouraging.

Siskiyou.

KLAMATH.—*Yreka Union*, Sept. 3: Woods & Co., on Klamath river, struck bedrock last Monday and are greatly encouraged at the prospects obtained. In reaching bedrock they worked a streak of gravel which paid \$3 a day to the hand. The owners of the Kittlewood claim, on Klamath river below the mouth of Scott river, cleaned up 218 ounces last week, the result of one week's work. The company had almost decided to suspend operations for the season when pay was struck.

Plumas.

THE WEST ELIZABETH.—*Plumas National*, Oct. 3: This mine is situated about two miles northwest of the famous Plumas Eureka, and is showing a well-defined ledge that prospects well, and under the able management of Mr. Hiram Pilsen, promises to develop into a good paying property.

Sierra.

CLEAN UP.—*Sierra Tribune*, Oct. 2: A cleanup was made at the Young America mine this week, after a nineteen days' run. Manager Busch, accompanied by Superintendent Saunderson and Messrs. Casserly and Deidesheimer, Jr., brought down the bullion yesterday, which consisted of two very handsome gold bars, and another lot milled in the shape of a wedge.

A NEW ENTERPRISE.—Some twenty-five years ago a party of Mexicans discovered a quartz ledge at the head of Avalanche ravine, built an arastra thereon and worked on the vein to a depth of about twenty-five feet, and then abandoned it. Since that time the claim has remained unmolested, until last month, when Mr. Lawrence put a location upon it. He also organized a company to join him for the purpose of developing the mine. The company is comprised of twelve, among which are the following names: John Rose, Watt Hughes, D. Mitchell, R. Castagna, Joe Giurovich and others. The claim has been properly surveyed and the lines brushed out. Three men are up there working, and they have already run a tunnel in twenty feet. This tunnel, it is calculated, will reach the vein in about 120 feet, at which point it will give 200 feet of backs. The claim is located two miles east of the Keystone mine, in the Keystone district. Very fine prospects can be obtained from the rock.

FLORENCE CONSOLIDATED.—I. T. Mooney and S. R. Stephenson returned from San Francisco last week, and a day or two later were followed by a couple of gentlemen named Shepherd and Green, who came up to look into the merits of the Florence mining property. Last Sunday these parties went up to the mine, and we are pleased to state that as a result of their investigations, all the arrangements have been concluded for beginning the work of developing this really promising property at once. It is the intention to start a tunnel on the newly discovered vein at a point which will ultimately give some three hundred feet working depth. The work on the tunnel will be pushed ahead night and day this winter, and as soon as it is possible to proceed with the work next spring, a 10-stamp mill will be erected at the mine.

AMERICAN HILL.—*Mt. Messenger*, Oct. 3: Supt. Burman was down this week from American Hill, and reports the tunnel of his company in Bunker Hill 269 feet, with face of hard blasting rock. When in 300 feet it is his intention to raise for gravel, which is expected to be about 22 feet above the tunnel, and to pay at least \$6 to the carload.

FOREST CITY NOTES.—Bald Mt. Extension Co., Forest city, cleaned up for last week's work 153½ ounces. The streak of cemented gravel encountered in the Extension two weeks ago was very limited in quantity, passing away in a few days. The channel is at present 170 feet wide, all free gravel, and pays well clear across, and is still growing wider. All channels contain more or less cemented gravel in spots. The Extension company has purchased from the South Fork Co. the bed of the South Fork of Oregon creek, to be used as a tailing claim. Supt. Lawry spent several days at Columbia Hill last week making arrangements to forward the new pump for the Pliocene. B. F. Littlejohn and partner are still driving ahead on their lower tunnel to tap the old arastra ledge, located at Middle Waters. The Bald Mountain Co. expect soon to put on their full force of men.

Tuolumne.

BUCHANAN MINE.—*Cor. Union Democrat*, Oct. 3: The Buchanan is the coming mine of Tuolumne county, and ere long, when the stamps begin to

drop, the bullion shipments will furnish plenty of practical proof of the fact. About sixty white men are now employed in the mine and on the various works connected with it, besides quite a large force of Chinamen. All the lumber needed for the present having been sawed out, the sawmill has ceased operations. The flume will be finished in about two more weeks. It will be 5¼ miles in length when completed. Boarding house, blacksmith shop, office and other outbuildings have been erected, so that around the mine begins to look like a village. The ore tramway has been completed, and the only important thing yet to be put up is the mill. Work commenced on that last week and is now being pushed ahead. The boiler has already been put up. Steam power will be used to drive the machinery, as it is not possible to obtain water power. In the mine work is confined to drifting on the 600 foot level and sinking the shaft, and from what I can hear the mine is looking better every day.

ALBANY.—*Cor. Tuolumne Independent*, Sept. 3: The new Albany mine has resumed work. At present there are a few men engaged in bailing the water out of the main shaft. As soon as it is low enough to permit, active operations will commence in the mine. John Summers & Co. have recently performed assessment work on the Mammoth Sulphurets claim. The boys report a large vein of good looking rock.

STRIKE.—Hearing that Mr. R. O'Donnell, of Jamestown, had made a very rich strike, I took occasion one day of last week to visit his mine, situated in the old Sayre ranch, close to the Campo Seco road. The shaft in which he is working is about 55 feet in depth, where is found a 20-inch vein, in which gold may be plainly seen with the naked eye. The mine is worked by Mr. O'Donnell and his son, who thus far have, though working at a disadvantage, taken out about 65 tons of rock, worth (a few tons having been crushed) from \$15 to \$20 per ton.

NEVADA.

Washoe District.

HALE & NORCROSS.—*Enterprise*, Oct. 3: Work was not resumed on the lower levels quite so soon as anticipated the first of this week, and increased difficulties were found to contend with in the drift south from the deep winze on the 300 level of the Hale & Norcross, on account of the drift being run on a slight down grade for drainage purposes when the connection shall be completed with the drift coming to meet it from the Combination west drift. The debris from the south drift of the Norcross has all to be taken north to the winze and up through it to the 3000 level and thence to the Combination shaft. There remains less than 30 feet to be cut through in order to make the connection between the two sections of the drift. The main crossdrift west from the bottom of the deep winze is still in fine streaks and bunches of ore, showing signs of concentrating into a good ore body before long. Meanwhile the north lateral drift on the 3000 level is being again actively pushed ahead. It is in vein porphyry and quartz, and its face is only 160 feet from the Savage south line. The bonanza outlook in that direction has always been considered good, and when the 300 level connection is completed and the big hydraulic pump is in full working trim, ready to handle all the water that may come along, the main lateral drift north on that level will eventually be continued to the Savage.

CHOLLAR.—The north lateral drift run through into Norcross ground, to meet the drift coming south from the deep winze, is advancing along the east bordering of the ore vein, and will make connection with the other section of the drift tomorrow or next day, if not sooner. After this connection is made, and a good air circulation established, the main drift west from the Combination shaft will be driven ahead in Chollar ground, 60 feet north of the Norcross line, and be pushed through to the west wall of the lode. A lateral drift south may also be started at some eligible point for Chollar explorations.

CON. CALIFORNIA AND VIRGINIA.—The Morgan mill on Carson river, being run by steam, is being kept steadily supplied as usual with ore from the 1750 level, about 110 tons per day being extracted on company account. This ore gave average assays last week of about \$25 per ton. The surface machinery at the old Consolidated Virginia shaft is now all in complete order, and the shaft is being repaired from the 1550 level up to the 1200. Quite a number of men are also employed in opening out more ore breasts and giving better facilities for extraction when it shall be deemed advisable to resume ore and bullion production.

KENTUCK.—The regular daily yield from the old upper workings still continues, keeping the Rock Point mill, on the Carson river, steadily running. This is one of the most quietly and continuously worked mines on the Comstock. The milling never stops, and the mine never fails to keep the mill supplied.

SIERRA NEVADA.—During the past week the crosscut west on the 520 level, 1000 feet north of the shaft, has been extended 38 feet, making a total distance of 369 feet, leaving a little over 100 feet yet to go in order to reach the west wall. The face is principally in hard vein porphyry, with a slight seepage of water coming in at present.

CROWN POINT.—The repairs to the surface works are completed. A few men are employed in the mine opening up ore breasts and preparing for active ore extraction as soon as a proper increase in the Carson river shall furnish the requisite motive power for the mills. Little or nothing doing in Belcher.

OPHIR.—The drift west from the old Mexican shaft, on the 400 level, is now in over 100 feet, and appears to be getting into the old Ophir ore vein, where large quantities of fair-grade quartz were left in the early days, which it is thought can be made to pay well now for extraction and milling.

GOULD & CURRY.—Owing to other work having to be attended to, only 10 feet was added to the length of the crosscut west on the 1000 level, near the Savage line, making a total length of 422 feet. Material still in dry vein porphyry, with a little quartz and clay.

BEST & BELCHER.—West crosscut No. 2 on the 1000 level has been extended 30 feet during the week, making a total length of 442 feet. A little more quartz appears to be coming in at the face.

ALTA.—Good progress continues to be made run-

ning the crossdrift west on the 700 level. Rock hard blasting. About 250 feet further to go in order to reach the vein.

MONTICRISTO.—The new shaft is down 150 feet, with its bottom in hard, dry blasting rock. Judging from the dip of the vein, as shown in the workings hitherto, this shaft will have to be sunk about 50 feet further before intersecting it.

YELLOW JACKET.—The Brunswick mill pursues the even tenor of its way working steadily on ore from this mine, which is extracted at the rate of between 160 and 170 tons per day, from the old workings on and above the 1300 level.

UNION CONSOLIDATED.—The total length of the main lateral drift north on the 500 level is now about 700 feet. The material in the face is porphyry with streaks of quartz and clay.

MEXICAN.—The middle crosscut east on the 500 level is now in about 300 feet. Material, vein porphyry with streaks of clay and quartz, and a little water.

ANDES.—The drift west on the 175 and 375 levels are making good progress in favorable vein matter, some of the quartz met with in the lower level giving low assays.

Bernice District.

MILL REPAIRED.—*Silver State*, Aug. 21: A note from Lovelock to the *Silver State* says the Bernice mill has been thoroughly overhauled and repaired, and will be started up this week by G. W. Bothwell. W. W. Williams is making arrangements to build a new mill on the east side of Bernice Canyon.

EAGLE BIRD QUARTZ MINE.—*Grass Valley Union*, Sept. 3: The Eagle Bird quartz mine in the Washington District is situated on the south side of the Yuba river. The shaft on the mine is now over 300 feet in as good or better ore than ever. In sinking the lode was found to be from two to ten feet thick, but the thin places were the exception, so that the average was about eight feet. The various levels average even more, some of them showing a lode of more than 20 feet thick. Every pound of rock taken out is crushed at a profit. There has never been 20 tons of waste rock taken from the mine. The 20 stamps and 2 Huntington mills are kept running night and day, crushing about 60 tons each 24 hours. Mills, hoisting works, pumps and compressors are all run by water, of which the company owns an unlimited supply. Several Pelton wheels are used. The company has lately purchased and is now putting in place a large new compressor with power to run six air drills. The one now in use being only sufficient for two drills, will be discarded.

Dun Glen District.

THE AUBURN MINE.—*Silver State*, Sept. 1: Two gentlemen named Brown and Underhill, stockholders in the Auburn mine near Dun Glen, arrived here Monday and went to the mine, from which they returned yesterday and left for the East. One of them intends to return again shortly, with a view of resuming operations on the mine. The company have a 20-stamp mill, from which a tramway runs to the mine. Work was suspended on the property over two years ago in consequence of the scarcity of water at the mill, and has not been resumed since. The ore was worked exclusively for gold, and it is said that if properly managed it would pay, as it assayed from \$10 to \$22 per ton, and there are large quantities of it.

Eureka District.

ADAMS HILL.—*Eureka Sentinel*, Oct. 2: A reporter of the *Sentinel* visited Adams Hill yesterday afternoon and found some 40 miners there busy as bees. In the Morning Star mine were five men working, among them being Messrs. Faulkner and Fulton. They were hoisting waste rock at the time, but on the dump were several tons of ore ready for shipment, and they expect to again resume the extracting of ore to-day or to-morrow. In the Frazier and Molino a couple of miners, formerly of Ruby Hill, and Frank Rogers, the crack shot of the State, were hard at work. These miners made a shipment of ore last week that worked over \$700 a ton. In the Silver Lick three gangs of men were found hard at work, among them Tom Rosevear, Tommy Jacks and Giles Weller. All these miners, especially the former, have for a long time past done and are still doing very well. Alec Frazier and Joe Molino are working in the Wide West with good results. In the Marguerita Messrs. Haynes, Hall and Morrison are working and doing well. Frank E. Wittenberg and Wm. Spencer were found in the King Lear, with some good ore on the dump and more in the mine ready to be extracted. All the miners of the Hill ship now and then a number of tons of good ore, but little of which assays less than \$100 a ton. In value it works from one-half to two-thirds gold. The feeling among all employed there is good. While they are tributaries and leasers and take chances on making something, they say they prefer it to working for \$3 a day.

Lake District.

GOLD DEVELOPMENTS.—*Hawthorne Bulletin*, Oct. 1: Last Wednesday the sale of Bradley's interest in the Lapanta was completed, and Archie Farrington and Yerington & Bliss took possession. Bradley received \$35,000 for his two-thirds, and immediately made preparations to open another mine which promises even better than the one just sold. Within a few days Fox and Henry have discovered some rock which astonishes those who have been accustomed to panning out Lapanta rock, and it is the general impression that they are in the real center of the gold deposit. The district is a vast pile of limestone, containing a network of ledges of decomposed quartz, and there seems to be no boundary to the gold area. In all directions, and in the most unpromising places, prospectors are finding deposits of the precious metal, and all orthodox rules of search have been abandoned. The theory which is now popular is that the gold is where it is found, and how and why it came there is left for future consideration. A toll road has already been projected, two townships are beginning to show their pin feathers, and a stage line will soon be in operation. Lake District has many prospectors and there is room for many more, but it is not a land flowing with milk and honey. Those who expect to find gold must be prepared for a rough, difficult country. Nature does not hide her treasure in flower gardens, and those who come are warned that they will have to take everything they require with them. Water and wood must be hauled from Hawthorne. The district is an absolute desert and

the hardy men who live there earn the gold they find. Already town lots have been sold on Water street and Fountain avenue, in Lake City, and the real estate fever has taken a good start. Lake District is the center of attraction, but were it not for the wonderful discoveries there many an eye would be directed to the eastern slope of Mount Grant, where Gardener and his partners are finding quartz containing enough gold to create an excitement at any other time. There are immense quartz ledges on the mountain and they have discovered the place where the gold lies. As there are wood and water in abundance on the ground a mill or system of arrastras will probably soon be erected.

Tuscarora District.

BELLE ISLE.—*Times-Review*, Oct. 2: Crosscut west 350-foot level advanced 19 feet, total length 236 feet.

NORTH BELLE ISLE.—Drift north 150-foot level, advanced 18 feet. No material change. No. 1 winze, 70-foot level has gained a total depth of 53 feet. The vein is small and ore low grade.

NAVAJO.—Crosscuts were extended east and west from the south drift on the 650-foot level 104 feet. There is no change worthy of note. Good progress has been made with the work at all other points.

GRAND PRIZE.—South drift on the 400-foot level has been extended 14 feet, and upraise above the 400 has been extended 14 feet. East crosscut on the 300 is in 170 feet. It has reached the foot wall—and not finding any ore there, work has been discontinued. North drift on the 200 level, east vein, has been extended 22 feet, and the south drift 20 feet. Will get through milling about the 4th inst.

ARIZONA.

STOCKTON HILL.—*Mohave county Miner*, Sept. 28: Stockton Hill has long been known as the richest mining camp in the county, and for the size of its ledges and the general average of its ores, it is probably one of the richest in the world. The ores of this camp on the hill run from \$50 to \$250 per ton, and in some instances run beyond the latter figure. If all the ore ever taken from the mines of this camp was thrown together and sampled the general average would be in the neighborhood of \$200 per ton, for every ton ever brought to the surface. The Cupel claim contains in its boundaries six parallel veins, all of which contain rich ore, and all of which will be worked in a few weeks. This property is the oldest and best known on the hill, and is owned at the present time by the wholesale liquor firm of Spruance, Stanley & Co., of San Francisco. About a year and a half ago this firm spent some \$20,000 in an attempt to develop the mine, but the management was placed in incompetent hands with the usual result, or to speak more correctly the mine was run more in the interest of the superintendent's boarding-house than that of the owners. For that \$20,000 the owners have nothing to show but a double compartment shaft 110 feet deep and a drift run on the 100-foot level about 200 feet long. After this work was completed the mine lay idle for months until Mr. J. K. Mackenzie, our well-known ex-County Recorder, leased the property for six months. He has now been working about two months and has already demonstrated that the owners have a mine in every sense of the word. In two months work Mr. Mackenzie has taken out about \$10,000 worth of ore, on which he pays a royalty of 25 per cent. His last shipment sampled a little over \$300 per ton, and he now has a full carload of this grade of ore on the way to Kingman. Another well-known claim on Stockton Hill, and one which is credited with having produced in the neighborhood of \$100,000, is the Little Chief, owned by Johnny Kennedy, who has become rich from the proceeds of the work he has done on it. At the present time the mine is being worked under three leases. At the lower end of the claim Messrs. Taggart and Peasley are having a tunnel run in to tap the lead. These gentlemen made a small shipment of ore last week from which the returns were as follows: First class ore, one ton, 568 ounces silver; second class ore, two tons, 188 ounces in silver per ton. The Moonbeam is one of the richest ore producers on the hill, and adjoins the Cupel ground. This mine has produced about \$30,000 in the last year, but at this writing nothing but development work is being done. The Dictionary and adjoining claims owned by Messrs. Labarre and Moore are situated at the foot of the hill, and are good steady ore producers. The mine which is now attracting the most attention of any in the vicinity of Stockton is the Franklin formerly owned jointly by Caldwell Wright and William Engle. These parties segregated a few weeks ago, taking the center of the main shaft as a dividing line. This shaft is down about 65 feet, and in drifting south Mr. Engle has opened up what is by far the largest body of ore ever seen on Stockton Hill. The writer measured the ore at the bottom of the drift in the presence of Messrs. Luthy, Hardy, Conkey and Engle, and found it to be over seven feet wide. A sample taken across the ore streak for five feet, on the day previous, assayed 212 ounces in silver to the ton.

NEW MILL.—*Mohave Miner*, Oct. 4: Messrs. Stevens, Osgood & Co. owners of the well-known Ida mine in the Lost Basin district have contracted for a mill and concentrators, the machinery for which was to have been delivered at Hackberry last Saturday or Sunday. The mill and concentrators are to have a capacity of about 15 tons per day. All the timbers and lumber for it has been lying on the bank of the Colorado at Scanlan's Ferry for two or three weeks past, ready to be hauled to the millsite. Messrs. Stevens & Co. have also let a heavy wood contract to W. H. Gann who has already a large force of Indians at work gathering and cutting up drift wood. They have also a large force of men at work grading roads from the millsite to the river, and also to the mines in Lost Basin, and in addition have several teams hauling lumber and supplies from Hackberry. A large boarding-house is also to be erected near the mill, the lumber for which is on the road from Hackberry. The mill is to be erected on the Gann Spring millsite in the Wallapai wash, about half a mile from the Lost Basin mines. The possibilities for a mill in this district are immense, and with careful and economical management cannot fail to be a success. On the Ida mine Messrs. Stevens & Co. have eight men at work. There is about 200 tons of high-grade ore on the dump, and a large quantity opened up in the mine ready for stopping. When the mill is completed the force of men will be increased. There is an abundance of

ore in sight in the mine to keep the mill running for an indefinite period.

COLORADO.

ELK MOUNTAIN.—*Pilot*, Oct. 1: The Gray copper mine, which is supposed to be an extension of the Sylvanite mine, is looking very well. Mr. Hough, of Cleveland, Ohio, who recently purchased an interest, had some tests made of the ore by Burlingame, of Denver. One sample ran 264 ounces, and the other sample ran 1117 ounces. Garrett Fitzgerald has shipped two carloads of ore from the Little Daisy mine to the Gunnison smelter, and the first grade we believe, netted him about \$50 per ton.

CRYSTAL CITY.—There promises to be several good mining properties worked the coming winter, and so our camp is slowly pushing to the front. The Black Queen is in splendid ore and is giving a good income at present. Mrs. Jack is superintending the working of the mine. Andy Anderson and George Jones are taking out some fine lead ore from the London, and will make a shipment soon. W. L. Kingsbury has eight feet of carbonate ore in the Lead Chief and will take out a mill-run to Gunnison for a test.

AIR DRILLS.—*Idaho Springs News*, Oct. 3: Mr. Thoe. Keith was down from Dumont Tuesday, after supplies. He will have his air drills running about the middle of next week, on the Keith tunnel properties. He reports mining matters around Dumont as looking up. Several contracts have been made to sink upon the different mines. Mr. N. G. Stirm, of Denver, operating on the U. P. R. lode, just below the Champion mine, on Bellevue mountain, has taken a lease on the Osborne & Mumm 10-stamp mill on Fall River. A flume will be constructed at once, and within ten days the mill will be pounding away on the ores of the U. P. R., which is one of the largest and strongest fissure veins in the county, for the amount of development. Since taking the property a little over a month ago, the main adit level has been driven over thirty feet, making its length on the vein something like eighty feet. This has opened up considerable stoping ground, and ore enough with what is on the dump, to keep the mill constantly employed. Mr. Stirm, has also purchased for some of his friends the McCall properties on Fall river, three very promising looking properties. Men have been put to work, and good smelting ore is being taken out. Mr. Stirm has done more work in less than two months, in the way of opening up the U. P. R., building roads and getting things in working order, than most companies have accomplished in six months.

IRWIN.—Last week Charley Julian was kept busy hauling four carloads of ore, two of which came from the Forest Queen, one from the Ruby Chief, and one from the Bullion King. The Hopewell mine is being worked under a lease by Edgar Johnson. He has flumed the creek and got the shaft comparatively dry, so that he can work. He is satisfied that he will get pay ore from the start. The shaft at the Bullion King is being rapidly sunk by Wm. Bainbridge, who has the contract for sinking 50 feet. The Ruby Chief mine is looking well and producing some rich ore.

IDAHO.

LAVA DISTRICT.—*Wood River Times*, Sept. 30: There has been quite a noticeable improvement here, both in trade and mining interests, since the sale of the Horn Silver mine was finally consummated and work commenced to develop the property and resume the shipment of ore. It seems to be the intention of the company to ship all the high-grade ore, of which there are several carloads now on the dump, that they can, during the next month or two, and then suspend all but development work, during the winter. They are now working about 25 men, but will reduce their force to 8 or 10 as soon as the ore shipments are made. Mr. Egan, the superintendent, states that there is now ore enough on and near the surface to run a 20-stamp mill a year, and that his company will direct one in the spring. Considerable work is being done by the prospectors who have located the ground adjoining and contiguous to the Horn Silver, and alleged extensions are being found on every hill and in every direction for a mile around. John Ward and son are taking out ore of a good grade, and have a fine showing on the IXL lode, which is an extension property, though not claimed as an extension of the Horn Silver. The St. Louis, a high-grade galena lode, is attracting considerable attention, having shipped several lots of ore during the summer. Shipments have been recently made from half a dozen claims on Antelope Creek, and the results generally have been quite flattering.

BULLION.—*Idaho World*, Sept. 28: Charley Magee brought down five more bars of bullion from Banner last Tuesday. We stated in last Tuesday's *World* that the Banner mine had turned out 50 bars of bullion up to that date, worth about \$60,000. The number should have 58 bars. This makes 63 bars up to date. The 63 bars are worth \$92,000—assay value. The Banner mill, with 20 stamps, commenced crushing the latter part of July, and was stopped two or three weeks last month for repairs. The mill was shut down last week so as to make a complete clean-up, and the five bars brought down Tuesday is the final lot as the result of the run commencing July 26th. Ninety-two thousand in less than a month and a-half, is immense, and comment is unnecessary. Is there a mine in Idaho that can equal the Banner? We are of the opinion that this mine has made the best record so far this season. We received a letter from Banner yesterday after the above was "set up," from a gentleman who knows the figures. He gives them the same as given above, with this addition. The \$92,000 was produced from 485 tons of ore and the stamps ran only 49 days.

NEW MEXICO.

STARTED UP.—*Silver City Enterprise*, Sept. 30: One of the Hillsboro mills started up recently and made a successful run. The other mill of the camp will soon start up with a new concentrator which is expected to save all the gold. Bob Redding is hauling a lot of ore to the concentrator this week, from Lone Mountain, which camp will furnish many tons monthly towards supplying our reduction works in the future. We learn that a strike of extraordinarily high-grade ore was made upon the Old Man mine. The extent of the ore body was not learned but it is

said to be large. A contract was made by Shufeldt & Co., of the Silver City concentrator, for 80 tons of the second grade ore from the claim of T. N. Childers & Co., of Bear mountain, this week. Much of the ore is already upon the dump of the mine and the balance can be speedily broken.

COW SPRINGS DISTRICT.—Since a market for ores has opened up in this city and Deming, this district is again coming to the front, and will make a fine record towards swelling our county's output the present year. The claim of Laswell & Maher has a large body of 25-ounce ore that is of a very desirable character, besides having a two-foot vein that, without assorting, runs \$180 per ton, on the same claim. From reports this mine is a bonanza.

NEW CONCENTRATOR.—*Socorro Bulletin*, Sept. 29: W. C. Tonkin left on Thursday evening's train for Cleveland, to attend the meeting of the Grand Tower Mining Company, called to make final arrangements to erect a 20-ton concentrator on the site of the Grand Tower mine, in the Magdalena district. The present plant will be of such a nature that its capacity can be increased as necessity or the circumstances may demand. The Grand Tower mine is well situated for exploitation, and, like all the properties in the Magdalenas, can be worked the year round, regardless of the season, which is an important and economical factor. The prosperity of Socorro is based upon these immense ore lodes, and upon just such enterprises as this, which succeed each other as rapidly as the development of our camps and the progress of our mines warrant. Mr. A. D. Coon, general manager of the M. M. & Co., is employing 20 miners in the Merritt mine; the greater number of these are exploring and developing the property in a systematic manner. This is the proper course to follow, as a claim only becomes a mine when the work performed in it realizes a profit to those who exploit it. That the Merritt mine possesses a large body of paying silver ore is beyond dispute, and is admitted by good miners.

OREGON.

QUARTZ.—*Jacksonville Times*, Oct. 2: Considerable quartz of a promising nature is being taken out of the ledges on Wagner creek. There is considerable excitement in the vicinity of Jump-off-Joe over quartz recently discovered there. Prospectors are numerous. Geo. Howard, of Applegate, was over this week, and informs us that Keaton, Klippel & Co. are busily engaged in preparing for winter and expect to make an extensive run before next summer. S. F. Chadwick is at Gallice creek looking after his mining interests in the Yank ledge. Considerable work in the way of tunneling and prospecting is going on in that section. Fred Grob has done considerable work on his ledge on the south fork of Jackson creek, and has taken out sufficient quartz to make a good working test as soon as the new mill arrives. He is now improving the road to his mine, so that the ore may be hauled out to the mill without difficulty. Work at the Gaylord Bell-Moody mine on the north fork of Jackson creek is being steadily pushed and the owners have already on the dump a considerable quantity of ore which prospects very high. We have seen the assayer's certificate of two tests of this ore, and the indications are that Bell & Moody have struck it rich.

UTAH.

THE STORMONT CO.—*Southern Utah Times*, Sept. 28: The mill is crushing an average of 40 tons per day. The stopes in the Savage and Puckeye mines are showing up well and some fine ore is being extracted.

THE CHRISTY COMPANY.—The mill will continue to crush the regular quantity of ore, as the stopes in the California, judging from their present appearance, will furnish sufficient ore until relieved by the New Shaft. The drift running north and south at the bottom of the winze 250 feet north of the working-shaft in the California, is proving that the ore goes down. The winze below the 250-foot level in the New Shaft, has reached a depth of 157 feet, and a force of miners is now engaged in cutting out a station in which will be placed a small donkey engine to hoist the ore extracted from the stopes opened up by this winze to the 250 level. These stopes will not be worked again until the engine is in place and the necessary connections made, which will be in about four weeks' time. The body of ore opened up here is immense.

OTHER NOTES.—There are a number of chloriders at work on the west side of the White Reef, and their number will be largely increased by the time the new leaching works are in operation. A force of men are employed in taking out the old machinery at the Leeds mill, to make room for the new leaching works which will occupy the building.

MARSAC MILL.—*Park Record*, Oct. 3: At the Marsac mill everything is bustle and rush. The masons will probably have completed their work in another two or three weeks. The new brick smoke-stack will be completed in about a week, and will be nearly 135 feet high. Johnny Lenzi, who has the contract for the painting, commenced that work on Thursday. The whole mill, roof and all on the outside will receive two coats of brown mineral paint, and with the force of painters he intends to employ, will take him over a month to complete the job. The mill will be a fine one when completed, and there is little doubt that by Christmas it will be in operation.

CHRISTY.—*Southern Utah Times*, Oct. 5: The Christy mill closed down on the 1st inst. and will remain idle until the 15th. While there is sufficient ore in the California and Maggie stopes to keep the mill running, the managers of the company thought it advisable to refrain from crushing until the donkey hoisting engine can be put in place in the new shaft, when both mines can be worked together.

OTHER NOTES.—Both mills were running during the past week and crushed about the usual quantity of ore. Alphin Montgomery and Barbee are at work on the old Bonanza mine, in the White Reef, and have opened up a large body of low grade ore. All the old machinery will be cleared out of the Leeds mill this week, when preparations will be made to put the new rolls and tanks in position as soon as they arrive on the ground. Two new strikes were made in the Vanderbilt within the past week. The ore streak, opened up at the bottom of the incline is over eight inches in width and is high grade. The mine looks better than it ever did before, and is without doubt a bonanza.

HERCULES SLAYING THE GIANTS.

HERCULES POWDER

Derives its name from HERCULES, the most famous hero of Greek Mythology, who was gifted with superhuman strength. On one occasion he slew several giants who opposed him, and with one blow of his club broke a high mountain from summit to base.

HERCULES POWDER will break more rock, is stronger, safer and better than any other Explosive in use, and is the only Nitro-Glycerine Powder chemically compounded to neutralize the poisonous fumes, notwithstanding bombastic and pretensions claims by others.

No. 1 (XX) is the Strongest Explosive Known.

No. 2 is superior to any powder of that grade.

PATENTED IN THE UNITED STATES PATENT OFFICE

THE CALIFORNIA POWDER WORKS,

MANUFACTURERS OF

Sporting, Cannon, Mining, Blasting and HERCULES Powder.

ORDERS RECEIVED FOR HERCULES CAPS AND FUSE.

JOHN F. IOHSE, SEC'Y.

Office, No. 230 California Street, - - - San Francisco, Cal.

THE CONSUMERS' COMPANY.

Rubber Goods.

Lane and Bodley Saw mills.

H. W. Johns' Asbestos Packing, Paint, etc.

ENGINES and BOILERS

FROM 2 TO 100 H. P., ALWAYS IN STOCK.

A Full Line of MILL SUPPLIES AND LUBRICATING OILS.

DEWEY & CO.'S

Scientific Press Patent Agency.

Inventors on the Pacific Coast will find it greatly to their advantage to consult this old
experienced, first-class Agency. We have able and trustworthy Associates and Agents in Wash-
ington and the capital cities of the principal nations of the world. In connection with our edi-
torial, scientific and Patent Law Library, and record of original cases in our office, we have
other advantages far beyond those which can be offered home inventors by other agencies. The
information accumulated through long and careful practice before the Office, and the frequent
examination of Patents already granted, for the purpose of determining the patentability of
inventions brought before us, enables us often to give advice which will save inventors the
expense of applying for Patents upon inventions which are not new. Circulars of advice sent
free on receipt of postage. Address DEWEY & CO., Patent Agents, 252 Market St., S. F.
A. T. DEWEY. W. E. EWER. GEO. H. STRONG.

Metallurgy and Ores.

SELBY SMELTING and LEAD CO.,

JOHN TAYLOR & CO.,

IMPORTERS AND DEALERS IN

Assayers' Materials, MINE AND MILL SUPPLIES,

CHEMICAL APPARATUS AND CHEMICALS, DRUG
GISTS' GLASSWARE AND SUNDRIES, ETC.

114-118 Pine Street, San Francisco

We would call the attention of Assayers, Chemists
Mining Companies, Milling Companies, Prospectors, etc.,
to our full stock of Balances, Furnaces, Muffles, Crucibles,
Scorifiers, etc., including, also, a full stock of
Chemicals.

Having been engaged in furnishing these supplies since
the first discovery of mines on the Pacific Coast, we are
confident from our experience we can well suit the de-
mand for these goods, both as to quality and price. Our
New Illustrated Catalogue, with prices, will be sent on
application.

Our Gold and Silver Tables, showing the value per
ounce Troy at different degrees of fineness, and valuable
tables for computation of assays in grains and grammes,
will be sent free upon application. Agents for
Humbago Crucible Co., London, England.

(Continued from page 243.)

to the best interests of the people. The latter is, in my opinion, always dangerous, degrading and unfair to free labor, and this is aggravated when brought in contact with free skilled labor, for in the acquirement of that skill the intelligent freeman has spent the best years of his life, perhaps to find himself at last face to face with prison labor; to the maintenance of which prison and the sustenance of this very labor he has been compelled to contribute his share. I will not now enlarge on this subject this evening. It should be treated by able lips than mine, but I earnestly submit it to the attention of this association.

Local Industrial Depression.

From the foregoing perhaps the thoughtful man can draw some inferences and conclusions as to the causes of and remedies for the local and general industrial depression now existing. And whether the suggestions add anything to the common explanation of overproduction, which, while true as applied to specific things and specified periods, is not the whole truth, or to the concentration of power and wealth in fewer hands, or to the natural reaction from times of great industrial vitality and activity, I will not presume to say: but the cognate facts of dull times, reduced incomes and restricted commerce warn us to economize our expenditures by simplifying our habits, and to take advantage of dull times in business by fortifying our brain and body by reasonable activity, and while seeking for the causes of stagnation and depression in the vital and economic industries of the country, suggest, aye more, insist on the execution of remedial measures within the reach of corporation, State or General Government.

Another Process.

EDITORS PRESS:—I hear that an effort is being made to resuscitate the, so called, Mindelef, process which proved such a signal failure about ten years ago, in this city, when it was attempted to introduce it for the reduction of copper and other ores. This time it is the "Nickel ores which are to be metalized" by the magic touch of gas. The fallacy of this so-called discovery was so thoroughly exposed at that time in your paper (see 1876, pages 360 and 392) that the affair collapsed soon afterwards, and the reduction (?) works were shut up so quickly that some of the ores which had been sent there for treatment were never paid for.

San Francisco, Oct. 7th.

A VICTIM.

Mining Share Market.

Dullness continues to prevail in the mining stock market. The delay in the development of the middle Comstocks is displeasing to operators and affects the market unfavorably. When the much needed connection drift on the 3100 level of Chollar and Hale and Norcross, with that coming north from the combination west drift, is made and the drift put in good working shape, crosscutting west will be done in two or three places directly into the ore vein, when good results may be expected, judging from the good bunches and offshoots of ore cut through in skirting along the east bordering of the vein. Meanwhile the north lateral drift on the 3000 level of the Norcross from the deep winze station is again being pushed ahead in vein porphyry and quartz, and is now within 160 feet of the Savage south line. This is an important advance in favor of the Savage mine, as it penetrates directly into virgin ground, at a point where bonanza developments are believed to exist.

Bullion Shipments.

Moulton, Sept. 24, \$14,816; Alice, 28, \$21,920; Lexington, 20, \$29,080; Silver Bow, 30, \$13,872; Alice, Oct. 1, \$24,736; Moulton, 3, \$19,760; Oro Fino (Idaho), 2, \$30,967; Richmond Con., 2, \$14,571; from districts of Eastern Nevada, 2, \$34,344; Germania, Sept. 29, \$10,929; Hanauer, 29, \$7,000; Mayflower, 29, \$19,000; Honerine, 30, \$60,444; from Silver Reef, Utah, Oct. 1, \$34,433; Hanauer, 1, \$68,500; Crescent, 1, \$72,000; Queen of the Hills, 1, \$14,000; Stormont, 2, \$95,500; Hanauer, 3, \$35,000; Germania, 4, \$56,620; Ontario, 4, \$40,923. The banks of Salt Lake report the receipt for the week ending Sept. 30th, inclusive of \$83,730.49 in bullion, and \$28,243.10 in ore, a total of \$111,973.59.

Our Agents.

NEW BOOKS ON ASSAYING.

By C. H. AARON.

PART I.—Gold and Silver Ores.—Price \$1.

This new work is written by an experienced metallurgist who has devoted many years to assaying and working precious ores on the Pacific side of the American Continent. He writes, whereof he knows from personal practice, and in such plain and comprehensive terms that neither the scientist or the practical miner can mistake his meaning. The work, like Mr. Aaron's former publications ("Testing and Working Gold and Silver Ores," "Leaching Gold and Silver ores") that have been "successfully popular" is written in a condensed form, which renders his information more readily available than that of more wordy and less conscientious writers. The want of such a work has long been felt. It will be very desirable in the hands of many.

Table of Contents:

Preface; Introduction; Implements; Assay Balance; Materials; The Assay Office; Preparation of the Ore; Weighing the Charge; Mixing and Charging; Assay Litharge; Systems of the Crucible Assay; Preliminary Assay; Dressing the Crucibles; Scarcification; Cupellation; Weighing the Bead; Parting; Calculating the Assay; Assay of Ore Containing Coarse Metal; Assay of Roasted Ore for Solubility; To Assay a Cupel; Assay by Amalgamation; To Find the Value of a Specimen; Tests for Ores; A New Special Minerals; Solubility of Metals; Substitutes and Expedients; Assay Tables.

The volume embraces 106 12mo. pages, with illustrations, well bound in cloth; 1884. Price, \$1, postpaid. Sold by DEWEY & CO., Publishers, No. 252 Market street, San Francisco.

PARTS II AND III.

Lead, Copper, Tin, Mercury, etc. Price \$1.75.

This book is entitled "Assaying—Parts II and III," and is separate from Part I, and treats of Gold and Silver Bullion, Lead, Copper, Tin, Mercury, Zinc, Nickel, Cobalt, etc.

Table of Contents:

Gold and Silver Bullion; Apparatus; Melting Bullion; Assaying Bullion; Humid Assay of Silver; Manipulation, etc.; Lead Ores; Copper Ores; Volumetric Assays; Partic Process; Amalgamation; New Process; Preparation of Potassium Zanthate; Electrolytic Determination of Copper in Ores, etc.; Assaying of Tin Ores; Assaying of Mercury Ores; Assaying of Zinc Ores; Assaying of Zinc Ores, New Method; New Assay of Nickel and Cobalt; Assay of Chromite; Assay of Bismuth; Assay of Arsenic; Assay of Antimony; Assay of Sulphur; Assay of Salt; Appendix to Part I; Notes on Crucible Assays; Weighing by Oscillations; Appendix to Part III; The Assay of Lead; The Assay of Copper.

The are 160 12mo. pages, with illustrations in the volume, which is bound strongly in cloth. Price postpaid, \$1.75. Sold by DEWEY & CO., Publishers, No. 252 Market St., S. F.

These are much needed books for miners and other practical men, by an intelligent miner, assayer and careful writer. They are invaluable for the mill and mine worker, and equally good for scientific experts. They are thoroughly practical books.

Complimentary Samples.

Persons receiving this paper marked are requested to examine its contents, terms of subscription, and give it their own patronage, and, as far as practicable, aid in circulating the journal, and making its value more widely known to others, and extending its influence in the cause it faithfully serves. Subscription rate, \$3 a year. Extra copies mailed for 10 cents, if ordered soon enough. If already a subscriber please show the paper to others.

Market Reports.

 327,205.—WATER ELEVATOR.—J. W. Thorp, Dayton, W. T.
 327,121.—WINE PRESS.—J. B. Tupper, Jr., Petaluma, Cal.
 327,048.—SAFETY ATTACHMENT FOR ELEVATORS, ETC.—F. Whiram, S. F.

NOTE.—Copies of U. S. and Foreign patents furnished by Dewey & Co., in the shortest time possible (by telegraph or otherwise), at the lowest rates. American and Foreign patents obtained, and all patent business for Pacific Coast inventors transacted with perfect security and in the shortest possible time.

Notices of Recent Patents.

Among the patents recently obtained through Dewey & Co.'s SCIENTIFIC PRESS U. S. and Foreign Patent Agency, the following are worthy of special mention:

MOWER.—Wm. S. Halsey, assignor to Judson Manufacturing Co., Oakland. No. 326,643. Dated Sept. 22, 1885. This invention is in that class of mowers in which the sickle or knife is driven by power derived from the wheels and transmitted through suitable shafts and gears; and the invention consists in a sleeve loosely mounted on the counter-shaft, which carries the bevel gear, said sleeve having at one end a collar, against which the heel of said gear bears, and at its other end a set screw, which is seated in the yoke mounted on the counter-shaft, and which carries the shaft which bears the pinion engaging with the gear. The arrangement is such that no matter how strong the thrust may be, it but throws both gear and pinion in the same direction, and to the same distance, whereby their engagement is not broken.

SAW-GUMMER AND SHARPENER.—Squire J. Randall, Moodyville, B. C. No. 326,243. Dated Sept. 15, 1885. This grinder or sharpener consists in a table or stand, a swinging bracket pivoted thereto and carrying the driving arbor with grinding wheels; peculiarly adjustable holders for long and circular saws, and adjustable supports for the blades of the saws. It consists, further, in the combinations of these devices, in their peculiar and particular arrangement, and in various details relating to their adjustments.

CHECK-REIN AND POST HOOK.—C. L. Bard, San Buenaventura. No. 327,058. Dated Sept. 29, 1885. This is a check-rein attached in front to the usual head gear, and at its rear end to the driving lines at a point behind the plane of the pad and provided with a hook, and in a peculiar post on the pad through which the check-rein passes, and with which the hook on said rein engages.

CABLE RAILWAY.—Egbert D. Haven, S. F. No. 327,083. Dated Sept. 29, 1885. The object of this improvement is to provide a device by which the gripman can drop and pick up the cable and pass over switches and crossings without the aid of switchmen and without any dips in the grade of the streets or hands in the cables. It would be difficult to give an intelligent description of the device without the aid of suitable engravings.

TWO-WHEELED VEHICLE.—Lewis St. Ores, Guadalupe, Santa Barbara county, Cal. No. 327,036. Dated Sept. 29, 1885. This invention in carts consists in a peculiarly divided sectional shaft, and in details of construction relating to the adjustment or control, the limitation and the guiding of the joint formed between the section. The object is to do away with the unpleasant rocking motion which the body receives from the shafts, and which is occasioned by the joggling of the horse.

FOLDING BED.—B. F. Farrar, S. F. No. 327,077. Dated Sept. 29, 1885. The invention consists in the particular arrangement and construction of guide straps by which the legs and leg-frames of the bed are kept in an upright position, and in the stops by which these guide straps are limited in their movement, to enable the legs of the frame to come to their proper position. It consists, further, in certain details of construction pertaining to the limitation of the mattress and the general cabinet structure of the bed.

Inducements to Subscribers.

To favor subscribers to this paper, and to induce new patrons to try our publication, we offer the following advantages to all new subscribers who pay one year in advance, or present subscribers who will pay their subscriptions up to a date fully one year in advance of the present time. We will furnish the following articles (while this notice continues), at the reduced rates named, viz.:

- | | REGULAR PRICE. |
|--|-----------------------------|
| 2.—World's Encyclopedia, 794 pages, with 1,200 illustrations, worth \$1.75. | Postpaid for 50 cts. |
| 3.—Patent Binder (cloth cover) with name of this paper in gilt. | Postpaid for 50 cts. \$1.00 |
| 6.—To New Subscribers, 12 select hack Nos. of the MINING AND SCIENTIFIC PRESS. Free | .75 |
| 7.—Any of Harper's first-class periodicals, 15 per cent less than regular rates. | |
| 8.—Frank Leslie's and most other U. S. periodicals, 15 per cent discount from regular rates. | |
| 9.—Pacific Coast and Eastern Dailies, Books and Periodicals, except special publications, we can usually give 10 to 15 per cent less than advertised retail rates. | |
| 10.—Pictorial Arizona, 350 pages, in cloth and gilt. | Postpaid for 25 cts. 1.25 |
| 11.—California, 100 pages, Magazine, 1880 to 1882 (3 Vols.) single Nos. | Postpaid for 3 cts. .35 |
| Per volume, unbound, 5 Vols. | Postpaid for 20 cts. 2.00 |
| Per volume, bound, cloth back and stiff paper sides. | Postpaid for 40 cts. 2.50 |
| 13.—Picturesque California Homes (40 building plans and estimates). | Postpaid for \$1 3.50 |
| 14.—Dewey's Patent Newspaper File Holder (18 to 36 inch). | 25 cts. .50 |

NOTE.—The cash must accompany all orders. If too much is sent for any article or publication, the balance will be returned immediately. Address this office, No. 252 Market St., S. F.
 P. S.—No. 11 is really a valuable premium to newcomers and others who appreciate the better class of stories and a good standard of California literature. Webster's Dictionary, 634 pages, with 1,500 illustrations. 50 cts. 1.50
 Grant Lithograph, size 24x12. 50 cts. .50
 Cleveland Fine Steel Plate, size 12x16. 10 cts. .50
 Orant Steel Plate, cabinet size. 5 cts. .25
 De Groot's History of Mining in California. 5 cts. .25
 Beautiful Poetic Review, a handsome, entertaining and instructive souvenir of real merit. 25 cts. .50
 Send for any further information desired. Readers will please inform their new neighbors and others concerning our paper and these offerings. On application, sample copies of this paper will be mailed free to the address of any persons thought likely to subscribe.

Very Acceptable Present.

Stereoscopic and Cabinet Views.

We are Sole Agents for the Pacific Coast for the views of the Continent Stereoscopic Company, consisting of a most complete series of photographic views of all popular localities west of the Rocky Mountains. They represent all the principal localities of the Pacific Coast, including views in

California, Oregon, Alaska, Arizona, New Mexico, Colorado, Mexico, Columbia River, City of San Francisco, Washington Territory, Union Pacific Railroad, Nevada and the Northwest, And Types of Indians of all Races.

Send for a sample hundred of our views, which will give you an idea of the quality of our goods. New subjects from all sections are constantly being added.

Price \$8 per hundred. Liberal discount to the Trade.

We want to particularly inform those heretofore using these goods that the line has just been revised, with new Subjects, both Cabinet and Stereoscopic. We respectfully solicit your patronage.

HOOD'S FOUNDRY COKE.

Consumers are respectfully informed that owing to inferior brands of Coke having been sold
in this and other countries under the name of "Patent Coke," the Glamorgan Coal Co.
(Limited), Cardiff, in May, 1884, abandoned the title of "Patent Foundry Coke," substituting
that of "Hood's Foundry Coke."

This Coke is exclusively used by the Selby Smelting and Lead Co., Union Iron Works,
Professor Thomas Price, and other consumers here. Large quantities are regularly forwarded
to Copper Smelters in Arizona and New Mexico, and also to consumers in Nevada and Salt Lake.

The undersigned are the SOLE IMPORTERS of the above Coke, which is for sale in quanti-
ties to suit purchasers.

BALFOUR, GUTHRIE & CO.,

F. A. HUNTINGTON'S CENTRIFUGAL ROLLER QUARTZ MILL.

Economy in Expense of Plant. Economy in Cost of Working. Economy
in Saving Gold. Economy in Transportation of Machinery.

Economy in Cost of Erection of Mill at Mine. Econo-
my in Time Required to Establish Plant
(one day only being consumed).

The Huntington Mill has passed entirely through the experimental stage. Two years of
continuous use at a number of mines in California has enabled the inventor to perfect and im-
prove the machinery until he feels justified in assuring the public that he has reached THE ABSO-
LUTE in the construction of a perfect Quartz Mill.

THE JENKINS STANDARD PACKING

IS ACKNOWLEDGED BY USERS AS THE BEST in the
world. Unlike all other Packings, the Jenkins Standard
Packing can be made any thickness desired in a joint by
placing two or as many thicknesses together as desired, and
following up joint, it vulcanizes in place and becomes a
metal of itself (it is frequently called Jenkins Metal), and
will last for years, as it does not rot or burn out. Avoid all
imitations, as a good article is always subject to cheap imi-
tations. The genuine has stamped on every sheet "Jen-
kins Standard Packing," and is for sale by the Trade
generally.

Manufactured only by

RANKIN, BRAYTON & CO.,
BUILDERS OF
MINING MACHINERY.

San Francisco: Chicago: New York:
100 N. Clinton. 145 Broadway.

PLANTS FOR GOLD AND SILVER MILLS,
embracing machinery of LATEST DESIGN and
IMPROVED construction. We offer our cus-
tomers the BEST RESULTS OF 35 YEARS' EX-
PERIENCE in this SPECIAL LINE of work, and
COMPARED to furnish from SAN FRAN-
CISCO, the MOST APPROVED
character of MINING AND REDUCTION MA-
CHINERY, adapted to all grades of ore and su-
PERIOR to that of any other make, at the LOWEST
POSSIBLE PRICES.
We are also prepared to CONSTRUCT and DE-
LIVER in COMPLETE RUNNING ORDER,
in any locality, MILLS, CONCENTRATION
WORKS, WATER JACKET SMELTING
FURNACES, HOISTING WORKS, PUM-
PING MACHINERY, ETC., ETC., of any DE-
SIRE CAPACITY.

WATER JACKET SMELTING FURNACES

For COPPER and ARGENTIFEROUS LEAD
ores of NEW and ORIGINAL DESIGNS, covered
by LETTERS PATENT. No other Furnace CAN
COMPARE with these for DURABILITY, and in
CAPACITY for uninterrupted work. MORE
THAN 150 of them are now RUNNING in various
parts of THIS COUNTRY, as well as many in
FOREIGN COUNTRIES, giving results NEVER
BEFORE ATTAINED as regards CONTINUOUS
running, ECONOMY of fuel, AMOUNT and QUAL-
ITY of BULLION produced. These CLAIMS have
been PROVEN BY RESULTS in ANY NUM-
BER of INSTANCES, and the GREAT SUPE-
RIORITY of this SYSTEM of smelting ores DE-
MONSTRATED BEYOND QUESTION. COM-
PLETE PLANTS furnished to order of any CA-
PACITY, with ALL IMPROVEMENTS that ex-
perience has DEMONSTRATED as VALUABLE
in this class of work.

Beyond question the cheapest and
most effective machine of the kind
now in use adapted to all grades and
classes of ores.

This machine has been THOROUGHLY TESTED
for the past TWO YEARS, under a GREAT VA-
RIETY of CONDITIONS, giving most EXTRA-
ORDINARY results FAR IN ADVANCE of
anything EVER BEFORE REALIZED. A re-
cent COMPETITIVE TEST at the Carlisle Mine in
Mexico, showed an ADVANTAGE OF OVER 30
PER CENT in favor of THE DUNCAN. The
amount SAVED OVER THE TRUE being suffi-
cient to PAY THE ENTIRE COST of the ma-
chines EVERY MONTH OF THE YEAR. One
of its MOST VALUABLE features is as an AMAL-
GAMATOR. It saves ALL THE AMALGAM GOLD
AND SILVER that ESCAPES the BATTERIES,
PANS or SETTLERS, making the machine worth
MORE than ITS COST for THIS PURPOSE
ALONE.

Baker's Mining Horse Power.

Possessing all the requirements of a first-class hoist,
and affording means for the continuous operation of a
Pump or Blower, without interfering with a hoisting ap-
paratus. It is made entirely of iron, no piece weighs
over 300 pounds. At the ordinary speed of a horse, a
1,000-pound bucket of ore may be raised 120 feet per
minute. The hoisting-drum is under the complete con-
trol of the man of the shaft, and is capable of carrying
500 feet of five-eighths steel rope. SEND FOR CIRCULAR.

\$1,000 CHALLENGE!

**THE FRUE ORE CONCENTRATOR,
OR VANNING MACHINE.**

PRICE: FIVE HUNDRED AND SEVENTY-FIVE DOLLARS,
(\$575 00), F. O. B.

OVER 1,000 ARE NOW IN USE. Saves from 40 to 100 per cent more than any other Concentrator Concentrations are clean from the first working. The wear and tear are merely nominal. A machine can be seen in working order and ready to make tests at the Fulton Iron Works, No. 220 Fremont Street, San Francisco.

As the result of a suit East against an End-Shake Machine (the Embrey), similar to the Triumph, the Frue Vanning Machine Company owns the Embrey patent, and can put in the market an End-Shake Machine of earlier patent that will do as good work as the Triumph, and superior in construction and durability. There will be no risk of suit for infringement.

The Frue Vanning Machine Company warn the public that they claim and will prove the Triumph machine to be an infringement on patents owned by them.

Protected by patents May 4, 1869, Dec. 22 1874, Sept. 2, 1879, April 27, 1880, March 22, 1881, Feb. 20, 1883, Sept. 18, 1883. Patents applied for.

N. B.—We are and have been ready at any time to make a competitive trial against the Triumph, or any other Concentrator for stakes of \$1,000.

ADAMS & CARTER, Agents Frue Vanning Machine Co.,

Room 7—No. 109 California Street,

SAN FRANCISCO, CAL.

\$1,000 CHALLENGE ACCEPTED!

PRICE, FIVE HUNDRED AND FIFTY DOLLARS
(\$550.00), F. O. B.

THE "TRIUMPH" TRIUMPHANT!

**THE
"TRIUMPH" ORE CONCENTRATOR.**

In a competitive trial recently had between two of the "Triumph" Ore Concentrators and the same number of "Frue" Vanning Machines, at the mill of the celebrated gold producing Original Empire Mill and Mining Company, in Grass Valley, Nevada County, Cal., the "Triumphs" produced thirteen and fifteen one-hundredths (13.15) per cent more concentrations than did the "Frue" Vanners, during a run of twenty-four consecutive days, or a net gold coin result of \$199.15, or \$3.30 per day, in favor of the two "Triumph" Concentrators.

These returns do not include the value of the amalgam saved by the "Triumphs" during the test; which will add to the net gain. The form of construction of the feed bowl is such that considerable amalgam is necessarily saved, which is lost on the "Frue" Vanners. This trial was conducted under the personal supervision of the Manager and Superintendent of that Company, in a strictly fair and impartial manner, and with the sole view of determining, in the interest of that Company, the merits and demerits of the respective machines by a thoroughly practical test. A relation of the course of procedure, a concise analysis of assays, and a tabulated statement of the net bullion results, with accurate deductions therefrom, will soon be published in Circular form.

The superiority of the present construction of the "Triumph" over the form originally introduced, together with the demonstrated results of the above, and other trials had with the "Frue" Vanners, induce us to and we hereby accept the Challenge of \$1,000, flouted by the Agents of the "Frue Vanning Machine Company," and hold ourselves in readiness to enter into a second competitive trial for that sum, at such place and upon such terms and conditions as may hereafter be mutually arranged.

We guarantee purchasers against all costs, expenses or charges incurred by reason of any infringements of any existing patents.

"Put up or shut up," and "Let the Best Machine win!"

VOLUME LI
Number 16.

The Davey Safety Engine.

The Davey safety engine, or vacuum motor, of which we present an engraving, is an invention of Henry Davey, Esq., the well-known English mechanical engineer, the inventor also of the differential pumping engine. The motor possesses some remarkable features especially adapting it to such branches of industry as require a small, cheap and positively safe power.

The Davey safety engine differs from an ordinary steam engine in the fact that while a small quantity of steam is made in the generator, which is a part of the machine, steam is not the motive power employed to do the work, and only as much is made in the smaller sizes as would be generated in a large teakettle, and this at only atmospheric pressure; that is, at the same pressure at which it would flow from the spout of a teakettle, or escape from under a pot lid; the only function of the steam being to create, by condensation, a vacuum, which is the motive power. The engine is double-acting, a vacuum being created alternately at each end of the cylinder. There is absolutely no pressure in the generator, and consequently can be no danger of explosion, under any circumstances whatever.

The condensation of the low pressure steam, by which a vacuum is created, is effected by means of a surface condenser, which is kept cool by water. Where the engine is to be used in a city or town having a public water service, the condenser is placed in the upright iron pocket shown at the back of the engine, and a small stream of water, one-eighth inch pipe (the smallest size iron pipe made) for the one-horse power; for the two-horse power, one-fourth inch; for the four-horse power, one-half inch pipe furnishes an abundant water supply to keep the condenser cool. The water is admitted at the bottom and rises to the top, and passes off through an overflow pipe.

Where it is desired to use the engine in localities having no running water, the condenser is placed in a wooden tank located in any convenient place within a few feet of the engine, and connections made with the engine by means of pipes. This tank being once filled, there is no consumption of water except the amount that flows out of it to support the generator. The quantity actually consumed in this way is very small, only a trifle over three gallons per horse-power per hour, which is evaporated in the generator, and is condensed and discharged in the form of distilled water from a little pipe at the side of the engine. If it is desirable to save this water, it may be allowed to stand until cool, and then returned to the tank to be used over and over again. When arranged in this way there is no actual consumption of water, and the tank, once filled, will last for months without the addition of a gallon.

The cylinder, unlike that of an ordinary engine, does not require oiling or lubrication, being made of bronze, with bronze piston-head and piston-rod. The low steam used being very moist is a sufficient lubricant. Another advantage of the use of a bronze cylinder is that if the engine stands for months without being used it suffers no deterioration from rust. The quantity of fuel needed is much less than would be used in the ordinary engine, as the amount of water to be evaporated is less than half that consumed by the ordinary slide valve engine of same power, and the water is raised to only 212

degrees, instead of 300 to 340, as in an ordinary boiler. The small amount of water necessary to be evaporated, and the low degrees of temperature to which it is necessary to raise it, accounts for the economy of fuel in these motors, and there is but little precipitation of lime in the generator, as the water is not raised to a sufficient degree of temperature to produce it.

Unlike an ordinary boiler and engine, in which the water level in the boiler is a matter

into the fire box; either soft or hard coal, wood-coke, or cobs. Petroleum, naphtha, or common gas can be used by a proper arrangement of pipes in the fire box. The quantity of fuel needed is surprisingly small, as the amount of water to be evaporated is quite limited, and if hard or soft coal or coke, the cost, it is claimed, will not exceed one cent per horse power per hour. There is no boiler tubes to burn out and leak, and no scaling of the boiler. It requires no watching, does not increase the rate of in-

THE DAVEY SAFETY VACUUM ENGINE.

of vital importance, and any failure of the water supply fraught with more or less danger, the water level of the Safety Engine is constant and unvarying, the feeding arrangement being automatic, and the quantity of water actually consumed so small as to remove all difficulty of keeping up a supply.

Aside from the question of danger attending the use of the ordinary steam boiler under careless management, there is probably no one thing which will commend this motor more strongly to the public than the fact that it requires no attention beyond simply keeping up the fire, and giving the wheel two or three turns when ready to begin operations. There is no safety valve, no exhaust, no steam gauge, no gauge cocks, no boiler feed pump or injector, or any of these adjuncts of an ordinary steam engine.

Anything may be used for fuel which will go

surance, as the risk of fire is no greater than that from an ordinary house stove, and can be arranged by a person having no knowledge of steam engines. Owing to the fact that there is no pressure to deal with, the generator is made entirely of cast-iron, so it cannot be burned out and made to leak, even if perfectly dry with a fire burning in the furnace.

The manufacturers claim it to be superior to the hot-air or gas engine. It is practically noiseless, has no exhaust, and there is no odor. There is no steam pressure, no explosion possible, and no engine required. The motor can be started in from 10 to 20 minutes after lighting the fire. The engine is controlled by an ordinary fireman. The working parts are as durable as those of any well-constructed steam engine. Tatum & Bowen are sole agents for the Pacific Coast.

Fluxes and Fuel for Smelting.

At Leadville, where the numerous smelting establishments produce annually about \$15,000,000 worth of argentiferous lead bullion, metallurgists have acquired an unusual amount of practical experience in the conduct of the operations of smelting and the business connected with it. The fluxes used at Leadville are limestones and hematite. The limestone mainly used was formerly the blue dolomitic limestone in which the Leadville ores occur, taken either from the open quarries or from deadwork of some of the mines. In the latter case it often carried a small percentage of silver. Experiments showed that dolomite was a less favorable flux than pure carbonate of lime, and since the advent of the railroad limestone has been obtained from the beds of the Colorado cretaceous formation at Carson City, 117 miles distant, or from Robinson, 16 miles distant. Red hematite iron ore was at first used exclusively as a flux. More recently it has been the practice in many smelters to use the limonite which had collected on the dumps of various mines. In many cases the ores themselves carry so much iron that but little additional is required.

The fuels used are coke and charcoal. Before the railroad was built charcoal was more largely used than at present. This is furnished by the forests of spruce covering the neighboring mountain slopes. The pit charcoal is said to contain 2.5 per cent of ash; a sample of kiln charcoal was found by Mr. Guyard to contain 1.62 per cent of ash. Mr. S. F. Emmons, who collected this data, states that the coals used are brought from El Moro, in the southern part of Colorado, by rail, and also from Como, in the South Park. These coals are made from the coals of the lignitic or upper cretaceous formation, and contain, according to determinations made at the smelting works of Messrs. Billings & Eilers, 22 per cent of ash for the El Moro and 9½ per cent for the South Park coke. About 40 pounds of coke make a bushel.

Aspen, Colorado.

The attention of mining people in Colorado is now being strongly directed toward Aspen, the booming camp of Pitkin county, by reason of the rich mineral discoveries recently made in that vicinity. Outside of Leadville the daily output of the camp is greater than any other in the State, and were it not for some unfortunate litigation that a few of the principal properties have got into, the shipments would be much larger and the influx into the town much greater. Even as things are, the product of Aspen for the present year will run well into the millions. Denver is the best point from which to reach Aspen and the Union Pacific Railroad is running its trains so as to make the trip as convenient as possible. Leaving Denver at 7 o'clock in the evening St. Elmo is reached at 6 the following morning, from which point a stage ride of 12 hours brings a person to Aspen. The scenic beauties of the ride are an ample compensation for the expenses of the trip. A splendid line of Concord coaches runs each way daily from St. Elmo to Aspen. Each of these vehicles is capable of carrying 11 passengers besides a ton of baggage without overcrowding the conveyance. These coaches are a model of ease and elegance for riding in, and it is worth the fare to make the trip if a person has never ridden in a Concord coach.

CORRESPONDENCE.

We admit, unendorsed, opinions of correspondents.—EDS.

Grass Valley.

Its Past History, Present Outlook and Future Prospects.

[Written for the Press.]

Grass Valley is the largest and most prosperous gold quartz mining district in the State of California. It is situated in Nevada county, about the center of the great gold belt traversing the foothills of the western slope of the Sierra Nevada mountains. It is distant from San Francisco some 160 miles by rail, taking the Central Pacific railroad from San Francisco to Colfax, a distance of some 144 miles, and the Nevada county narrow gauge, 16 miles from Colfax to Grass Valley, occupying in all some twelve hours' travel from San Francisco to Grass Valley, and is about the only camp in the State directly connected by rail with San Francisco and the great cities of the East. Its discovery dates back to 1849, and its name of Grass Valley was given to it by the first batch of pioneers that, wearied by a dull trip of nearly 20,000 miles, rested as they had not rested since the passage of the Missouri river. Here they found a verdant valley coursed by a beautiful stream unruffled by the labor of the prospector. Now the town covers the valley and the stream is turged with the tailings of many mills and placers. The first settlement was made on Badger hill, about one half mile east of the present town site. In the spring of 1850 placer mining was carried on with good results at Ohio Flat and Rhode Island and Boston ravines. Quartz, which has made Grass Valley world renowned, was not discovered until June, 1850, some seven or eight months after the opening of the placer mines. The discovery was first made by a man named McKnight, on Gold hill. Following this came the discovery of quartz on Massachusetts hill, in the same neighborhood, and a great quartz excitement prevailed. In 1851 the shallow surface diggings were beginning to show signs of exhaustion, and prospectors were running over the hills in every direction in search of ledges. Now commenced an era of grand success and great profligacy and lawlessness; gambling saloons arose in splendor and magnificence, and were daily and nightly thronged, pistols and knives were worn and drawn, murders were committed and fights were common; Judge Lynch held court, and if his rulings were not always correct or dignified, his promptness was never questioned, varying his sentences from a tight collar to thirty-six lashes on the bare back for stealing a mule, explaining that the punishment was not awarded for stealing that particular quadruped, but "that mules may not be stolen." From the contemplation of that picture we now turn to behold the metamorphosis. A wild and rugged region subjugated from nature, which has yielded more gold than any other spot of like extent on the globe; a town of nigh 7000 inhabitants, a collection of happy homes, containing more children in ratio of its population than any other town in California.

Here in 1853-4 lived the erratic Lola Montez. Her eccentricities and escapades were numerous and varied. Her most notorious adventure was her street attack upon Henry Shipley, editor of the Grass Valley Telegraph. He had published something severe on one of Lola's ballet friends, and the irate actress provided herself with a whip, found Shipley, made a few belligerent passes at him, but was taken away before doing any serious damage to her surprised victim. Like all the mining districts of California, Grass Valley suffered its ups and downs, its early tribulations from fires and floods, but owed its setbacks more to unsystematic and irregular mining than to any other cause. Notwithstanding all these, the output of the mines of Grass Valley and their well-known richness in former times should encourage explorations in depth and extent with every reasonable expectation of an ample reward for the outlay.

Leaving historical and general considerations, let us turn our attention to a limited number of mines and their output which will best illustrate the productiveness and great richness of the veins of this district, appending a list of mines which have all produced in the plural number of millions:

Eureka	over	\$7,000,000
Idaho	7,000,000
Empire	7,000,000
Allison Ranch	4,700,000
Rocky Bar	4,500,000
Gold Hill	4,000,000
North Star	3,000,000
New York Hill	3,000,000
Scadden's Flat	2,000,000
New Rocky Bar	2,000,000

I could tabulate scores of others that have produced over a million of dollars. It is an astonishing showing, and the more so if we take into our calculations what is currently believed here that fully as much more gold as above credited was carried off by the early miners by way of stealing specimens in their boots, lunch buckets and by divers other contrivances, and as these were mostly chunks of almost pure gold it is not at all improbable that the above figures may be nearly doubled in gross product of the mines. A story is told of a miner who went to work on a Monday morning in a new mine, quitting on a Friday of the same week, having in the mean time accumulated a large fortune.

Professor Benjamin Silliman, in his notes on the Grass Valley district, says: "This place has obtained a well-earned celebrity as the most prosperous of all the gold quartz mining districts in California."

Wm. Ashburner, Esq., in his remarks on the gold mining interests of California in J. Ross Brown's Report on the Resources of the States and Territories west of the Rocky mountains, speaks of the Grass Valley region (page 46) thus: "When we consider the richness of the veins, the length of time some of the mines have been worked, and the amount of gold annually produced, the most important quartz mining region of California is, without any doubt, that of Grass Valley in Nevada county." I quote the above distinguished authorities in support of my testimony as to the permanence, prosperity and richness of this district.

Another important feature in connection with these veins is the fact of their increasing in extent and richness as depth is attained; in this respect they resemble the silver mines of Spain and the tin mines of Cornwall. I find at this time the "Idaho" working on its 1600-foot level, paying monthly dividends without a single interruption in years, and aggregating in the immediate neighborhood of \$4,000,000, working its lowest levels entirely, from which portion of the mine rich specimens are being extracted daily; in the company's mill there is a complete outfit of machinery for the treatment of these specimens by a separate process. The Empire is also working on its 1600-foot level on a chute of ore over 2000 feet in width. This is a private corporation, and but little is known on the outside of its actual resources further than that it is paying largely, and by many here it is believed to be at this time the richest mine in Nevada county, if not in the State of California.

The North Star is working its 1400 foot level, and the New York Hill its 1300 foot level; this is certain proof of the permanence of these veins and their continued richness from grass roots down. Notwithstanding the foregoing showing of undisputed facts, it is a most astonishing circumstance that many of the mines of this district are now lying idle and neglected, many having so remained for the past 20 years; and for no other reason that I can perceive than the simple fact that they have been worked from the surface and all along their surface, down to water level, a depth of some sixty feet. The lack of energy and capital to place upon them suitable pumping and hoisting machinery, is the only cause of their being at the present standstill, for they are still rich in the bottom, and the millions extracted from the deep worked mines here lie hidden and expectant of the stroke of the pick that shall open their prison door. This is the more reprehensible, inasmuch as these dormant mines were not "disastrous failures," nor were they the cause of any loss whatever to their owners; on the contrary, they had yielded immense amounts of money to their workers. True, they have been coyoted and gouged out of all mining shape, worked on shares, on tribute, on leases, on bonds, each party so working living from hand to mouth, and some more lucky ones striking rich pockets, which were either riotously spent, hawked or invested: but never a cent returned to the mine for intelligent opening, and this system is too much in vogue here, even at the present day.

I have followed little rat hole drifts, at the end of which the ledge had been picked like a series of gimlet holes, and then abandoned by the tributaries for a warmer place and looser ground. I know of a large number of these mines that paid very profitably at a time when mining labor was \$5 per day, and at that no one knew how to open a mine, no one knew how to amalgamate properly, saving sulphurets was not thought of, and the mill was a rattle-trap concern that failed of crushing the rock; these very mines at the present day with our mining and milling facilities, improved gold saving apparatus, and cheapened labor would turn out a fortune to their owners. The suspended activity of these mines is certainly due to causes quite unconnected with their intrinsic values. Of late, however, I note renewed activity—a new awakening dawning over and pervading the whole district. Some six or seven of these quiescent mines are being rapidly equipped with powerful machinery capable of sinking to great depths, and this principally with local enterprise and capital. Of these I shall write more fully in future communications. I shall also treat upon the general geological character of the district, the structure of the gold-bearing veins, the average tenor of the gold, the value of the sulphurets and their treatment, length and depth of productive ore ground, extent of explorations, etc. At the present time I find some 10 quartz mills in active operation, aggregating 150 stamps, and giving employment to fully 1500 men in both mines and mills.

In concluding this letter I would state that Grass Valley of to day is one of the pleasantest spots of earth to live in, trees, plants, and delicious fruit luxuriate, the town and residences hidden in umbrageous foliage, having more the appearance of a tropical forest than the usual rugged and arid mining camp. The climate is warm, mild and balmy, and outside its mineral industry and wealth, this section of country would form a grand sanitarium for the invalids of the world.

H. E.

THE Coral, which arrived Monday from the Arctic, is the first of the whaling fleet to return. Her cargo consists of 1600 pounds of bone and 1600 barrels of oil, representing a catch of 12 whales.

Humburg Mining District.

[Written for the Press.]

This district lies midway between Prescott and Phoenix and on the southern spur of the Bradshaw range of mountains, Arizona. There is an open country on the south with good roads from the Southern Pacific R. R., via Phoenix, to within eight miles of the center of the district.

Supplies for this district and the output of the mines are from and to the S. P. R. R.; the distance is 75 miles. The expense for transportation of ores from Humburg district to the S. P. R. R. is \$27.50 per ton; from Maricopa to Pueblo, Colorado, is \$12.50 per ton; for milling the ore at Pueblo is \$11 per ton.

This district has abundance of water all the year round for reduction of its ores. The Cottonwood, Humburg, Boulder and Tully creeks are its sources of water supply. There is good pine timber within nine miles and of easy access by wagon road, being down bill most of the way to the mines. This district has produced more bullion than any other district in Yavapai county; it is to-day the best poor man's camp in the Territory, as good wages can be made on any of the mining properties. Mine owners are paying \$3.50 to \$4 per day wages.

New life seems infused into this camp through the commendable enterprise of Wager Bros., merchants at Tip Top. These parties are buying all ores offered, and paying 90 per cent of assay value of the same.

The effect of this has been to set many owners of small means at work on properties that have lain idle for the past two years, and this camp is again becoming quite lively. Several mines, by recent development, have shown up rich ore bodies that have created new interest in the camp and interested several parties of Eastern capitalists in three different properties here, that in a few weeks will employ a large number of men in their new development. The formation here is micaceous granite, the veins are well defined and regular, with sulphide, sulphurets, chlorides and carbonates.

A Good Smelter

Located at the mouth of Tully creek for custom work, with an expenditure of a few thousand dollars on a road from the smelter into Tip Top gulch, would save three-fourths of the expense now paid for transportation, and prove a big fortune to its owners, and be the means of making this camp the liveliest in the Southwest.

Already a good wagon road has been built from Beechum's Wells, a point 11 miles from Phoenix, to the mouth of Tully and Humburg creeks.

At present only the higher grades of ore are shipped from this district to the smelters at Benson and other points. With one of the best of climates in the world and with superior water, this district offers advantages second to none other in Arizona, and with capital judiciously expended here this district would soon attract the attention of the entire mining world to its wonderful rich mineral deposits.

The Celebrated Tip Top Mine

Lies in this district, from which over \$2,000,000 worth of ore has been milled, and this mine that lay idle for nearly two years, has within the past eight months been worked by its new owners with great success, and with economical management it bids fair to make very soon its present fortunate owners rich men.

The mother ledge of this district is about two and a half miles west of the old Tip Top mine.

This ledge can be traced for seven miles north and south; it crops out boldly and is located all the way. Some of the most promising mines of central Arizona are being developed on this ledge and the spurs of the same.

Nearly all of these properties are owned by residents of this district whose capital for development has been secured from their mines here.

The first mines at the north end of this ledge are the Chicago and Missing Link, the properties of Messrs. Trotter, Coover & Co. In one shaft, when down 80 feet, ore was struck that averaged assay over \$800 per ton, and a recent shipment realized nearly \$300 to the ton. These mines have now a good body of ore in sight and the owners having capital intend to soon make new developments of this property, having great faith in its future.

The Silver Museum.

The second important developed property on this ledge is the Silver Museum of John Smithline, and the extension of the Silver Museum of Frank Smithline & Co.

The Silver Museum has a tunnel of 150 feet (now in good ore assaying over \$200), a shaft down 150 feet, with hoisting works on the same; at 85 feet there is one level of 76 feet in rich chloride ore, which assayed 280 ozs. silver per ton.

A second level at 135 feet, running in 156 feet, and now in 21 feet of good ore, composed of sulphurets, ruby and chloride silver.

A recent shipment of 10 tons of ore to Pueblo realized over \$400 per ton; another shipment to be made this week, it is expected will exceed \$500 per ton. There are now over 100 tons of ore on the dump, that, by assays carefully made, show it to run \$90 to the ton.

Jno. Smithline, the owner of this mine, four years ago, with difficulty, procured credit for provisions while working on this mine. Overcoming all difficulties he pegged away, and two years ago struck good paying ore, since

which he has taken out over \$50,000, is to-day out of debt and with a good bank account, with a mine only fairly opened, but with prospects of being equal to the old Tip Top in its most prosperous days.

East Extension of Silver Museum

Mine is owned by Frank Smithline & Co. Has a shaft of 80 feet with a 100-foot drift at bottom of shaft, and two 30 foot drifts, all showing good paying ore bodies.

One of the paying ore bodies of the Silver Museum pitches into this mine.

Next south of the Silver Museum are the

Camp Cale and Argus Mines

Owned by Harry Colson. The Camp Cale mine has a 115 foot shaft with a level at 60 feet. In 100 feet; good ore is being struck at 75 feet, which averaged 300 ounces, 25 tons of which have been shipped to Benson.

The Argus mine has a 40 foot shaft, with ledge matter $\frac{3}{4}$ feet wide. A good amount of ore from this mine will average 35 ounces.

The El Dorado Mine

Owned by Ozark Mining Company has three shafts. The first is 93 feet; second, 110 feet; third, 115 feet, with 325 feet of drifts. The shafts No. 2 and No. 3 are being connected by drifts, with the latest improved hoisting works being used. Recent shipments of ore from this mine to Benson run 367 ounces silver.

The ore taken from this mine has paid the entire expense of its development from the beginning to the present time, and netted the company a handsome sum, with a present prospect of soon becoming a much richer and larger body of ore than found yet. One body of ore from this mine assayed upwards of \$1700 to the ton.

Vein is 3 to 12 feet; pay streak 0 to 12 inches. The character of this ore is similar to that in the Tip Top, and the owners of this property are firm in the belief that their mine will prove by future development as good as the old Tip Top.

The Contraband Mine

Lies next, east of the El Dorado, and between it and the Tip Top, and is owned by A. A. Ensign and Chas. Akers; has a 180-foot shaft. The owners intend pushing the development 50 feet farther this year; \$15,000 have been taken out of this mine already, and the owners feel sanguine of soon striking better ore than ever. There are 15 or 20 tons of ore now being prepared for shipment from this mine.

Across the Divide

But still on the mother or crosscut ledge, as some call it, and on Tully creek, is the Great Basin mine, owned by E. J. Cook and George Merwine. This mine has one shaft of 100 feet, and not far from it one of 44 feet. On the latter ore has been struck that assays from 15 to 460 ounces, and 20 tons averaged 110 ounces per ton. Some distance from those two shafts is a third one of 75 feet, with ore of a similar character, but all shafts, being close to the creek, are waiting for new pumps and hoisting work before prosecuting work on this valuable property.

There is no doubt, by the surface indications and developments made already on this mine, that it will prove one of the biggest and best bodies of ore ever found in Yavapai county.

The owners of this property have assurance of Eastern parties taking hold of it, and investing considerable capital for its development.

Next south of the Great Basin mine is the Horu Silver mine of Louis Johnson, who has run a 100-foot tunnel and struck a two to six-inch pay streak of very rich ore; has three tons of ore on the dump, the average assay of which is 250 ounces.

Near this property is the Virginia No. 2, owned by Fred Suhr, Jos. Rodenberg and F. Kuhne. This mine has a 110-foot shaft, a 60-foot tunnel and a 40 foot drift. Several tons of ore from this mine averaged nearly \$1400 per ton. A shipment has recently been made from this mine to Socorro and good returns are expected from the same.

The Marlow mine is three miles south of the Great Basin, and lies at the mouth of Tully creek; has a 50-foot tunnel, and found gold and silver assaying \$45. Commenced a shaft in the bed of a creek and struck a body of ore that runs 80 per cent galena, and 45 ounces silver. The immense exposure of galena is truly wonderful.

The last mine on this ledge is the Pearl, and lies close to the Marlow mine; is owned by Ed. Wiggins & Co.; has a tunnel of 120 feet, a shaft of 100 feet, and one of 110 feet. There is a large body of ore on the dump, and the owners are pushing work on the mine, sanguine of soon coming out to a rich body of ore. A shipment made from this mine milled \$600 to the ton.

I.

Tanned Fish Skin.

EDITORS PRESS:—The report of La Perouse's voyage at page 69, volume 3, of the French edition, giving an account of observations at Castrie's bay, in Asia, says:

"The costume of the women is somewhat different; they wrap themselves in large robes of nankin or skin of salmon, which they tan perfectly, rendering it very supple."

This statement is surprising for the reasons that the skin of the salmon does not seem strong enough to be worth the trouble of tanning, and that no other traveler known to me mentions tanned salmon skin. That the salmon can be skinned is asserted at page 64, for

thers we read the people at Castrie's bay take off the hids with much skill, and then eat it raw as a delicacy.

If the skin of the salmon is of value for tanning, are not the stronger coverings of the sturgeon, the skate, the flounder, the halibut, the shark, the dogfish, the porpoise, the black-fish and the whale more serviceable? It would be interesting to have a report of a series of experiments in tanning the skins of all the large fish of our coast by different processes, with the strength of the product in every case.

While upon this subject of salmon tanning let me call the attention of your readers to a statement by Samuel W. Baker in his "Nils Tributaries" (page 181, Philadelphia edition 1897) that oxides are tanned with milk on the Sudan, so as to be perfectly water proof. Parkyn, in his book on Abyssinia (Vol. 2, page 15) says hides are tanned with clotted milk, flax-seed and flour, but does not speak of the water proof quality. J. G. Wood, in his "Natural History of Man" (Vol. 1, page 20) says that in a few hours the Kallirs tan a skin from the animal, so that it can be used with comfort for a covering, and he briefly describes the process.

JOHN S. HITTLE.

GRAVELLY RANGE.—On the top of the range at the head of Confederates gulch is an extensive bed of gravel, similar in appearance to the old river bed in California that has produced so much gold in the last 20 years. It is supposed that Confederate gulch derived its wealth of gold dust from this source, and efforts have been made to sink to bedrock for the purpose of prospecting the ground, but this has never been accomplished on account of water. But enough has been done to determine the extent and comparative richness of the old river bed. It is from 12 to 15 miles in length, but deep and not easily accessible to water. The shafts that have been sunk never reached a greater depth than 80 feet, where dark blue gravel was encountered prospecting well, but the inflow of water was so great that it was impossible to sink lower. In some instances the water raised to the top of the shaft and overflowed like an artesian well. This water is of a dark muddy color, and emits a strong smell, as if it had been pent up in this old channel for many centuries.

The greater portion of this great placer claim was patented in 1872 and 1873, and nothing of any consequence has been done of late years toward developing it, but it is now stated that a company is to be organized for the purpose of opening up the channel by means of a tunnel. This tunnel is to be 3000 feet long, and will be run through solid slate the entire distance. Mr. Muir, of Mullon tunnel fame, is said to be interested in the enterprise, and if it is prosecuted to a successful conclusion the mine will no doubt prove one of the richest and most extensive in the world.

If this old channel is really the source of all the gold taken from Confederate, it is reasonable to suppose that there must be many millions remaining in the old gravel deposit on the top of the range. We hope the country will be thoroughly prospected, and that it may prove fully as rich as expected.—*Helena Independent.*

NEW GOLD SAVING MACHINE.—A newly invented gold-washing machine is now being used at some of the placers along the Arkansas river, between Granits and Salida, which is said to produce phenomenal success. The machine is described as follows by the *Denver Journal of Commerce*: The machine is composed of three sections, about eight feet in length, overlaying each other at the lower end, 16 inches wide and 10 inches in depth. There are three gratings, one at the head of each section, made of three-eighths inch half-round iron, beveled at almost a point at the top, and with 25 of one-sixteenth inch openings in width, through which the water carries the sand into pockets underneath and following the gratings. There are 12 pockets in each section, with openings or plugs, which allow the withdrawal of any or all of the different pockets. These pockets are of light sheet iron, 15 inches long, placed almost on a level with the bottom of the section, with an opening of an inch or more, and the double flange that creates a rotating current of water, carrying off the surplus sand and leaving the gold within an inside pocket, or at its bottom. The sand is carried by the water to the top of the next grate into the following 12 pockets of the second and third sections. The process is so perfect and the fine gold so surely saved that it is very seldom that they clean up the pockets of the last section. They claim that the first four or five pockets of the first section will save at least 90 per cent of the gold. The cleaning up is done by a miniature machine of the same description, containing six pockets, and without use of quicksilver, it being placed within the flume at any point."

CONSIDERABLE excitement exists over the rich discoveries in the Sabinal mountains, Mexico, 230 miles south of Deming, N. M. Parties are outfitting for these mines daily, and specimens pure silver and ores are being daily brought in. One piece weighing a few hundred pounds and valued at \$3000 has been taken out. Deming being the nearest point to the mines, a stage line will be put on soon.

AN artesian well has been bored in Sierra valley and a good flow of water struck at a depth of 280 feet. Others will now be sunk.

Chrome Mining.

An Important Resource of San Luis Obispo.

A few days since, in company with Mr. Charles Froudo, a reporter of the *San Luis Obispo Tribune*, made a brief excursion to the summit of the Santa Lucia Range, inspecting the deposits and mines of chromic iron, the copper prospects, the possibilities of the soil, and enjoying the beauty and grandeur of the scenery.

The Pick and Shovel Mine.

The prime object was to visit the Pick and Shovel mine. For months we have seen the teams passing the *Tribune* office, hauling many tons of this handsome ore, and we desired to see the locality whence it came. Leaving town by the Cambria road, we branch from it near Chorro creek, and by a well graded road ascend into the Sierra to the terminus at the dump of the mine. Several fine ranches are passed en route, and in the canyons of the mountain are cabins that remind one of the miners' cabins of the Sierra Nevada in early days. These, we presume, are occupied by miners and wood choppers, as we could see no other resources. Some small patches of garden and grain were cultivated, and numerous slight excavations showed where digging had been done for "float" chrome. There appears to be a large quantity of this mineral intermixed with the gravel soil throughout a wide extent of country, and the gathering of it furnishes a precarious livelihood for a number of people. Ascending the mountain to an altitude of about 2000 feet, we came to the Pick and Shovel mine, and there found Mr. William Copland ready to show us through the works. Lighting candles at the entrances to the tunnel, we followed our guide into the mountain side. Mr. Copland discovered this mine seven years ago, and has been working it ever since, taking out several thousand tons of ore.

The present owners are Wm. Copland, Jacob Wilson and John C. Cloud. Several tunnels have been run. We followed the main tunnel in a distance of 600 feet. Numerous branches and chambers have been excavated in the search and taking out of ore, some sinking down below the level, and other rising and winding about above. No regular ledge is found, but the ore appears in branches or small streaks, sometimes of a few hundred pounds, and sometimes in deposits of 40 or 50 tons. In the largest deposit a single blast, a few days before our visit, brought down about 20 tons of high grade ore. The rock of the mountain is serpentine, much broken, easily excavated but rather difficult to support in mining, requiring many and long timbers to brace it up. These timbers are usually of cedar, and quite easily obtained on the mountain near by the mine. The ore is run out on a car, and carried to a convenient dump where it is loaded on wagons for transportation to the railroad depot in San Luis. Ore of 45 per cent and upward assay is taken, the price at the mine being \$6.50 per ton. The teams take about four tons to each load, receiving \$2 per ton for hauling. The freight from the depot to San Francisco is \$4.50 per ton, loading on the cars 20 cents per ton, handling at San Francisco 6 cents per ton, freight to New York nominal, it being desirable ballast, but with insurance, commissions, weighing, hauling, transporting to Philadelphia, etc., with an allowance of 2 per cent shortage, aggregating \$12, making the ultimate cost \$26 per ton. The ore is purchased by the Kelion Chemical Company, of Philadelphia, through the agency of R. E. Jack, Esq., of this city. About 600 tons have been sent during the past year, more than half of which was from the Pick and Shovel mine. The balance of the shipments come from other mines in the vicinity and the collections of prospectors and gambosino work. Employed miners receive \$1 per day and their board. The Sierra Santa Lucia and other mountains of the coast contain an indefinite amount of chromic iron ore. This, although in broken bodies, affords a perpetual mining resource, capable of giving employment to a large number of men, with possible fortunes to some. Some of the deposits have been worked quite extensively and many thousands of tons have been shipped from our port.

The Uses of Chrome.

This great resource appears now but very crudely utilized. The mineral is very useful and by manipulation is increased in valuation many hundred times. Could not reduction or converting works be established here, giving employment to capital and labor and making a business that would add greatly to the prosperity and importance of the place? Its manufactures are varied. The name, chrome, is a Greek word meaning color, and was given it because of its tendency to impart beautiful colors to its compounds. Various combinations make different colors, all brilliant of their kind. With oxygen in different proportions it makes different tints of green. The emerald owes its color to chrome. With tin and alkali it makes the beautiful pink used in coloring porcelain. With lead it makes yellow, with iron, purple, and with magnesia a lighter shade of the same color; with copper a bluish brown; with zinc, a golden brown, and other tints and colors with other combinations. Immense quantities are used by calico printers, in giving and fixing color to their fabrics. Would not the establishing of converting works here lead to the establishing of other manufacturing works here in California. As so little is now realized from so valuable a raw material we

think that enterprise and capital should engage in developing the resource. Chrome is valuable chiefly by its combinations, and the substances with which it is combined for utilization are minerals. Perhaps all of these minerals are in our county or in the State, and the development of one leads to the development of others.

The Santa Lucia

Is rich in other minerals than chrome. We all know of the wealth of quicksilver, copper, salt, lime, sulphur, asphaltum, iron, onyx, silicates, and other substances, all of which will be brought into requisition when such a chemical laboratory is established as chrome converting works. To one looking upon the Santa Lucia from a distance it appears a precipitous mountain ridge covered with a dark chaparral, and uninviting in its neglect. So sharply is it defined against the sky, and so distinctly do all its lines show to the vision that one is deceived in its distance and magnitude. A closer inspection shows the greater part of the chaparral to be a forest of pine, cedar, spruce, and oak of sufficient size for building timber, posts, and fire-wood. Also that the mountain is not so steep but that it can be easily ascended, and that the soil is of a very fertile character. Water flows in many streams from springs near the summit. Our companion in this ascent is a well-known and capable nurseryman, always observant of the soil, its productions and possibilities wherever he goes. He pointed out many places very suitable for orchards, vineyards and gardens, fully as good and with as favorable conditions as lands at Los Gatos, Montecito, and in the Santa Cruz mountains and other localities with which he is familiar, for which \$100 per acre is paid. The soil is a light red loam intermixed with small fragments of rock, and usually of several feet in depth. The dense growth of chaparral, maguey, yucca, and forest trees prove its fertility. The success of those who have planted anything on the mountain side, even in the rocky chaparral, substantiate the evidences of nature. Several of the chrome miners have gardens and small fields high up on the mountain which produce well. These miners, while securing a livelihood gathering chrome, may also clear a plot of ground and, planting it with vines and fruit trees, make for themselves comfortable and self-supporting homes for the future.

A Proposed Tunnel.

The Butte (M. T.) *Miner* says: We were informed yesterday by a prominent business man of this city that a party of miners residing in Butte have under consideration one of the most elaborate mining schemes ever considered in this district. It is as follows: It is a well known fact that between the depot and Walkerville there are several ledges carrying gold, silver and copper. A great many of these ledges have been and are at present being prospected at depths varying from 20 to 800 feet. Although many veins have been discovered in the ground lying between the depot and Walkerville and many of them are being worked to great advantage, yet there are doubtless many more in that space that have not yet been found, and the object of the gentlemen above alluded to is to run a tunnel right up through the city of Butte for the purpose of testing those ledges already discovered at a greater depth than they are at present worked, and to fully determine the number and value of the ledges that are concealed in the bowels of the earth in the country through which the tunnel is to be run. It might be argued against this scheme that all the ground through which it is intended to run the tunnel, is already located and owned by parties, and that a great deal of it is covered by United States patents. This, said, our informant, will not deter us from proceeding with our object, for it is the intention to get all persons owning this ground interested in the matter and have their consent to run through their ground. It is intimated that the proposed tunnel would tap the ledges of the Parrot and other mines in that vicinity several hundred feet deeper than they are at present worked; when the Alice and other Walkerville mines are reached the tunnel will have attained a vertical depth of nearly 2000 feet. Who can estimate the good that would result from an enterprise of this kind? The larger mining companies of this camp would doubtless be glad to do anything in a reasonable manner to assist this scheme. This tunnel would not only test their ledges at a far greater depth than they can possibly hope to attain at the present rate of sinking for several years to come, but with a little judicious crosscutting would tend to drain their mines of water. The cost of running this tunnel is to be met by a stock company, and in return they will ask of the owners of the mines through which they run, the privilege of extracting a certain quantity of ore from their mine, and when the tunnel is in its entire distance, if the mine owners wish to work their mines through it, a royalty will be paid the stockholders of the tunnel for that privilege. It is to be hoped that the persons having this matter under consideration will receive the co-operation of the mining men of this district and all those interested in the advancement of our mining industry.

THE discovery of gold near the boundary line between Alaska and British Columbia has renewed the desire for a fixed boundary. At present miners are in doubt whether they are in British Columbia or in the United States.

Cable Roads in New York.

The New York *Tribune* in a recent editorial strongly opposes a horse road on Fifth avenue, where an attempt is now being made to place one. The *Tribune* thinks "New York has gone trundling along in the old ruts, using horsepower, with all its manifest disadvantages," long enough, and now advocates the cable system which "worked admirably in San Francisco and Chicago." The editor of the *Tribune*, who, while he was spending the summer in this city, frequently expressed admiration for the cable roads in this city, and said that it was a great mistake that it was not adopted on Broadway in New York.

Continuing, the *Tribune* says on this subject: "This related effort to use cable roads is coincident with a most encouraging experience with electric motors in Baltimore. Ten years ago the surface corporations ought to have been alive to the necessity of substituting cables for horses. They are now languidly considering the possibility of doing here what has been successfully accomplished for a long time in Western cities. Ten years hence, when electric motors are in constant use in Baltimore, Boston and Philadelphia, they may be pluming themselves upon the completion of a cable system for New York."

"It must be evident to every thinking man that the horse railway system is inevitably doomed. Possibly cables at first and sooner or later electric motors, with the aid of elevated railways, are to take the place of the present clumsy, inconvenient and demoralizing methods of tramway transit. The entire system of surface roads is in a transition stage, and the coming generation has the assurance of permanent relief from the countless annoyance and discomforts now experienced. What folly, then, it is to talk of putting an old-fashioned horse railway in the finest avenue of the city—the only roadway that remains unobstructed! If Fifth avenue must be surrendered to some greedy corporation whose soul beats time to the jingling music of the bell punch, let there be at least some modern system of surface transit—some method less brutal and barbarous to man and beast than the old-fashioned horse railway."

ORE AT DENVER.—The *Tribune-Republican* says: A great deal of ore is daily arriving in Denver consigned to the Omaha and Grant Smelting Company. Two miles more of railway tracks will soon be put in to facilitate the vast business done at these works. All the furnaces are in active operation, and yet the reserves are constantly increasing. A few days ago a *Tribune-Republican* reporter visited these works, and was surprised to see such an accumulation of ore. Besides thousands of tons in beds and dumps, there were nearly 5000 tons in cars on the various tracks. This company, through its smelting and refining works, handles annually nearly 25 per cent of the silver and lead product of this country. Everything about the works suggest to the visitor, most forcibly, that skillful management and a thorough understanding of all details connected with the business of smelting are possessed by the proprietors and their subordinates. This is the more effective when it is understood that for many months not a pound of Leadville carbonates has been purchased, and hence no dependence has been placed upon the desirable smelting ores of Lake county, but just as favorable combinations have been made and smelting carried on without interruption.

MULE WOOD TRAINS.—The *Truckee Republican* says: Photographs have been taken of the camps and railroad at Incline, showing the huge dumps of wood at the end of the flume, the powerful little engine and the train of woodcars. The strangest picture of them all is that of the mule trains, which convey the wood from the places where it is cut to the flume. Each mule is provided with a sort of saddle or covering, and at about the place where the stirrups should be, hooks project on either side. On these hooks and over the mule's back the four-foot wood is piled, almost hiding the animal from view. Four mules can carry a cord. When the flume is reached the wood is not unloaded piece by piece; the driver simply lifts up the front of the load and the wood slips back over the mule, sometimes falling about his legs and sides so that he is hardly able to crawl out. The patient animals never seem to object, however, and day after day the long trains of mules can be seen winding down the mountain sides, carrying their burden of wood over places that would be inaccessible to wagons.

IN the minds of some, our quartz mill prospects do not look as bright as they did a short time since. If Mr. Brown, of Portland, is not in earnest he should not have said what he did, and our citizens would have carried out their project for getting a mill by popular subscription. The case is not hopeless yet, however, and we expect Mr. Brown still to do all he promised to.—*Oregon Sentinel.*

IT is reported that Senator Fair is endeavoring to gain control of the Consolidated California and Virginia mines, and has been quietly buying up the stock for months past. An election of the corporation will be held next Monday. The present management is bunting for proxies.

SAN FRANCISCO:

Saturday Morning, Oct. 17, 1885.

TABLE OF CONTENTS.

EDITORIALS.—The Davey Safety Engine; Fluxes and Fuel for Smelting; Aspen, Colorado, 257. Passing Events; The Mint Director's Report; Old Mines; Improved Architecture; Nevada Nickel; Tuolumne Mines, 260. A New and Better Gaslight; Centrifugal Pumping Machinery; What is Lawful Mining; Honey-Stone Coral, 261.

ILLUSTRATIONS.—The Davey Safety Vacuum Engine, 257. Webber's Centrifugal Pump; Honey-Stone Coral, 261.

CORRESPONDENCE.—Grass Valley; Humboldt Mining District; Tamed Fish Skin, 258.

MECHANICAL PROGRESS.—Progress in Boiler Construction; Blacksmiths' Hammer Signals; The Practical Mechanic; Treating Steel Ingots, 262.

SCIENTIFIC PROGRESS.—The Porcelain of Saturn; Official Experiment; A New Application; Electric Measuring Apparatus; The Telitopometer; Production of Pure Glycerine; A Poor Storm Glass, 252.

USEFUL INFORMATION.—Laundry Lessons; Invention of the Power Loom; Substitute for Ordinary Floor Coverings; Steel Railway Sleepers; A Shoe Black Plant; A Convenient Pocket Knife; Don't Pool with a Buzz Saw; Prospective Engineering Contracts in England; A New Brake-Shoe; Tempering Copper, 263.

GOOD HEALTH.—Lemons and their Use; The Tooth Evil; Infectious Diseases; Plith and Longevity, 263.

MISCELLANEOUS.—Chrome Mining; A Proposed Tunnel, 259. What Railway Trains Can be Run For; The Smoky Region, 263.

MINING SUMMARY.—From the various counties of California, Nevada, Arizona, Montana, New Mexico, Oregon, and Utah, 264-65.

MINING STOCK MARKET.—Sales at the San Francisco Stock Board, Notices of Meetings, Assessments, Dividends, and Bullion Shipments, 268.

Business Announcements.

Perforated Metals—Fraser & Chalmers, Chicago.
Mica Mine—G. W. Spaworth, Lang Station, Cal.
Mining Engineer—Robert F. Letts, S. F.

See Advertising Columns.

Passing Events.

This week we have had the first rain of the season. It was not very heavy, it is true, but enough to signify that our rainy season has commenced. A good many miners are anxious for the streams and ditches to get full again so that mills can work once more.

Down about Hawthorne, in southeast Nevada, they are having quite a little mining boom, and a good many men in that region are hopeful of making a rich strike.

Attention is again being drawn to the beach mines of Northern California and Southern Oregon. Some claims have lately changed hands at good prices. Another one process has come to the front, and this is one reason of the revival. There are large tracts of this auriferous sand, extending several miles inland, which can all be worked if means for doing so economically are provided.

Northern California counties continue to attract considerable attention from mining men. Some of the mines up that way are doing very well, and there are many prospectors in the hills looking for others.

It is said that \$100,000 has been refused for the Stonewall mine, in Julian district, San Diego. The editor of this paper, who worked in a claim near the mine in 1871, remembers when a good deal smaller figure would have taken it. The mine paid well on the surface, but when a little depth was attained the character of ore changed and the mine was given up. It laid idle a long time, but is again being worked.

The Mint Director's Report.

The annual report of the Director of the mint upon the production of the precious metals in the United States during the calendar year 1884 has just been issued from the Government printing office. Among other things, the Director has traced the bullion known to have been converted into coin or manufactured into bars and exported, or used in the arts, back to the district or mining region from which it was derived. This work necessitated the accumulation of statistics as full as possible of the treatment, movement and final disposition of the bullion from its extraction from the earth in the form of ore or native metal, to its delivery to the Government for coinage, or to private parties for export or other use. These statistics are supplemented with direct information as to the actual yield of the more important mines, and with reports from correspondents and mint officers with regard to the condition and progress of mining for gold and silver in the principal localities of the United States. The States and Territories are considered by counties and districts, and much useful information has been compiled.

In addition to the descriptive matter and the statistics there are several miscellaneous articles: "Gold and Silver Mining in California, Past, Present and Prospective," by Walter A. Skidmore; "Practical Hydraulics as Applied to the Measurement of Water in Motion, to Mining and other industries," by P. M. Randall; "The Various Forms in which Gold Occurs," by Wm. P. Blake; "The Separation of Silver and Gold from Black Copper at Oke," by T. Egleston.

In this connection it may be well to call attention to the fact that Mint Director Eureka has been severely criticised by a portion of the press of this State for statements never made by him at all. The miscellaneous articles are contributions which have the names of their authors appended. Instead of crediting the authors with the statements, they have been credited to Mr. Burchard himself. Quotations have been made from these articles, as the opinions of a Government official, when they are simply the statements of individuals who have contributed to the report and whose names appear. We shall, from time to time, make extracts of interest from the report.

Old Mines.

Those who have had occasion of late to travel through the old mining sections of this State have observed one notable feature of great promise. That is the reopening of many old claims and mines that were abandoned twenty years or so ago. In those days ore had to be rich to pay; transportation, lumber, provisions, tools and everything else was high. We ran our mines on a high pressure system. The managers were paid large sums for little work, and the "top heavy" plan was almost universal. It remained for practical miners to show that this basis was a false one. Force of circumstances compelled them to take up old claims again, and they found that with proper management, under the new condition of affairs, money could be made. People do not look for 25 per cent these days. They do not all expect a big fortune out of a small mine. If they can make a good living and lay something by they are satisfied. They can get along with fewer officials and less extravagance and can make money.

Instances may be cited in every county in the State where old mines, properly worked, have been made to pay, where fortunes were sunk in them in days gone by. Gold mines pay with depth. Some of the deepest gold mines in this State are the best paying ones to-day. People who quit work at a couple of hundred feet left claims that are now valuable. As time goes on more and more of these old mines will start up again, giving employment and profit to both labor and capital. We know much more about quartz mining than we did twenty years ago, though we thought we "knew it all" then. Ore is being worked very cheaply in these days, and the percentage of precious metal saved is much higher than formerly. California is to-day the best gold mining field in the world, notwithstanding our hydraulic mines are closed down.

A MANUFACTURING company of Pittsburg has placed \$2,000,000 worth of brakes on 43,000 Western cars in 18 months.

Improved Architecture.

No one can have failed to notice that within the past few years a very great improvement has been manifested in the character of the buildings erected in various parts of this State. In the pioneer days buildings were erected for shelter merely, and then as civilization progressed a better class of structures appeared, having more or less architectural pretensions. But what were considered fine buildings in this city ten years ago are now looked upon as third or fourth-class structures. Those put up of late are of brick, stone and iron, with splendid solid foundations, concrete floors, iron girders, substantial sidewalks, and costly modern improvements. The system of lighting, ventilation and sewerage are all improved. The dwelling houses now built are far superior to the old style. Glass enters largely into the structure. Abundant light and sun are secured, and the houses are healthier and pleasanter. For cities like Oakland, San Rafael, San Jose and Sacramento, the dwelling houses now being put up are of elegant design, and of architectural beauty. The old square box, with its few narrow windows, is a thing of the past. It is not only the mansions of the rich that show improvement in these directions, but the more modest cottages as well.

In the suburban towns the small cottages predominate. But all the new ones are of good appearance, and some money is spent in ornamentation and decoration. It gives our towns a more permanent air. People are making their homes there. They have come to stay. They are surrounding themselves with the luxuries of civilization and the nomadic character of the population is fast disappearing.

Throughout the country regions this improvement is also manifest. In Southern California this is particularly noticeable. Many Eastern people have come in and the sheepherder's hut, or cattleman's shanty have given place to the more pretentious residence of the permanent farmer or the orchardist. The newer towns, such as the colonies show, are far more beautiful than those of older date. The surroundings are more artistic and more comfortable. The houses look like homes. The people are growing up with the country, and have no idea of moving away as soon as they make a little money. One will now find elegant residences more like the country houses of the East and England as he travels through the State in these days. All the thickly populated valleys are settling up with a class of people whose tastes and habits call for homes of a more pretentious character than those the old Californians have been in the habit of seeing.

With this improvement in exterior comes also a decided change in interior fittings. The plain, glaring white walls, with no tinge of color or ornamentation are things of the past. Ornamental papers, tints and frescoes have covered their ugliness. The wood-work is beautified and more ornate than formerly. The furnishings are more elaborate and artistic. The old grave-like parlor, dark and dreary, with its marble center-table, and stiffly-placed chairs, is a thing of the past. The fire-places and mantel-pieces are both ornamental and useful. The hangings take off the squareness of construction. Portieres displace the great unhandy doors and give an air of comfort to the interior, which is most pleasing. Decorations of household appliances are common everywhere, and the homes in every way improved in appearances and comfort.

These things are indicative of domestic improvement in all directions. Men and women are making homes for themselves, and the community is growing. Artistic taste is developed among the members of the household, and the stranger among us can no longer wonder at the primitive way we have been living. California is showing her progress as a State in the character of the buildings which are now dotting her soil on every hand.

IN THE new found cave near Murphy's Camp a natural shaft has been discovered. It has been sounded to a depth of 160 feet without sounding bottom. It is supposed that a much larger cave exists beneath the one now discovered and that the shaft leads to it.

It is stated that six black sand claims near Randolph, Oregon, were recently sold for \$540,000. It will take lots of that fine gold to make up that sum.

Nevada Nickel.

Nickel is not an abundant material on this coast, though its ores have a more general geographical distribution than is generally supposed. They occur in moderate quantity, in close association with chrome ores, in the serpentine rocks from Canada to Maryland, and also with the chrome ores of the Pacific Coast, notably in Oregon. Nickel occurs in this State, Oregon, Nevada, and New Mexico, but no active mining for it has been done. The nickel ore in Kern county, in this State, never amounted to much. That found at Piney mountain, Douglas county, Oregon, was discovered in 1881, and created quite a stir for a time. It contained about 23 per cent of nickel oxide, and it was supposed the mine would be opened and worked. The owner demanded a large price for the mine, and, we believe, went to England to dispose of the property, failing to do so here. At all events the mine has not been worked.

A nickel mine found in 1880 in Churchill county, Nevada, has been worked since, but mainly in order to develop it and see what it really contained. Several other mines were said to have been found, but only the one owned by Charles and William Bell and John Mason, has proved of value. This mine has been worked by the Nevada Nickel Co. We see now, by the Reno Gazette, that the mine has been sold to Eastern capitalists, who intend to erect furnaces and fully develop the mine. The owners have proved the existence of a large body of ore assaying from four to as high, in some instances, as 60 per cent in metallic nickel. The ore at times carries a considerable percentage of cobalt. The ore has also proved to be very easily worked, Mr. Bell producing small bars of nickel in an ordinary crucible with a small furnace without a blast. The fact that the principal nickel mine in the United States, situated at Lancaster Gap, Pa., produces ore containing but 1 1/2 per cent of nickel, points to the Nevada mines as one of the main sources of future supply of this valuable metal. It appears that the ores of the other mines of the world all carry a much lower percentage of nickel than these, and are all more or less rebellious. The terms of the sale have not been made public, but the price paid is said to be a very handsome one.

Tuolumne Mines.

We had a conversation this week with B. G. Davies, who has been for some months engaged on a mine about six miles from Sonora, and three from Columbia. The owner has been, like others in that region, compelled to shut down for lack of water. The water has given out this season about two months before the usual time, as there is no snow in the mountains.

The Tuolumne ditch whence the supply of water is obtained, takes the water from the south fork of the Tuolumne. It is 42 miles long and is a very old one, having been originally built in 1852. It is now utilized by both miners and farmers. It furnishes water to the mills for five cents an inch for 12 hours. As the water is so low many of the mills have had to stop, and will not be able to resume work until November or December.

Mr. Davies considers that there are many good mines in Tuolumne, but most of them are held at very high figures. He has been in many gold mining regions on this coast and in Australia, but never before saw a region where the veins are so spotted. The gold is either in chutes, pockets or chimneys.

In some cases this is a decided advantage, though it has doubtless kept capitalists from investing largely. An instance of it's advantage, cited by Mr. Davies, is that of the Arnold mine, a few miles from Columbia. At one time the owner was down to "bedrock" financially. In a despondent mood one day, wandering over the hills he stumbled and fell. On turning back to see what he had tripped on he found some quartz croppings, and next day pounded out \$500 from the rock. He sank 25 feet and took \$8000 from a pocket. The mine has made him independent. He has no mill, but uses a spring-pole and mortar to crush the rock. The mine is superficial, but rich, and there are other mines of similar character.

It is about 35 or 40 miles from Milto, the terminus of the railroad, to Sonora, and the road is rough, so capitalists do not seem to care to go into the section referred to for investment.

A New and Better Gaslight.

An effort was made last year to organize a new gaslight company in this city to introduce the new process under the patents owned by the United States Equitable Gas Company, of New York. As the new company which had in the course of construction very extensive gas works in New York, were delayed somewhat in getting their works in operation, it was feared that the new process might be a failure, consequently the time expired for which the patents were bonded, and the parties here lost control.

The new company in New York has been in successful operation for over six months, and the success of the system has been far beyond the expectations of the promoters of the new company, the patronage of which has been unprecedented, and it comes entirely upon merit; the pure and brilliant gas giving the greatest satisfaction to the already large and increasing number of consumers.

Now, a few words as to the origin of the new process. The pressure of the varied forms of electrical light has for some time past urged scientists to look for a superior illuminating gas not containing the impurities known to exist in all gas heretofore manufactured by any of the, so-called, water gas processes, and of much higher candle power. The late Tessie du Motay, aided by his former pupil, Barou Jerzmanowski, discovered that essentially pure hydrogen could be produced by passing a current of steam and liquid carbon through a body of quick-lime. This is then carbureted in the usual way, and gas produced very rapidly and at low cost. It does not contain any carbonic acid, and not exceeding 5 per cent of carbonic oxide; can be brought to any desired candle power, always giving a perfectly white and brilliant light.

The following is the official test of the Gas Inspector of New York City, one burner consuming five feet per hour at one inch pressure:

Equitable gas	29	candle power
Low gas	22	"
Coal gas	18	"

Eighteen patents cover the processes by which this gas is manufactured, which are owned by the United States Equitable Gas Company.

These patents have been secured by a syndicate in this city, and steps are being taken to introduce the new process in San Francisco, so that from present indications our citizens will soon be furnished with this excellent and brilliant light which has become so popular in New York. A company has been organized, and the Equitable gas is soon to be introduced also in Chicago.

As an evidence of the cheapness as well as good quality of the new gas, the company in New York is forbidden by its charter from charging more than \$1.75 for 1000 feet. The charter also compels the company to supply gas to all public buildings for \$1.50 per 1000 feet and to all street lamps at the rate of \$12 each instead of \$17, as charged by the other companies, being also bound to furnish gas not less than twenty-five candle power.

At Coeur d'Alene there is a water ditch nearing completion, which will supply the claims on Trail, Potosi and American gulches, many of which contain rich deposits of gold, but it is now so late in the season that claim holders will do but little mining until next spring. The miners there consider there is no question in regard to there being an abundance of gold in the Coeur d'Alene mines, and now that men who own the mines have facilities for extracting it, it is expected that next summer will show large and lively camps on Pritchard creek and Trail, Potosi and American gulches.

THE COL. SELLERS MINING CO., at Leadville, Colorado, having used a couple of Triumph Concentrating tables for sometime successfully, are now putting in two more of the same kind. The machinery of the Joshua Hendy Co. is deservedly popular in Colorado, and their representative there is also popular.

CHARLES DURNING, for nine years in charge of the Manhattan mill, at Austin, and a very old resident of Nevada, has been selected to take charge of the milling of the ore at Belleville.

THE owners of the Lapanta, Nev., are consulting together as to the best place for erecting a new mill to work Lake District rock.

Centrifugal Pumping Machinery.

Our illustrations on this page represent two of Webber's centrifugal pumps, manufactured by the Lawrence Machine Shop, Lawrence, Massachusetts. When centrifugal pumps were introduced, they met with every form of opposition. They had to contend against prejudices on all sides, and ridicule and abuse were often showered upon them. Very few engineers then would adopt or use centrifugal pumps, and the public were afraid to do so, taking it for granted that what engineers, mechanics and scientific men said must be true. Even engineers who were constructing centrifugal pumps declared them unsuitable for anything but the lowest lifts, and limited their application to one or two uses. The progress made in their introduction was therefore very small; but perseverance, aided by careful and accurate experiments, has proved their value and efficiency.

The Lawrence Machine Shop builds several different varieties of these pumps, they being especially constructed for the high to lift and

FIG. 1.

WEBBER'S CENTRIFUGAL PUMPS.

the work to be done. It is absurd to think that the same pump will do equally good work on high and low lifts.

Some makers, to save themselves trouble and expense, make one class of pumps do all sorts of work, and pride themselves on the fact. The result can only be loss to the purchaser; buyers of such are naturally disappointed with them; get disgusted, and abandon the use of centri-

The accompanying engravings show material about which there is quite a general misapprehension among those who have given little attention to matters of natural science. Many readers will recognize in the engravings what they have usually called "petrified honey-comb." The misapprehension is so widespread that Prof. Cook has introduced a true statement about the curious material in his "Bee-keeper's Manual," from which we take the engravings. These specimens are fossil coral, which the paleontologist places in the genus Favosites; favosus being a common species in Michigan. They are very abundant in the lime rock in Northern Michigan, and are very properly denominated honey-stone coral. The animals of which these were once the skeletons, so to speak, are not insects at all, though often called so by men of considerable information. They are really coral polyps. The species of the genus Favosites first appeared in the Upper Silurian rocks, culminated in the Devonian, and disap-

FIG. 2.

peared in the early Carboniferous. No insects appeared till the Devonian age, and no Hymenoptera—bees, wasps, etc.—till after the Carboniferous. So the old-time Favosites reared its limestone columns and helped to build islands and continents untold ages—millions upon millions of years—before any flower bloomed, or any bee sipped the precious nectar. In some specimens of this honey-stone coral (Fig. 2)

FIG. 2.

HONEY-STONE CORAL.

fugal pumping machinery, thinking that all sorts of centrifugal pumping machinery are alike.

Fig. No. 1 represents the class "A" pump, which is used exclusively for pumping to heights above 35 feet. Fig. No. 2 represents the class "C" pump, which is used for drainage and irrigating purposes, or for lifts to 15 feet in height.

There is still another style manufactured, class "B," which is used for lifts from 15 to 35 feet. These pumps are coming into very rapid use on this coast for irrigating and drainage purposes. The Webber pump has proved itself to be of the highest economical efficiency, and as far as its details go, it is the extreme of simplicity. Any further information desired regarding the Webber pump will be furnished by Messrs. H. P. Gregory & Co., Pacific Coast agents.

CONSOLIDATED CALIFORNIA AND VIRGINIA.—At the annual meeting this week there were 181,691 shares represented. There was no contest in the election and the old management was retained, 169,402 shares of stock being voted in their behalf. The following officers were elected: President, Charles H. Fish; Vice-President, R. H. Pollis; Trustees, A. B. Hull, Cornelius O'Connor, George Frier; Secretary, A. W. Havens.

Honey-Stone Coral.

What is Lawful Mining?

The solution of the debris question will, in a great measure, depend upon the report of U. S. Circuit Court Commissioner Houghton, and the subsequent action thereon by Judge Sawyer in the matter of the so-called North Bloomfield contempt case. We have heretofore refrained from commenting on the matter at issue, as we think it improper for a newspaper to pre-judge a case on trial where the testimony was taken in secret session, and we now allude to it only because we are informed that the Commissioner will make his report about the time we go to press. Though the testimony was taken in private, enough has leaked out through the correspondents of interior papers to enable us to present the status of the case. The complainants—the Anti-debris Association—allege that the Bloomfield company on one or more occasions violated the injunction by piping against their hydraulic bank. The defendant company allege that they were engaged in prospecting their ground to ascertain whether it would pay to work by the drifting or any other method hitherto considered lawful, and in so doing they used no more water than was necessary to clear the mouth of their tunnel, when the bank caved—as it did on one occasion—and that they had not pursued hydraulic mining in any sense.

As to the merits of the case, we can pronounce no opinion until the Commissioner renders his report, but we hope the report will be sufficiently comprehensive to enable Judge Sawyer to define explicitly what is lawful mining, for his decree in the case of the Woodruff vs. N. Bloomfield leaves a doubt whether any mining which soils water is lawful. Our auriferous territory is very extensive, and in many localities favored with an abundance of water gravel may be washed by the elevator process, often described in our columns, and the debris retained in the old pits, where the water will settle to nearly a pure condition. Should this process not fall under the ban of the Woodruff decree many mines now either enjoined or in terror of interference may be worked. We shall await Judge Sawyer's decision with interest.

Caves and Ore Bodies.

Caves are found in many places in limestone regions, and are of frequent occurrence in connection with ore bodies; in fact, in Eureka District, Nev., Mr. J. S. Curtis, of the U. S. Geological Survey, states in his monograph on the "Silver Lead Deposits of Eureka," that no large ore bodies have ever been found there which had no caves over them; but caves are, by no means, always accompanied by ore bodies. They resemble all caves found in limestone, and have been produced in part, at any rate, by the solvent action of water carrying carbonic acid.

These waters passed through fissures and cracks, enlarging them, and dissolved the limestone, especially where it was crushed and broken. The finely crushed limestone was dissolved first, and the large fragments and boulders settled down, and were finally either completely dissolved or remained in the bottom of the caves. This action was naturally most considerable at those points where the best opportunity was afforded for the free circulation of the water, and as the limestone was not uniformly shattered, and as the different varieties of rock did not offer equal resistance, the openings formed were of very irregular character. The roof and sides of the caves are sometimes entirely bare, and only show the characteristic surface which results from the action of a solvent. Deposition of calcium carbonate however, as well as its solution, has taken place on a large scale, and is still going on. The roof and sides of most of these caves are covered by aragonite crystals, and in some of them crystals of this mineral are still forming.

ACTING under imperative orders from President Diaz, the Governor who dispossessed the American miners from Las Cruces silver mines, has been compelled to surrender the mines to their American owners. This is done through the intervention of Secretary Bayard.

SOME Salt Lake men are at Neibart with a view to arranging for moving a smelter, now situated at Salt Lake, to the new Meagher county camp,

there are to be seen banks of cells, much resembling the paper cells of some of our wasps. This might be called wasp-stone coral, except that both styles were wrought by the self-same animals.

A CORRESPONDENT of the Coos Bay, Or., News writes from Bandon City, on the Coquille, as follows: Some time ago we let our black sand beach mines to a couple of Chinamen for \$25. They took out \$1500. According to the new process they would take out \$45,000. From every quarter we learn that the new process is a decided success, and we see no reason whatsoever to doubt it.

THE black sand mines on the coast of Southern Oregon are attracting much attention at present. Some more "new processes" have been discovered for separating the gold from the sand. Everybody knows that the sand has "millions in it," if it can only be got out.

AMERICA, the chief silver-producing country of the world, has to telegraph to England (which produces no silver) every morning to learn the market price of the metal.

SAMUEL I. SILVERMAN, of Helena, M. T., has perfected all necessary arrangements for providing that town with additional sampling works.

MECHANICAL PROGRESS.

Progress in Boiler Construction.

At the meeting of the Master Mechanics' Association in June, a very interesting report was read on "Progress in Boiler Construction," from which we extract as follows:

Steel was reluctantly used in 1869, but 200 boilers of steel are reported in 1875, and it was recommended in that year, exclusively recommended in 1877, and the committee was unanimous in 1878. In 1870 an opinion from a French engineer was quoted, being steel plate for boiler use should be capable of hardening; presumably he was using the metal in barrel plates, and to reduce their thickness and weight, required a metal of high tensile, which he would secure in a steel that tempered by immersion; but in 1871 the complaint was that it was manufactured too hard, and in 1875 steel that would not harden was recommended, more especially for fire-box services. The steel we now easily procure and should use for both sheets and furnace, has but a small percentage of carbon—say from 0.15 to 0.20 per cent, and therefore, if fairly free from silicon, phosphorus, etc., will not harden. It is mild and ductile, working under the hammer, even when cold, most freely; has a breaking resistance of from 62,000 to 65,000 lbs. per square inch of section, with an extension of 24 to 25 per cent in a length of ten inches. A good shop test—in addition to bending over at a point in test piece where it has been punched either cold or after it has been heated and dipped in water—is to take a narrow strip through which a hole one-fifth its width is punched and then enlarge the hole with a drift and flagging hammer to fully three times its original punched diameter without splitting the strip.

It may be said that there is now no practical limit to the size that steel sheets of desirable quality and thickness can be procured. The Central Pacific are making the straight portion of wagon-top boilers in one plate, and receive sheets 14 feet 3 inches by 8 feet by 7-16 inches, and last year, at Erie, Pa., 3-inch plates 16 feet long were bent cold in rolls to a curve of 30 inches radius, so that the two sheets made one boiler 16 feet long and 60 inches diameter, with but two longitudinal joints in barrel. Mr. Webb has rolled from ingot and used 7-16-inch steel plate 11 feet 3 inches wide by 12 feet 9 inches long in one barrel ring. This practice is in line with the strong recommendation of the committee in 1871; but, as they point out, it requires special rolls to be built for bending the plate. Welded seams, when iron plate and coke fire are used, give at least but an ultimate tension of 14 long tons and 6½ per cent extension for 22-ton iron, therefore it is not a matter of surprise that such a form of joint was seldom used; but now 22-ton mild steel and common gas flame for beating the scarf secures a weld having an ultimate tension of 21 tons and an elongation of 8½ per cent in a 10 inch length—that is, an increase of 50 per cent in strength and 30 per cent in ductility, although it should be noted that this excellent result is but one-third the ductility of the unwelded steel plate.

Some careful experiments show that very mild steel, after annealing, loses somewhat in resistance to ultimate tension, and in ultimate percentage of extension; or, in other words, annealing does not necessarily improve the natural plate. Nevertheless, if holes are punched in the plate, or it has been flanged or set when warm, mild steel must be annealed, the annealing furnace temperature not being carried too high—a blood or cherry red is quite sufficient—the time in furnace not prolonged beyond the point that will secure thorough and equal temperature, and the cooling not too much hurried by contact with damp earth or a current of wind at low temperature. Neither should there be any attempt to "soften off" by cooling in a bed of sawdust or ashes.

If the flanging, setting or any other distortion, such as bending in the rolls, can be done cold, there is no necessity for annealing either plates or bars, but all such setting is preferably done under the steady pressure of hydraulic tools.

In the course of the discussion on this paper, the use of steel was freely endorsed for boilers and fire-boxes, but not for rivets. Preference was given to drilling out holes rather than punching, as a general rule, but with a very ductile metal punching might be allowable. One member, however, declared that notwithstanding what was said 99 per cent of the members would continue the practice of punching, on account of the less expense.

The objection to the use of steel rivets was mainly due to the obscure matter of galvanic action and its influence on corrosion. Were it not for that uncertainty steel rivets would be preferred. Machine-riveting by a single square was not approved of, but the steam piston riveter giving several strokes was. The hydraulic piston was approved of, which has the merits of the single close squeeze, and the adjustability of the steam piston, producing work of unequalled solidity, and dispensing with the necessity for calking, as boilers are now turned out tight under test pressures of 160 pounds. A large amount of boiler patching, and almost the whole of the work on new tender tanks in position can be done by the portable hydraulic tool.

In calking one source of danger in boiler manufacture is excessive joint calking (both inside and out) with a sharp-nosed tool so close to inner edge of plate as to indent and in many

cases actually cut through the skin of the lower plate. The old style of calking that put a positive strain upon rivets, thus commencing distortion and putting excessive stress upon rivets (already in high tension) before the boiler commenced work, is becoming a thing of the past. With a proper proportion of diameter and pitch of rivet to suit steel, all that is required is the use of a light fuller which does not force the joint. There is but little need for calking if means are taken to secure a clean metal-to-metal face at the joint. A clean metallic joint can be secured by passing over the two surfaces waste wet with a weak solution of sal-ammoniac and hot water, an operation certainly cheap enough, both as to materials and labor required.

The result of such practice is that the riveted joint can be allowed a wider margin beyond outer edge of rivet, permitting the rivets themselves to have the larger diameter, which mild steel absolutely required; and the rivets can be pitched correspondingly farther apart, as the pitch has often heretofore been controlled more by the resistance required to meet the heavy use of the old calking tool than settled by an investigation into the best proportion to secure the utmost strength for given thicknesses of the good material that is now almost exclusively used in locomotive boilers.

Blacksmiths' Hammer Signals.

When the blacksmith gives the anvil quick, light blows, it is a signal to the helper to use the sledge, or to strike quicker.

The force of the blow given by the blacksmith's hammer indicates the force of blow it is required to give with the sledge.

The blacksmith's helper is supposed to strike the work in the middle of the width of the anvil, and when this requires to be varied, the blacksmith indicates where the sledge-blows are to fall by touching the required spot with his hand-hammer.

If the sledge is required to have a lateral motion while descending, the blacksmith indicates the same to the helper by delivering hand-hammer blows in which the hand-hammer moves in the direction required for the sledge to move.

If the blacksmith delivers a heavy blow upon the work and an intermediate light blow on the anvil, it denotes that heavy sledge blows are required.

If there are two or more helpers the blacksmith strikes a blow between each helper's sledge-hammer blow, the object being to merely denote where the sledge blows are to fall.

When the blacksmith desires the sledge blows to cease he lets the hand-hammer head fall upon the anvil and continue its rebound upon the same until it ceases.

Thus the movement of the hand-hammer constitute signals to the helper, and what appear to be desultory blows to the common observer constitute the method of communication between the blacksmith and his helper.—*Blacksmith and Wheelwright.*

THE PRACTICAL MECHANIC.—A correspondent of the *Scientific American* writes to that journal as follows: In one of the most prominent establishments for the manufacture of machinery, machine tools and hand tools in the country the apprentices are subject to novitiates atest of their capabilities and their leaning in the different departments of work in the vast establishment. After a judicious trial of the cleaning of castings, the rough vise work, planing, turning at the lathe, and possibly boring, the apprentice takes a hand at pattern making as a helper, then he goes to the draughting-room, if he inclines that way. He graduates, finally, to his proper "posib," and is draughtsman, pattern maker, forger, molder, floor finisher, lathe man, planer man or fine vise worker. With such a four years' chances the apprentice will come out a competent mechanic—if there is any competency in him. After all, the old time job shop was about as reasonable a school as the embryo mechanic could desire. The superintendent of one of the best known establishments in the country recently died. In conversation some time ago he stated that his intimate knowledge of the different departments of the work was got from his experience in a "job shop," where he had a chance at everything, from building a steam engine to repairing a hoisting winch; he worked at the vise, the lathe, the planer, sometimes at the forge, and always tempered his tools. He made his own drawings (sketches), and frequently made his own patterns. The amateur accomplishments must have been crude, but they gave him the idea of how a job should be done, as well as what was to be accomplished. He was an example of one sort of a practical mechanic, of which there should be more.

TREATING STEEL INGOTS.—J. Giers, of Middlesboro', England, has procured a patent for a new method of treating steel ingots. The ingots are placed in pits or cells built in a mass of brickwork, which, acting as a heat absorber, receives and radiates heat back to the ingots. A comparatively small gas flue passes over the pits without impinging upon them. The flue radiates a part of the heat to the top of the ingot, and keeps the brickwork hot at the point where it is most likely to lose heat. The gas is only kept burning when necessary—that is, when the ingot tops are deficient in heat—or it may be kept burning when there is any cessation of work or when preparing the pits for work.

SCIENTIFIC PROGRESS.

The Perihelion of Saturn.

Nearly a whole generation will pass away, says the *Call*, before the planet Saturn will again be seen under conditions as favorable as he presents to the astronomers this month. He reaches perihelion or his nearest point to the sun on the 21st inst. at 7 A. M. It is twenty-nine and a half years since the sun and the planet which is second in size to him approached so near to each other. Meantime Saturn has traveled more than five thousand million miles in making his vast circuit around the sun, and now looks the great luminary in the face from a standpoint 100,000,000 miles nearer than when 15 years ago he passed apellion, or his most distant point from the sun. The approaching perihelion of Saturn is an important astronomical event, and has been anticipated for years with eager interest. It will be a field day with astronomers, who will eagerly improve the rare occasion in searching for new satellites, in seeking to find out what Saturn's rings are made of and in tracing the shadowy belts on the planet's disk. When in perihelion Saturn's rings are open to their widest extent. Instead of being dull and murky, he shines with a soft and serene light. The planet rises in the northeast shortly after 9 o'clock, and will rise about four minutes earlier every evening until the end of the month, when his beaming face will be visible soon after 8 o'clock. When it is remembered that a generation of men lives and dies in one Saturnian year, our earth with her one moon appears all the more insignificant in comparison with this magnificent Saturn, with his rings, moons and belts. We may, however, find consolation for our littleness in the thought that the earth is in her perfection of development, while the primeval fires of Saturn still burn. When animate life reigns on Saturn, the earth, according to the law of decay, will be a dead world, cooled down to the condition of the moon, where life and moisture are unknown. But millions of years will be required to effect these changes.

Venus is an evening star this month, and easily wins the second place in the October list of planetary notables. She grows more beautiful all the time as she recedes from the sun, her increasing distance being now plainly perceptible in the longer time she remains above the horizon after her departure. When the month closes she will set two hours and a quarter after sunset. Venus is in aphelion on the 16th inst. at 10 o'clock in the evening.

Mars is an evening star and varies little in his time of rising during the month, which is about half an hour after midnight. He may be found at the close of the month a little way northeast of Regulus, and is visible as a small red star.

Jupiter is a morning star. He is too near the sun to be of much consequence at present, but is making his way rapidly to visibility, and when the month closes he will rise more than three hours before the sun. He is in conjunction with Beta Virginis on the 21st inst. at 2 o'clock in the afternoon.

Neptune is a morning star. He rose on the 1st at 7:30 o'clock in the evening. On the 31st he will rise about 5:30 o'clock.

The October moon falls on the 23d, at 4h. 22m. P. M. There was a very close conjunction, or an appulse, between the moon and Uranus on the 7th, at 6h. 56m. A. M., the moon being only 6' north of the planet. She was in conjunction with Venus on the 11th. On the 25th, at 8h. 58m. A. M., she is at the nearest point to Neptune. She is in conjunction with Saturn a second time on the 28th, and with Mars on the 31st.

The above calculations are based on Washington time.

OPTICAL EXPERIMENT.—A contributor to *Cosmos* suggests a curious optical experiment which may serve to show the principles of the stereoscope. If we cut out of black paper two similar figures—two crosses, for example—and place them, their extremities almost touching, at about three inches from the eyes, before a sheet of white paper, we shall see three crosses, the middle one being dark and completely separate. This phenomenon is explained by the simultaneous vision of the two eyes, and it is easy to show this by looking at the objects successively with one eye. The experiment becomes still more interesting when, instead of black figures, we employ complementary colors—red and green, for example. In this case we must use a dark background, and there will appear a white cross in the middle.

A NEW APPLICATION.—An exchange says that a new application of the incandescent light is reported from Germany, where it is said the light has been applied to the internal illumination of the telescope by a committee of the German army. The lamp is placed in a recess normal to the main lunette of the telescope, and between the eye and cross wires. The light of the lamp passes through a small hole in the wall of the lunette, and illuminates the cross wires. This illuminating of the wires is found to double the distance that the telescope will measure.

ELECTRIC MEASURING APPARATUS.—A correspondent of *Science* writes as follows to that journal: In the *American Journal of Science* for March, Professor Trowbridge describes a form of differential cosine galvanometer, in which the

action on a magnet of a strong current, moving through the fixed vertical circle of a large tangent galvanometer (of one meter radius), is balanced by the opposite effect of a weak current from a Daniell cell moving in a reverse direction through the coil of a cosine galvanometer, the fixed and movable coils having a common center. By moving the coil of the cosine galvanometer about its horizontal axis, it is easy to secure a balance, and thus to determine the magnitude of the strong current. An obvious and simple modification of this apparatus consists in substituting for the cosine galvanometer an ordinary tangent galvanometer, with a coil of small radius having a number of turns of wire in circuit with a battery and rheostat. By varying the resistance in the circuit, a balance can be reached, and the strength of the current found. A mirror galvanometer thus arranged, and in direct circuit with a battery and very high resistance, or in derived circuit with a battery and tangent galvanometer, might sometimes be useful, as in studying slow variations in strong currents. Another instrument, which is likely to prove valuable for measuring strong currents, is a new form of differential cosine galvanometer, recently devised by Mr. R. H. Pierce, while a student at the Massachusetts institute of technology. The current is caused to pass in opposite directions through two concentric circles of nearly the same radius, as in Brackets' differential galvanometer; but the inner of these is capable of moving upon a horizontal axis, as in the ordinary cosine galvanometer, and it is revolved until a convenient deflection is secured. A simple formula then gives the strength of the current.

THE TELETOPOMETER.—A considerable amount of time and much thought have been bestowed upon the development of instruments and means of ascertaining the distances of objects, or, in military parlance, of range finding. In all the methods hitherto devised or employed, we believe it has been and is necessary to lay down a base line, and to have recourse to trigonometrical calculations. All this now appears to have been obviated by Dr. Luigi Cerbotani, a professor of the university of Verona, who has invented an ingenious instrument for ascertaining the distances of accessible and inaccessible points from the observer and from each other. The apparatus consists mainly of a pair of telescopes mounted on a stand, and fixed on a tripod for use. The telescopes are both brought to bear on the object, and a reading is then taken from a graduated scale on the instrument which, compared with a set of printed tables, gives the distance. Distances can be measured between far-off objects, and by means of a sheet of paper fixed on a drawing-board a rough plan of the country under measurement can be sketched. In the same way the distances of ships at sea or of moving objects on land can be determined. The apparatus appears to be well adapted for land surveying, but particularly so for military purposes. In fact, it is stated to have been already adopted in the German army in the latter connection, and it is about to be tried by the authorities of our own War Department. A practical trial was recently made with this instrument on the Thames Embankment by Messrs. A. Vreschner & Co., of 43, London Wall, who are introducing the invention into England, and which demonstrated its varied usefulness.—*Iron.*

PRODUCTION OF PURE GLYCERINE.—The first condition for the production of pure glycerine is the employment of perfectly pure tallow; as otherwise the foreign matter will enter into this glycerine solution, and cannot be eliminated. The tallow has to be cleaned before its saponification, and this is effected through a treatment with weak sulphuric acid or a soda solution. Certain organic matters are thereby destroyed, and dissolve in the alkaline or acid solution; and the molten fats float on top of the liquid, from which they are skimmed off into other vessels, to be decomposed. When this decomposition is completely effected, and the manipulation is properly conducted, we receive a raw glycerine, which need only be properly evaporated to give, after its distillation, a pure concentrated glycerine.—*Essler's Modern High Explosives.*

DR. HEINRICH WINKLER, in his recently published "Uralaltaische volker und sprachen," has made a careful comparison of the Eskimo with the languages of northern and north-eastern Asia. He reaches the result that it is unmistakably close relation to the Kadyak, Tschiglit, and Namollo, of the Asiatic coast, but is in no way connected with the Ural-Altaic tongues. It may have originally proceeded from the same elementary conception of speech; but it has developed a type of its own, differing widely from Asiatic standards, and much more closely approaching the structure typical of the great mass of American tongues, though in many respects presenting features peculiar to itself.

A POOR STORM GLASS.—The camphor barometer, or storm glass, is unequivocally condemned by H. H. Clayton as unreliable, for he finds that the height of the precipitate, in the glass, which gives the forecast of the "fair," "change" or "storm," does not depend upon atmospheric pressure or moisture, but upon temperature alone. Storms unattended by sudden cold pass without affecting the "indications" of the camphor solution, so that the instrument is merely a rude kind of thermometer.

What Railway Trains Can Be Run For.

The following communication from a writer who claims to be fully aware of the facts of which he writes, presents a very interesting account of the way railways are run at a minimum expenditure: On the Pennsylvania Central Railroad in the United States, in 1869, a series of experiments were made, with a view to ascertain the relative value of different coals as fuel for locomotives, which showed such remarkable results that premiums were offered to the engineers and firemen who would use the least fuel per ton per mile moved. The accounts for fuel, mileage and tonnage were so arranged that each engineer could, of his own knowledge, know the weight, character and condition of fuel charged to him. It was his privilege to refuse inferior coal; to compare his record with that of engines and trains like his, and to his pecuniary advantage to keep a close watch that his brother engineers did not get ahead of him in stealing coal from passing trains, or at dumping places. One engineer was so economical as to make several runs without being charged with a pound of coal, so great was his zeal in behalf of his company and his contempt for shippers.

During the first month's operations so many tricks were developed and exposed, so many complaints of unfairness were made, that a fresh start was taken, the engineers having meanwhile seen that the accounts were kept so as to show the weight of train per mile run, grade of the distance, speed, etc., thereby enabling a just distribution of the premiums to be made.

As each engineer thought his engine the best, he proposed to prove that *she* was, and would have no monkeying, no dirty, inferior coal, no short weights, no unnecessary application of brakes; he would have the best lubricators for his engine, and see that the car journals were well oiled; hence, before the expiration of three months, the railroad company found they had in their service the very best coal, oil, waste and tallow experts in the country, a detective force inferior to none, and the most capable of engineers upon the subjects of draft, slide valves, automatic oil cups, and intelligence of firemen.

Each month's statement of locomotive performances showed remarkable reductions; determined, by comparison, the value of different coals and the most economical class of engines. It induced the engineers and firemen to be careful and observant, and gave them unlimited cause for chaffing each other. The premiums distributed semi-annually ranged from \$300 to \$25, and those who received them deserved them and worked hard for them, too, while a saving of ten times the amount was made by the company.

Similar investigations have been made by other companies for many years, and thus the various roads have learned what it costs annually to operate locomotives or to pull trains over any mile of track on their roads, and what it costs to move an average train or single locomotive an average mile, and what it costs to pull one or any number of cars an average mile; and this average cost of operation per mile is being annually reduced for many reasons too numerous to mention in one letter. By finding the average cost on each separate road first, it is not difficult to find the general average cost of operating trains per mile on all roads throughout the United States. Those who make the estimate will find it to be about 17½ cents per train per mile; \$1.75 per ten miles, etc.

The Smoky Region.

No mining region of Idaho nor, in fact, any other in the West, promises more favorably than that of the Little Smoky Mining District. The developments of the season in the various claims and locations have been something remarkable, and but little has been heard or said about it owing to the fact that the interests are held by parties who propose to hold and work for their own benefit, and are not tooting for purposes of sale.

During the past week or two some of our leading citizens and mining operators have been visiting that camp looking after their interests and preparing for vigorous work next year.

In view of the wonderful development and promising future of Little Smoky district and of the fact that the route via Warm Springs creek, from Ketchum only 25 miles, is the most practical for that region, our business community has taken in hand the work of completing a good wagon road there, and a force of men are now at work from the terminus of the present wagon road, which reaches half way. The road will be completed to the base of the dividing ridges between Warm Springs creek and Little Smoky river this fall, and early in the spring it will be finished into the heart of the district, which will facilitate travel and traffic between that region and the railroad and Ketchum, and give us all that trade besides furnishing means of cheaper and greater transportation for their ores to the nearest and best market—the Philadelphia Mining and Smelting Company's works at Ketchum, which pay cash on delivery and highest rates for all ores.—*Ketchum Keystone*.

W. T. GARRATT & Co. have completed a large bell for a fog signal for Point Conception, for the U. S. Government. The bell weighs 31,000 pounds and has a clapper weighing 104 pounds. The clapper will be moved by the waves.

USEFUL INFORMATION.

LAUNDRY LESSONS.—Before beginning to wash, says *Good Housekeeping*, all the bod linen and underclothing should be placed by themselves, the table linen and tea towels put in another pile, the flannels treated similarly, while colored clothes should be laid aside to be washed last. Stains of all kinds on clothes should be washed out before they are laid aside for the regular wash. Spots on table linen usually yield readily to soap and warm water; wine stains should be covered with salt, wet and rinsed out; fruit stains may be removed by pouring boiling water over them before they are wet; coal oil and common baking soda mixed in equal parts will have the same effect. To remove inkstains dip the part in hot tallow or wash in new milk. If clothes are iron moulded, use oxalic acid, which will also remove mildew. Paint can be washed from any article by rubbing with lard and then washing.

Merino, woolen and silk underclothes and stockings are very easily spoiled in washing. Nons but the best soap should be used, and it should be dissolved in hot water. Do not rub the woolen clothes, but cleanse them by drawing them through the hands in and out of the suds. Rubbing shrinks and injures them. When clean, wring from the suds and rinse in warm, soapy blue water, stretch into shape and hang out immediately. Woolen and silk goods should never be washed on a stormy or cloudy day.

INVENTION OF THE POWER-LOOM.—The power-loom is the invention of a farmer's boy who had never seen or heard of such a thing. He whittled out one with his jack-knife, and after he had it all done, with great enthusiasm he showed it to his father, who at once kicked it to pieces, saying that he would have no boy about him that would spend his time on such foolish things. The boy was sent to a blacksmith to learn a trade, and his master took a lively interest in him. He made a loom of what was left of the one his father had broken up, and showed it to his master. The blacksmith saw that he had no common boy as an apprentice, and that the invention was a valuable one. He had a loom constructed under the supervision of the boy. It worked to their perfect satisfaction, and the blacksmith furnished the means to manufacture the looms, and the boy received half the profits. In about a year the blacksmith wrote to the boy's father that he should bring home with him a wealthy gentleman, who was the inventor of the celebrated power-loom. You may be able to judge the astonishment at the old home when his son was presented to him as the inventor, who told him that the loom was the same as the mode that he had kicked to pieces but a year before.

SUBSTITUTE FOR ORDINARY FLOOR COVERINGS.—The new paper-mache covering for floors is pronounced a successful substitute for matting, carpets, etc., and the process is comparatively simple. On the floor being made thoroughly clean, the holes and cracks are filled with paper putty, made by soaking newspaper in a paste made of wheat flour, water and ground alum—a tablespoonful of the latter to one pound of flour and three quarts of water, the whole completely compounded. The floor is coated with this paste and a thickness of Manila or hardware paper placed on this, a second covering of the paper being employed if two layers are desired. On this becoming dry, the paper is covered with paste, and a layer of wall paper of any desired style or design preferred is put on. On this becoming dry there are applied two or more coats of sizing, made by dissolving one-half pound of white glue in two quarts of hot water. The final treatment consists in giving the surface a coating of hard oil finish varnish.

STEEL RAILWAY SLEEPERS.—The Northeast railway company, Belgium, has invited tenders for 2000 tons of steel sleepers. This step has been taken probably because experiments made with metallic sleepers in Holland have shown that the renewals required amounted to less than 20 per cent in twelve years. The value of a metallic sleeper condemned as past service is also much more than that of an old wooden one. Steel sleepers will, of course, be found more durable than iron ones, and may possibly exert an important influence upon the future maintenance of permanent way.

A SHOE BLACK PLANT.—There is a tree which grows some 20 or 30 feet in height in India which is known as the "shoe black plant." It produces most beautiful flowers, which contain a quantity of astringent juice, and which, when bruised, turn black or to a deep purple. This liquid is used in Java and some other portions of the Orient, as a substitute for shoe blacking—a very poor one however. The tree would flourish in this State, and would be very ornamental for its flowers.

A CONVENIENT POCKET KNIFE.—Somebody has put a convenient device upon an ordinary pocket knife, which consists in etching a two-inch measure divided into eighths upon the blade. With this a man always has a handy rule by him and just when he needs it.

DON'T FOOL WITH A BUZZ SAW.—There is nothing gained by shaking hands with a buzz saw, or in making the acquaintance with an invisible edge that surrounds the outer portion of a circular saw where the teeth are found, for

there is a tooth to present in every point of the compass, and no introduction generally proves that the saw is most too enthusiastic in the line of friendship for the average individual.

PROSPECTIVE ENGINEERING CONTRACTS IN ENGLAND.—According to the *Engineering News* out of 161 bills passed by the late Parliament, 70 were for railway projects, 45 of them including the construction of 230 miles of new railway and other work at an estimated cost of \$67,005,000. Twelve of the authorized bills are for the building of 114 miles of railway just incorporated.

Among the other bills are, 12 tramways, 20 gas and water bills, 10 in connection with docks, harbors and rivers, and 14 town improvement bills. The most important bill passed was the Manchester ship canal bill, involving the construction of a canal 36 miles long at an ultimate estimated cost of \$50,000,000.

A NEW BRAKE-SHOE, consisting of alternate layers of compressed paper and wood one-quarter inch in thickness, is being tried on the Third Avenue line of the New York elevated railroad. Shoes of this construction have been used for 13 weeks, and made a total run of 9271 miles against eight weeks and 6000 miles of the ordinary metal shoes. This would equal 200,000 miles on an ordinary road, where the stops are only one-twentieth as many. There is much less wear on the wheel-tread, and it requires less time to stop the train.

THE BOILER that carries out water with its steam may show a large apparent evaporation, but the steam, being wet, is of much less value in the engine. A boiler should give dry steam in all cases.

TEMPERING COPPER.—The hardening and tempering of copper is supposed to be one of the lost arts, but a Boston inventor has shaved himself for years with a copper razor.

A PREVENTIVE.—To prevent the disagreeable odor of cooking cabbage, put a small piece of red pepper in with the cabbage and there will be no smell.

GOOD HEALTH.

Lemons and Their Uses.

As a healthgiving fruit the lemon is greatly undervalued. Its frequent use, especially in the warm season, is preventive of the malaria, that comparatively new and now fashionable disease. The juice of two lemons taken in half a glass of water before each meal is a powerful remedy for rheumatism, and it is also considered almost a specific for intermittent fever. The juice of one lemon taken three times a day in a cup of clear, strong coffee, will often cure chills and fever, when the disease is stubborn and unyielding to all other remedies. Lemon juice is cooling and purifying to the blood and a valuable regulator for many of the ailments peculiar to spring. For its good medicinal effects it should be taken without sugar, but always somewhat diluted; if clear its powerful acid has injurious effect upon the coatings of the stomach and the teeth. We know of a physician who used lemon juice in a case of smallpox, the only liquid given, and no other remedies. In 36 hours the disease was under complete control, and in one week was entirely cured.

Hot lemonade, with flaxseed simmered in it for half an hour, then strained and sweetened, is excellent for a cold, but, as it produces perspiration, it should be taken only upon retiring. The white of an egg beaten to a stiff froth and whipped up with the juice of a lemon, relieves hoarseness and soreness of the chest at once, taken by the teaspoonful half hourly.

The pulp of a lemon, hound on for three successive nights, is said to cure corns, and a few pearl shirt-buttons dissolved in the juice of one lemon forms a thick, creamy ointment that will almost surely cure them. So we find the medicinal properties of the lemon are many and varied; their value in culinary art is also great. The rind, thinly pared off, is an agreeable flavoring for custards, creams and blanc mange. It should be cooked in the milk and removed before the other ingredients are added. The yellow rind only is fit for use—the white part is always bitter. The juice of a lemon added to an apple pie, when the apples are not tart, or when they have become insipid in spring, is a great improvement. The grated rind, also, imparts a pleasant flavor, other flavorings being omitted. Used in cookery we find this acid fruit makes many delicious desserts and relishes, pies, puddings, jellies, pickles, candies, etc.—*American Cultivator*.

THE TOOTH EVIL.—American youth is getting more and more into a bad plight with defective eyesight and defective teeth, two important factors generally confessed in the physical sum total of good looks and health. Children of twelve wear spectacles, because parents have abused their eyesight by reading by an imperfect light, or while jolting in cars; their teeth are rarely sound, a writer in the *Bazar* affirming that the modern child often has hundreds of dollars worth of gold in its mouth before that age, and that children of sixteen often wear complete sets of false teeth. Not all the advanced science of modern dentistry can save teeth that are decayed before they are fairly

cut through a baby's gums. The mischief is beyond repair while the pearly little tooth lies hidden in the tiny jaw, and it is caused by the innutritious food the parents, particularly the mother, have eaten, the sweets, the sauces, the hot and ice cold drinks, the highly spiced diet which produces dyspepsia, and thins and disorders the blood. According to the dentist, the American tooth will eventually be as obsolete as the dodo. It is rapidly ceasing to exist, in spite of the care that is bestowed by those who have the means to pay dentists' bills, and, what is worse, in spite of human vanity. Fine teeth, white, wholesome teeth, are a priceless treasure, and if reformers would attack the dietary system of the "society" home as well as the clothing of modern women, they might accomplish a greater good than they are at present doing.

Infectious Diseases.

In reviewing a new German work on the above subject, by Dr. C. Liebermeister, *Science* states that he defines and classifies the different varieties of infectious diseases in a very clear manner. He first divides those diseases into the miasmatic and the contagious. By miasmatic, he designates those diseases whose germs are primarily generated outside of, and independently of, any diseased body. Contagious diseases are those whose specific germs arise only in organisms suffering the special diseases. Contagious germs can be transferred from a sick man directly to a well man by simple contact, and they may then produce the same disease in this second person. Miasmatic germs, however, are bred in special localities—in the soil and water—and they attack those who come to these localities, but are not transferable from person to person. The contagious diseases, therefore, are *epidemic*; the miasmatic, *endemic*. A third group of these diseases includes a number whose germs appear to require two stages of development—first in the body, and then outside of it—before they become qualified to infect a new body. Thus cholera is not directly transferable from person to person, and men are also attacked who never saw another sick with cholera. On the other hand, it is equally certain that cholera never arises in any place outside of the East Indies, except it is brought to that place by human agency. Professor Liebermeister's explanation of these apparently contradictory facts is very logical and satisfactory. He assumes that cholera germs, when first expelled from a diseased body, are innocuous; but, falling upon suitable conditions of temperature and moisture, they develop the fatal properties which render them deadly to those who come in contact with them. Typhoid fever exhibits similar contradictions as regards its method of transmission, but such contradictions become clear and harmonious in the light of this theory. The excrement of one typhoid patient in Pennsylvania, thrown out upon the hillside to ripen its deadly poison, killed hundreds of people in the town of Plymouth a few weeks later. The necessity for the instantaneous disinfection of all the excreta of these diseases should be one of the fundamental principles of sanitation taught to every child in every school in the land. Grown-up people do not go to school, and they learn slowly. Children at the right age should be taught such matters in the proper way.

FILTH AND LONGEVITY.—While the principle that cleanliness is an essential to health and longevity is an established fact of human life, now and then an exception is found that astonishes the physiologists. For instance, at Howdon, a dirty, desolate village on Tyneside, England, a boy was born who, at the time of his birth, had the following extraordinary number of grandparents and great-grandparents alive. The grandfather and grandmother on his father's side were hearty and well, and so were both parents of the grandfather and the mother of the grandmother of the grandmother. The grandfather and grandmother on his mother's side were active and strong, and so were both parents of the grandmother. The boy thus had four grandparents and five great-grandparents alive, each of whom was in active work earning his or her own livelihood. Yet this village where these hale and hearty grandsires and grand dams live and flourish is one of the most unsanitary in England. Open sewers run down the center of some of the streets. Until a few years ago the water supply was from one well. Houses have been condemned, wholesale, as unfit for human habitation, to the intense disgust of the people. Yet, notwithstanding all these adverse conditions, these families live and thrive.—*Phrenological Journal*.

COCAINE, which has proved a useful remedy for such a variety of ills, is now claimed as a preventive of seasickness by a Russian physician, M. Manassein, in St. Petersburg. Having had occasion to make several journeys this summer, he took with him some cocaine. He did not have a sufficient quantity to make his experiments on a large scale, but on all those to whom it was given it had an almost magical effect. One couple who had always suffered extremely from seasickness took some of the cocaine, and for the first time in their lives remained well, even during 48 hours of stormy weather. A girl of 18 who had been very ill for 24 hours received six spoonfuls, when her appetite returned and she was completely restored. Dr. Manassein has also discovered in cocaine an effective remedy for cholera nostras; and it seems probable that this new drug may prove useful in Asiatic cholera.

MINING SUMMARY.

The following is mostly condensed from journals published in the interior, in proximity to the mines mentioned.

CALIFORNIA.

Amador.

ANOTHER BIG STRIKE IN THE MAMMOTH.—*Dispatch*, Oct. 10: A lot of very rich ore was struck in the big tunnel at the Mammoth mine at Middle Bar a few days ago. The strike is considered as of great importance because it reveals the fact that the ledge extends down to so great a depth that the question of its permanency is settled. The point where the ledge was struck is about 800 feet below the surface of the ground, which of course proves conclusively that it extends at least to that depth, and possibly deeper. The strike will undoubtedly inspire renewed confidence on the part of parties who are developing other mines in that vicinity. The extent or thickness of the ledge at this depth is not yet known, as the progress of the tunnel is necessarily very slow on account of its immense size, and further developments are awaited with great interest, not only by those who are interested in mining but by the public generally.

ANOTHER MINE SOLD NEAR MIDDLE BAR.—We understand that Mr. Paul Ciama, of James Bar, just across the river from Middle Bar, sold his quartz mine a few days ago to Drs. Donnell and Lloyd, of Oakland, who will commence work on the mine as soon as they can make the necessary arrangements. They also intend putting up a fine mill some time in the near future, if the mine should prove to be as good as anticipated, or as good as the other mines in that vicinity. The price paid for the mine we understand was \$12,000, one half of which amount was paid in cash when the sale was consummated. This mine is located on the Calaveras side of the river, and is near, or joins, the celebrated Gwinn mine. It is also just across the river from the well known Mammoth mine, and there can be but little doubt that it will prove a valuable piece of property.

THE KENNEDY MINE.—We are informed that the parties who came up here last week for the purpose of resuming work on the old Kennedy mine, have ordered the lumber, machinery, etc., necessary to put up the hoisting works, and that the work of hoisting water and retimbering the old shafts will be commenced as soon as the necessary machinery can be got in working order. The new machinery will be run by water power, and when they get the old shafts re timbered they expect to sink down several hundred feet, and thoroughly prospect the mine before putting up a new mill.

STRIKE.—Amador *Sentinel*, Oct. 7: A strike that may be of some importance was made at the Moore mine this week. The rock taken out was of a very good character, but we did not learn the extent. J. Boomershire, of San Francisco, came up Tuesday, and in company with Ed. Bowers, will re-open the old Belding mine, between Dennis Kelly's place and the Mokelumne river. The St. Julian commences with H. T. Tripp as contractor, a 300-foot extension of the tunnel recently run to get under the old tunnel, and make connection with winze where Matson, Price and Chatham found the big strike last spring. A new bonanza has been discovered in the lower level of the Empire mine of Plymouth. What its extent is has not been developed, but it is believed to be something immense. On Saturday a streak of black metal was struck in the face of the drift now being run from the big tunnel at Middle Bar. We understand that this strike is made just about where the lead of the Mammoth mine might be expected to be found. We are pleased to announce this week that work will be commenced on the Kennedy mine as soon as it can be done. A large contract was entered into with the Pioneer Saw Mill, to furnish the necessary timbers and lumber, which positive action makes the commencement of work a certainty. The first work will be the repairing of the shaft, and if the body of ore is found as represented, then a 40-stamp mill will be erected. The Kennedy rock is low grade, but there is said to be plenty of it, and now-a-days rock that pays only four or five dollars per ton can be profitably worked.

COLLAPSED.—Amador *Ledger*, Oct. 10: Work on the Kitteridge claim, 2½ miles west of Jackson, has collapsed. Forty tons of ore was put through the mill, and the gold obtained therefrom sold for \$29.50. When the full extent of this flattering output dawned upon those who have been diving into their pockets to keep things moving, they concluded that the wisest thing to do was to pocket their loss, and quit in disgust, which they did. To get this 330 crushing, they have gone to an outlay bordering on \$3000. The ditch which they have constructed to convey water to the claim will no doubt be taken off their hands at its original cost by the Amador Canal Company. Some of the parties to this disastrous mining venture vow that they will never again touch a quartz claim west of the main belt. It may be that good pay ore exists in paying quantities west of the mother lode; but all experiments to develop a mine in that quarter have so far proved ruinous failures; and this ought to be sufficient to cause capitalists to go slow in expending money where experience teaches there is but a slim prospect of reaping any adequate returns. At the Moore mine some ore has been met with in the sinking operations which has yielded as high as \$20 per ton. The two-stamp mill on the Kitteridge claim has been sold to all parties working the Dunning claim, and is kept running on ore from that mine. The plates look well, and indicate a yield of at least from \$6 to \$7 per ton. Work on the Kennedy is to be started at once. Knight & Co. are engaged to put up new machinery at the mine.

Calaveras.

MINE SOLD.—Calaveras *Chronicle*, Oct. 10: We understand that Col. Robinson has sold the Bryan mine to Dr. E. Donnelly, of San Francisco. Dr. Donnelly will immediately put on a force of men and take out ore. He will lease 10 stamps at the Boston mill. The mine is looking exceedingly well, and we have no doubt but that the doctor has secured a valuable property. There are many good properties in this camp that could be made productive if developments were pushed. The signs of the times indicate that there is a growing activity in quartz mining throughout the State. We feel confident that "Old Calaveras" will lead the procession,

for within her borders are some of the best mines to be found anywhere. The "Oneto mine" near Middle Bar, and on the Calaveras side of the river, lying between the great Nevill Bonanza and the Gwinn mine, was sold yesterday, we are informed, to New York parties. The price paid we did not learn, but we suppose it was a goodly sum as the mine is understood to be very extensive in low-grade ore besides rich streaks of black metal such as the Nevill contains. Mr. Joseph Lefoy of this town has the honor of promoting the sale of this valuable property. A number of mining men have visited our town this week, giving evidence that our county has attractive features in her mines.

Inyo.

BASTO'S CLAIM.—Inyo *Independent*, Oct. 10: From a new mine at Cerro Gordo John Basto is getting out some good ore. Four samples assayed by J. A. McKenzie gave the following results: No. 1, 71 per cent lead, 69.25 ozs. silver, total per ton, \$89.52. No. 2, 53½ per cent lead, 42.52 ozs. silver, total per ton, \$54.97. No. 3, 75 per cent lead, 82.62 ozs. silver, total per ton, \$106.81. No. 4, 50.30 ozs. silver, total value per ton, \$659.77. Mr. Basto has sold out his interest in the lease of the Union mine to his late partners, and will devote the whole of his time to the development of this new claim.

SAN CARLOS.—This virtually new mine, but really old location, is showing up remarkably well of late. Mr. Densmore reports a 2½-foot vein now opened in the mine, getting wider as the drift is advanced. Samples of the ore recently assayed contained 170 ounces silver per ton, \$5 to \$12 gold, 88 per cent copper and 40 per cent lead. Mr. Densmore has sent some of the ore to the Nevada State Fair at Reno, where it is sure to attract the attention of mining men. A shipment of ore from the San Carlos will be made to San Francisco in a few days.

GOOD ORE.—Recently Jack Wilson and Jerry Fitzgerald shipped a lot of ore from Lee district, east of Keeler, that netted them over \$200 per ton, after all expenses, including hauling and freight, were paid. A small lot of ore went as high as \$600 a ton.

PANAMINT.—A letter received from Mr. N. G. Fairman states that the work of building the road to Panamint is progressing more rapidly than was expected.

UNION MINE.—A change has been made in the Union mine, Cerro Gordo. Pat Clinton and others have bought out the lease of Morrison, Casey, Basto and Lockett. Pat had intended to make a trip to Europe this fall but this engagement has forced him to give it up. The ore body now in sight in the mine is very encouraging to the new lessees, and there is every chance that they will do well. The other partners are Thomas Boland and David Holland.

Mono.

STANDARD CON.—Bodie *Free Press*, Oct. 12: The retimbering of shaft progresses very satisfactorily; the ore bodies hold well with promises of improvement. Oreshipped to mill 315 tons. Bullion shipped Tuesday, 6th, \$7558.

Nevada.

DIVIDEND.—North San Juan *Times*, Oct. 10: On October 1st the Delhi mine paid its second dividend of \$70,000. This makes \$20,000 this company has paid out in dividends since the mill has been put in operation. As the mill is a small one, running only eight stamps, and the mine only just developed those figures are remarkable. The tunnel now being run on the 200-foot level is about 300 feet, and although the ledge has not yet been tapped, the workmen now expect to strike it daily. The company is very well satisfied with the prospect of future developments.

ORLEANS MINING COMPANY.—Grass Valley *Union*, Oct. 10: The Orleans Mining Company will receive bids up to and including to-morrow to sink the shaft of their Prescott Hill mine 100 feet deeper than at present. The mine has an old shaft down to the drain and working tunnel 165 feet below the surface, and 100 feet of the shaft has heretofore been sunk below the tunnel level. The new work is to put this down 100 feet deeper in order to give plenty of backs. At the bottom of the shaft, which was sunk several years ago, rock of good quality was found, but the ledge was small, and the superintendent was not authorized to sink deeper. The company has finally concluded to go deeper, as there is encouragement to believe that 100 feet will give plenty of good backs, and bring the walls nearer together than they have been found above. The mine has steam hoisting and pumping works upon it. Water is not troublesome, being easily handled by pumping it up to the tunnel level. The work of driving the tunnel is going ahead as usual, and quartz is being stopped out, but the backs above that level are to a great extent exhausted. The company has been going slowly with its work for some years, seeming not disposed to contend with the water by pumping, but from an assessment recently put upon the stock it looks as if the work of more extensive development is now to be entered upon. The stock is well held, and by those who are well able to put the mine in the best shape for regular working in the future.

Placer.

FOREST HILL AND VICINITY.—*Argus*, Oct. 8: The Baker Divide Mining Company have let a contract to the Phoenix Iron Works, of San Francisco, to run 2000 feet of bedrock tunnel in about one year's time, by means of rock drills, operated by compressed air, which will be forced into the tunnel by steam power. It is expected the machinery will be shipped this week and the engines built convenient to wood and water on the brow of the hill, overlooking Shirt Tail canyon and about 600 feet above the mouth of the tunnel. The company has already run into a hundred feet of tunnel and built a boarding house, office and other buildings. They expect to get into the same channel that the Mayflower Company are working on, at a distance of about 2600 feet from the mouth of the tunnel. The mine at Damascus is working on what is supposed to be the same channel. They have a breast opened out about 400 feet long and 20 feet high. For the past month or two they have been taking out on an average of 500 ounces per week. The Excelsior mine has struck some nice looking gravel, which seems to improve the further they get into it. Messrs. Breece and Wheeler, also at Bath, state that the raise-up has brought them into good gravel again. Part of the Hazard Company's machinery has arrived and is being put up as fast as possible. Thus the mining boom keeps increasing, and we

have lots of ground undeveloped yet, awaiting capital to open it out. Mr. A. R. Morrison, late of North Bloomfield, is now assistant superintendent at the Mayflower mine.

THE HAZARD MINE.—Placer *Herald*, Oct. 10: We learn from Supervisor Keown, superintendent of the Hazard mine, near Michigan Bluff, that he is working about 20 men all told, and expects, with good luck, to have everything in readiness for putting on steam by the first of next week.

BIG NUGGETS.—We received a pleasant call from J. B. Hobson, of Iowa Hill, while at Auburn last Tuesday on business. He has three men at work, on the old Independence mine close to Iowa Hill, drifting, and the results are proving very satisfactory. For lack of water they wash the dirt with a rocker, and thus far one rocker has washed out from 12 to 20 ounces a week. Mr. Hobson showed us two pieces taken out recently, the larger of which weighed about 15 ounces. The old Independence has paid well with a hydraulic mine, but Mr. Hobson is so well satisfied with his drifting experience that he has about concluded not to fit up for hydraulicking any more, but to depend entirely on drifting.

Shaota.

IRON MOUNTAIN.—Republican *Free Press*, Oct. 10: A party who was at Iron Mountain, Thursday, informs us that there are about 120 men employed, most of whom are laborers. The work of leveling up a site for the saw and quartz mill is progressing rapidly. The superintendent says that more men would be employed had he the necessary accommodations. As it is, the men are obliged to sleep anywhere that they can find a soft spot.

Siskiyou.

HAMBURG BAR.—Cor. Yieka *Union*, Oct. 9: There are only three river claims working here this season, viz., Mapleson's, Kittewood & Co.'s and that of Martin Andrews. As far as we can glean the former is not paying very well, but may yet come out before the end of the season. At the Kittewood claim 218 ozs. were taken out at one clean up, and the company are ahead on the season. They expect large returns for this season's work. Martin Andrews has been making more than expenses so far this season. He has just finished moving the derrick and expects to make a big clean up before high water closes him out.

SCOTT BAR.—There are less than the usual number of claims running here this season, the operations being confined to drifting claims and one or two hill claims, which are being run by water from the San Jose ditch, now the property of Mr. G. A. Hicks. All of the claims being worked, so far as we can learn, are paying well. The oldest inhabitants have never seen Scott river so low as at present, but if a good supply of water is had next season mines now idle will be operated next summer. During the summer past there have been many quartz prospectors here from various parts and all seem to be pleased with the country and the outlook, and are of the opinion that, at no distant day, quartz mining will be the predominating feature of the whole section, but time alone will tell.

OAK BAR.—I visited Barton & Perkins' claim, where I found Chas. Parker busily engaged in preparing a face to start a new tunnel, some 200 yards down the river from the old tunnel. Mr. Parker escorted me through the old tunnel. This is one of the most extensive and valuable mines on the Klamath river and pays the owners very handsomely for their extensive outlay. Mr. Parker informs me that two men, in one day, took out from this claim over \$400, but of course such strikes are not made every day, but good wages are obtained daily nevertheless. Over 800 feet of tunnel have been run, including crosscuts, etc. The tunnel pierces the channel some 200 feet, but still no back wall has been reached, and the indications are that they have more rich ground than 50 men can drift out in the same number of years. They have also a ditch over a mile in length taken out of the river, which is a valuable piece of property. The ditch continues to the point where the new tunnel is being started, and the water which it carries is used to wash the gravel taken from the mine. This ditch can also be utilized for mining and irrigating purposes further down the river, and the privilege will eventually command a large price. On the same evening I paid Jackson & McCleary's mine a visit, which I was informed is paying well. While at Oak Bar last Thursday I met Mr. Sen. Mott on his way from Virginia Bar to Hamburg. He informed me that on the day previous he got nearly two ounces from less than a pan of dirt at the Centennial claim.

San Diego.

POORMAN'S DISTRICT.—Cor. San Diego *Star*, Oct. 9: The Paymaster Mining Company are the owners of some valuable prospects which are as yet only partially developed in Poorman's mining district. The above named district is located in San Diego county, 22 miles northeast of Cactus, a telegraph station and siding on the Southern Pacific Railroad, 23 miles west of Yuma. A 10-stamp mill has lately been erected and is now in full blast upon rock which averages \$72 per ton, and as there is at least 10,000 tons in sight, some idea can be borrowed of the value of this, San Diego's latest "bonanza." Water is forced to the mine by hydraulic ram, from a point on the Colorado river, eight miles distant, at which place there is also an abundance of wood for fuel. The above items may be of interest to some of your readers in view of the fact that it is proposed to resuscitate the old and now defunct Colorado Road district for the purpose of improving the roads which must of necessity be traveled by teams in the employ of the above company. The road from Cactus to the mine, runs through a level stretch of sand, and in my humble opinion, cannot be improved short of planking the whole distance. Between the mill and the river there are a few places where the judicious expenditure of, say \$50 would benefit the road, for which purpose a Deputy Roadmaster could be temporarily appointed.

JULIAN AND BANNER MINES.—Cor. Calico *Print*, Oct. 10: Well, our mines are on the produce and making quite a stir in mining circles by the steady stream of golden bars that is being put out. The most promising mine in the district is doubtless, the Stonevall. The mine is situated on a spur of the Cuyamaca mountains about 10 miles from Julian City and is owned by James Fulton & Co., who are working on an immense body of fair grade ore. The Ready Relief mine is still producing enough ore to keep their ro-stamps pounding. The mine looks well enough to induce some old mining men to at-

tempt a purchase, they are sparring around trying to buy it and the Redman and Hubbard, but the present owners do not seem inclined to sell. The old San Diego mine has recently been sold to the company that is working the Owens. They have put several men at work and expect to develop a rich thing. The Owens is being worked by some Nevada men and they may strike it rich as there was some very rich ore taken from this claim in bygone days. Sandeman and Hanson, two old Julian boys, just returned from Arizona, are at work on the Big Blue with good prospects. Gardner is getting out another crushing of \$750 rock from the Blue. Crays and Mallock still hang to their old works in the Blue Hill and will soon have a ro-ton crushing of ore. New faces are seen on the streets of Julian every day and the camp is quite lively to what it has been for the last ten years. Levi & Co., think the camp is lively enough to justify them in putting up a brick building for their increasing business.

Sierra.

PROSPECTING QUARTZ.—*Tribune*, Oct. 10: B. F. Littlejohn and another party have for some time past been prospecting the old Arastra ledge, at Middletown. A number of years ago a man by the name of Cook worked on the vein to the depth of about 25 feet, and crushed the ore in arastras, which he built. That was 20 years ago, but it is handed down that Cook made the rock pay. Mr. Littlejohn and partner have started a tunnel 125 feet below surface and expect to tap the lead with it by running 150 feet. They now have the tunnel in 25 feet. We hope they will succeed in getting the tunnel into the vein, and there find something rich.

GOOD RETURNS.—*Alt. Messenger*, Oct. 10: The cheering news comes down the ridge that the Ruby drift mine is yielding very good returns. But a small force is at present being worked.

Tuolumne.

GROVELAND ITEMS.—Cor. Tuolumne *Independent*: David James, of Big Creek, has a promising quartz vein on the Tuolumne river near the mouth of Humburg creek. The rock shows free gold, and if it continues to develop will prove a rich find. Messrs. Hubbard & Co. are reported to be doing well in their river claim, and if they are not troubled by freshets this month they will have a handsome lot of gold to show for their energy and perseverance. The Santa Maria mine has been shut down again, and we think the mine has not proved a success lately.

Trinity.

LIVELY CAMP.—*Journal*, Oct. 10: Deadwood, Trinity county, is the liveliest quartz mining camp in California, more work being done there and in French Gulch district, and more money being taken out than elsewhere. In passing through Deadwood this week all was found activity and business. The camp is fast building up, a number of new buildings having been erected since our last visit only a few weeks ago. Lack of time prevented a visit to any of the mines, but reports continue to be most favorable, and the tooting of steam whistles at the several mills gave notice that they were at work adding to the bullion yield of the Golden State.

NEVADA.

Washoe District.

HALE & NORCROSS.—*Enterprise*, Oct. 10: The main south lateral drift connection on the 3000 level was completed last Monday morning, uniting that portion running from the bottom of the deep winze with the portion coming north to meet it from the Combination west drift. So accurate was the survey and the conducting of the work that the two drifts came together fairly and squarely with no appreciable deviation or discrepancy. The only difference was in the floor of the drifts, that from the Chollar side being run on a slight upgrade for drainage, while that from the Norcross deep winze was not kept quite down to the grade for fear of cutting below the trines at the outcome. As it was it came out just 18 inches above, which was far better than three inches below. This slight discrepancy is being graded down properly and drain boxes put in. Next week, or when the track floor of this drain is properly graded and everything in correct trim, the work of crosscutting west will be commenced at various eligible points. This main lateral drift north and south having been run along the east or hanging wall of the ore vein, the proposed crosscutting west necessarily constitutes a very important move, as practically demonstrating the value of the 3000 level. Being well prepared with a water drain, and the big hydraulic pump at the Combination being nearly ready to take an unlimited amount of inflow of water, these crosscuts can be pushed west without fear and regardless of the known existence of strong flows of water, which has been demonstrated by crosscuts heretofore which had to be abandoned or suspended. Yet the very existence of this water is an important point, as an almost sure indication of a main heavy ore vein lying next to the west or foot wall of the old Comstock lode, a deposit to which the veins of ore heretofore found in the lower levels may be merely feeders.

CHOLLAR.—The connection with the Hale and Norcross on the 3000 level being completed, development work in this mine is resumed. It will be borne in mind that the west drift from the Combination shaft is run in the Chollar ground on this 3000 level 60 feet south of the Norcross line, and that the lateral drift north to join the Norcross drift branched off from this drift at a point 120 feet west from the Combination shaft. At this point, or "switch," a drift to the southward was started day before yesterday to explore the mine in that direction. This drift, commenced in the east side of the ore vein, is in about 20 feet, swinging around to the left and is all in firm white quartz, carrying small streaks and spots of ore giving low assays. It is proposed to run this drift in a southwesterly direction, which will carry it diagonally across to strike the west wall in going 150 feet. Thus it will be seen that this will be both a lateral drift and a crosscut, exploring the vein to the best possible advantage, the more especially as it starts in the solid quartz of the main vein, which shows a very strong degree of mineralization in that direction. The pressure pipe for the new or duplicate section of the big hydraulic pump in the Combination shaft, has all arrived and is being rapidly placed in position. The whole will be in full operating position in a week or ten days, ready for any water that the lower levels can furnish.

CON. CALIFORNIA AND VIRGINIA.—From the 1750 level about 110 tons per day continues to be the daily yield, extracted on company account. This is reduced at the Morgan mill on Carson river, and averages about \$20 per ton. The lower portion of the old Consolidated Virginia shaft from the 1550 to the 1200 level is now being repaired. Above that the shaft is all right, allowing the double deck cages to pass with perfect facility. A small force of miners are working in the Jones lease section, tributary to this shaft, opening up drifts and preparing to take out plenty of ore when the Carson river shall furnish the requisite motive power for the mills.

STERRA NEVADA.—The west crosscut from the north lateral drift on the 520 level, 1000 feet north of the shaft, was advanced 40 feet during the past week, making a total length of 409 feet. It is now running in heavy vein porphyry and clay, with streaks of quartz, and quite a seepage of water, indicating proximity to an ore vein.

CROWN POINT.—About 100 men have been put on this week in Crown Point and Belcher, putting both mines in good order for active ore extraction. Some ore is being extracted now, but as soon as the Carson river will furnish motive power to the mills a full force of miners will tumble the ore out lively.

OPHIR.—The old Mexican shaft has been put in complete order for ore hoisting work. The drift west from the shaft on the 300 level is now in the old Ophir ore section, and the prospect for a plentiful supply of ore of a remunerative milling grade, is good. This drift will be continued through to the west wall.

ANDRES.—Good progress is being made in the crosscuts west on the 175 and 375 levels, both running in favorable vein matter and quartz giving low assays. That in the lower level shows the best.

YELLOW JACKET.—The regular daily yield of 160 or 170 tons continues on the old workings on the 1300 level and above, keeping the Brunswick mill running steadily.

KENTUCK.—Still running along regularly, keeping the Rock Point mill steadily running on ore from the old upper workings.

ALTA.—Good progress continues to be made in the west drift on the 700 level. The rock is hard blasting, but works well.

GOULD & CURRY.—The west crosscut on the 1000 level near the Savage line is now in about 150 feet. Material drift vein porphyry.

BEST & BELCHER.—On the 1000 level west crosscut No. 2 is in about 280 feet. Face in vein porphyry, with streaks of quartz and clay.

UNION CONSOLIDATED.—West crosscut on 500 level in about 100 feet. Material soft vein porphyry, quartz and clay.

MEXICAN.—Middle crosscut east still in wet vein porphyry, quartz and clay.

MONTA CRISTO.—New shaft down 165 feet, with bottom in hard blasting rock.

Columbus District.

MOUNT DIABLO.—Candelaria True Fissure, Oct. 10: The incline has been sunk 17 feet during the week, and the west drift on the sixth level has been advanced 12 feet in the meantime, and has followed a small streak of low-grade ore for that distance. The east drift, on the sixth level, is in 130 feet, and the east drift, on the fifth level, is in 202 feet. A winze has been started from the east drift on the fourth level to connect with the drift on the level above. The west drift from the winze, connecting the fifth and sixth levels, is in 26 feet and shows some low-grade ore. The east drift from this winze is in 41 feet and shows a small streak of good ore. The raise, between the fourth and fifth levels, has advanced eight feet and is showing a foot of ore of good grade. A little ore is being taken from the east drift on the second level. A drift has been started from the south crosscut from the Mount Diablo adit.

Eureka District.

ORE SHIPMENTS.—Sentinel, Oct. 10: During the week ending yesterday, ore shipments were made as follows to the twin reduction works in town: To the Richmond works—Dunderberg mine, 16 tons; Silver Lick, 77; Lone Pine, 21; Hamburg, 70; Mariposa, 1; Bay State, 30; Home Ticket, 22; Irish Imbasinder, 15; Potter, 7; Geddes and Bertrand, 3; and White Pine, 5. To the Eureka Con. works, Hon. George Ernst shipped in from his properties in Nye county, 9 tons of ore of good quality. From the Battery mine one of "Boss" Saddle's properties, 8½ tons were shipped.

Granite District.

CLEAN-UP.—Cor. White Pine News, Oct. 6: Wilson Carey, who has been at work at Granite mining district, about 25 miles south of here, came to town on Sunday last, after making his clean-up on the lease he had on the property of Fred Gotchett. He has sent his bullion to the mint at San Francisco, and as soon as he gets his returns he intends to go back again and work until snow flies. George Judson, who is also working at the same place on a mine of his own, has made a mill clean-up. Tommy Kinney and Judge Doolin are also in town from Granite. They have made their clean-up on the mine they had leased from Fred Gotchett. They are going to get a new lease and intend to work all winter.

Indian-American District.

NEW MINES.—Silver State, Oct. 12: L. F. Dunn is up from the new mines in what was formerly known as American district, but which was subsequently consolidated with Indian district. He says the new mines were discovered by G. B. Dunn and Charley Mackey. The principal leads are called the Governor and the Reed. They are parallel veins, about 300 feet apart. Between them is vein matter, and one appears to be on the hanging wall and the other on the foot wall of an immense fissure lode. There are streaks of ore in both claims that assay as high as \$4000 per ton. The formation is what geologists call transition slate, which crops through limestone capping. The leads crop boldly along their course some 1200 feet, and are situated about four miles from the Lovelock and Bernice stage road. There is a shaft 50 feet deep on the Reed, and the lead looks well and carries several feet of good milling ore.

Star District.

RICH ORE.—Silver State, Oct. 9: Peter Woolcock, of Mill City, returned yesterday from Denver, Colorado, where he went with a carload of ore from

the Sheba mine, in Star district. The ore assayed over 800 ounces of silver to the ton, and yet the Sheba mine which produced it has been lying idle for years, Mr. Woolcock being the only person that would risk what money was necessary to get it in working order. He is, however, an experienced miner, while the old owners of the property were only "stock board" miners.

Sprucemont District.

STARTED UP.—Cor. White Pine News, Oct. 6: The old mining camp of Sprucemont has come to the front once more, and has started up again. There was a great stampede from Jasper to Spruce. George Madelina has got a contract for 70,000 bushels of coal, and I hear that they are going to push things pretty lively before snow flies.

White Pine District.

HAMILTON.—Cor. White Pine News, Oct. 6: Just as I have written you in former letters, the winter troubles here have culminated in shutting down all the operations of the Sweetwater company, and that immediately. The great part of the miners on the hill have been discharged and the ore teams stopped yesterday. The mill will simply run out what ore is on the dump—only a few days' work. To make matters worse, the Manhattan mill closed down for good Saturday night. Nearly all work in the district is to be suspended, which means the taking away from this community of about \$5000 in hard cash per month.

ARIZONA.

SILVER.—Prescott Courier, Oct. 7: Jack McDonald and helpers are taking rich silver ore out of the Blue Dick mine. The ore in the Catocin mine is said to be five feet thick. Vanderbilt & Hudson will very soon ship another carload of silver ore from their mine near the Agua Fria. Good rock is being piled up in Big Bug district, and the mill men are watching the clouds, in hopes of seeing them spill themselves, so that they can take the gold out of the rock. Dry as it is, placer miners of Lynx and Hassayampa creeks are taking enough gold from the gravel, to keep them in spending money. Peck tailings continue to pay. Ditto, Aztlan, Morgan & Co., continue to sack silver nuggets. A great deal of "title" work is now being done in all the districts. The Osborn boys came in to-day from Castle creek and brought with them something over \$1000 in gold bullion, the result of a 20 days' run of their arastras on ores taken from the "Dummy" mine. The "Dummy" was discovered some time since by John Osborn, and while parallel with, is not an extension of Bob Groom's mine, which has yielded so well for several months past.

COLORADO.

ELK MOUNTAIN.—Pilot, Oct. 8: The Pioneer stamp mill in Irwin, owned by Wm. H. Webb, of New York, has been sold through Judge Karr to David Kline and Fred Kreuger, of Denver. The consideration paid is less than \$10,000. It is the intention of the new owners to remodel the mill and put it in operation at once, making a market for the low grade ores of the camp. The Queen of the Gulch mine, which is the same vein of the Augusta, on the Dark canyon side, has been sold by Scott McCulloch, the owner, to a Pennsylvania company for the nice little sum of \$10,000. The new hoister at the Sylvatic mine works like a charm. Work has ceased on the Dutch Girl, on Brush creek, for the winter. Frank Broderick has the extension of Fitzgerald's Little Daisy mine in Redwell basin. He has driven a tunnel 40 feet on the vein; has got the same character of ore as the Daisy, and he intends to ship a carload soon. The Jewett lode, on Treasury mountain, has been worked for this year, and shows a vein of four feet, principally galena.

CRYSTAL CITY.—The Black Queen mine is more than holding up its old reputation, and the finest ore yet taken out is being sacked. A force of men is at work and the mine can be looked upon as a steady producer from now on. The Lead Chief, on White House mountain, is proving up a bonanza, and shows eight feet of the finest kind of lead carbonates. The Governor Tabor is being worked and shows up an immense body of lead carbonates. The work is being done in the cave which is one of the wonders of Rock creek.

IDAHO.

WORK TO BE RESUMED ON THE EUREKA.—Wood River Times, Oct. 7: Yesterday morning Colonel Wall started up work on the Eureka mine, at Pullman. For the present operations will be confined to pumping out the water and cleaning the drifts; but when this shall be done ex-Marshall Shaughnessy will come up to look at the vein and work will then doubtless be resumed for good.

BACK FROM ERA.—E. A. White has returned from Era, in Lava district. He says the formation is very favorable to the existence of mineral-bearing veins—of which there is abundant evidence. The best showing there is, of course, the Horn Silver. On that mine there are five openings within a length of 150 feet, all of which shows rich ore. Day before yesterday it was stated that a face 10 feet in width, of ore that will average 90 ounces, was being exposed, with evidences of there being more beyond. The town of Era is lively, with much building going on; but the owners of the claims in the vicinity being generally poor, it will take some time for the region to "boom."

ORE IN DEPTH.—During the past day or two the face of the prospecting drift or tunnel, on the fifth or lowest present level of the Parker mine, has shown very favorable indications. Bunches and spots of galena have been encountered, and the formation has shown a "kindly" or mineralized appearance which is accepted as an indication of the proximity of an ore-body. This is most encouraging, as the fifth level is opened at a depth of between 700 and 800 feet, and is thus the greatest depth yet attained in any Wood River mine.

MONTANA.

BUTTE OUTLOOK.—Miner, Oct. 7: The report of the work done and developments made in the mines of this district during the past week are of the usual encouraging nature. The work of sinking the shafts of several of the leading mines is progressing favorably and is a source of much comfort to the people of this district and shows the enterprise and faith of

the respective mining companies. The developments made on the lower levels of some of our mines, indicate that the ledges of this camp are good for many hundreds of feet deeper than any mine in this district has yet been sunk. The several mining superintendents seem to appreciate this, and are acting accordingly.

MEN EMPLOYED.—News, Oct. 8: As an evidence of the importance and business of Walkerville, the number of men on the pay rolls of the various mining companies in the immediate vicinity are herewith given: The Alice company employs 300 men, the Lexington 200, the Moulton 150, and the Union Consolidated 200, making a total of 850 for these four companies. Besides this, there are a number of smaller mines, employing at least 200 men, thus making the working force of miners and others employed by mining companies over 1000. These figures must convince all that Walkerville is a busy camp, and contains more of the bone and sinew of the land to the square inch than any town of its size in the country.

THE ALICE.—Everything at the Alice is running along in the usual smooth manner. The new hoisting works is completed and is a very commodious and nicely finished building. The mine never looked better. The north crosscut on the 800-foot level is in good working ground and good progress is being made. This crosscut is now in about 120 feet and has to be carried in 80 feet farther before the ledge is encountered.

MAGNA CHARTA.—The south crosscut on the 700-foot level is now in 100 feet, and the second south ledge will be struck in about 25 feet more. The north crosscut on this level was started a few days ago and fair progress is being made. The recent strike in the northern part of the mine, on the 400-foot level, is improving in value daily. The stopes from every level on the 100 to the bottom are producing well.

THE MOULTON.—Superintendent J. K. Clark is more than pleased at the present good condition and the very flattering future of the Moulton Company's prospects. The mine is looking well in all directions and the immense ore reserves are being increased in number right along by the discovery of other chutes of ore. The recent declaration of a \$30,000 dividend shows that the affairs of the company are in worthy hands.

MONTANA COPPER COMPANY.—The mines owned by the Montana Copper Company are all looking well and are producing the usual quantity of ore.

THE LEXINGTON.—It is said by persons who profess to know, that the Lexington mine looks better than it has for several months. Recent important developments have been made in the upper portion of the mine. Larger hoisting machinery will be procured and erected in as rapid a manner as possible.

THE ANACONDA.—The work of sinking the main shaft of this mine is progressing favorably and the 1000-foot level will be reached in a short time. The work of supplying the large smelter with ore rests, mainly with the St. Lawrence mine, which property is looking grand. The several stopes in this mine are looking well and producing large quantities of ore.

BURLINGTON MINES.—The Burlington mine looks well and sinking is carried on with favorable progress. There has been considerable difficulty experienced of late with the large quantity of water, but recently a large pump has been put in the shaft and the water now coming into the shaft can be easily handled. The Blue Bird large ore bodies on the 300-foot level never produced better than at present. The other portions of the mine are producing well.

MISOR NOTES.—Messrs. Bews & Co. have secured another year's lease of the Wild Bill mine, and predict a grand future for their property. Messrs. Lawry, Combs & Co. are actively engaged on the Pozzer mine. The shaft is now down 165 feet and will be immediately sunk an additional 50 feet. The lessees evidently have a good thing in the Pozzer. The Martin Bros. & Co. are working the east end of the Rock Island mine, with encouraging prospects. They are now sinking the shaft below the 75-foot level. The ledge at the point looks well, and some very good ore is being taken out. The Silver Queen mine is worked on lease by Messrs. Buzza, Penrose & Co., and looks well. The ledge was encountered in the north crosscut of the 95-foot level yesterday, and some very rich ore was found in it. The lessees are very jubilant over their prospects. The Elva Orlu mine continues to look well and the work of erecting the new hoisting engine is progressing favorably. The Goldsmith mine still looks well and the rich ore body on the 135-foot level is opening out in all directions. This is a very valuable property.

NEW MEXICO.

NOTES.—Socorro Bulletin, Oct. 7: Full shifts are accomplishing the 150-foot contract in the Anchor mine. The Magdalena Queen is dumping fine lead ore. McLeish & Leddy are working their Bonaparte claim successfully, and are raising a quantity of pay mineral. The Graphic Mining and Smelting Company are preparing to blow in their plant in this city in a few days. The Jane Bowman continues to be developed, and dumps mineral daily at the Hasse, Ott & Co. concentrator. The last run of the Jane Bowman concentrator, in Water Canyon, has proved exceedingly satisfactory to the owners. The Chloride mine, in the Pueblo district, continues to improve. Jim Barnes has made a remarkable strike of rich galena. The ore body is large, and he is dumping pay mineral in a lively way. A Radcliffe, superintendent of the L. V. & St. L. M. & S. Co., is putting the Ella James in nice trim. This is one of the largest lodes in the range. Alex Bentley, owner of the American Flag mine, and part proprietor of the successfully operated 60-ton Hermosa concentrator, is in Socorro with a shipment of concentrates, now being treated at the Billing works. The late run of the M. M. & M. Co.'s stamp-mill in this city resulted in the production of 15 silver bricks. One fact has been demonstrated by this treatment of the Merritt ore, that it has very materially improved in its silver value.

KINGSTON DISTRICT.—Albuquerque Journal, Oct. 6: One of the best exhibits at the fair was that shown by Mr. Fred Lindner, from the Kingston district. Mr. Vincent Wallace, the Kingston banker, collected the exhibit, and 20 mines were represented. The exhibit contained some of the richest ore ever

seen in the Territory. One specimen from the Kangaroo mine, a recent discovery, assays \$27,000 to the ton, and another from the Lady Franklin is valued at \$600. This mine is one of the richest in New Mexico, having since last December produced \$160,000, with a half million dollars worth of ore in sight. Notwithstanding the Indian troubles, the Kingston district is more prosperous this year than ever before. A dozen mining properties are producing and shipping ores, and with the extermination of the Apaches the camp would enjoy a genuine boom. Mr. Lindner has great faith in the future of Kingston, and is fully convinced that it is the richest mining district in New Mexico.

OREGON.

PROSPECTING.—Jacksonville Times, Oct. 10: Considerable prospecting is still being done in Jackson and Josephine counties. Miners are getting ready for winter, and anticipate a better mining season than usual. Mr. Elliott, of Baker county, arrived here Wednesday, and will prospect for quartz in this section. Ex-Governor Chadwick has been at Galice creek, looking after his interests in the Yank ledge. Work is progressing satisfactorily on the Sterling Co.'s huge reservoir, and it will be completed before long. Will Q. Brown and a mining expert from San Francisco, named Perkins, went down to Galice creek last week. Reub. Jones and J. T. Hays are extensively engaged in mining on Cow creek, Douglas county, and seem to be doing well. Eli Taylor, who returned from Josephine county last week, informs us that some parties from California are prospecting on Williams creek. The season for prospecting is about over, and before long those who have been roaming the mountains will have to come into the camps for the winter. Work continues on the long tunnel at the Yank ledge in Josephine county. The quality of rock taken out is reported as improving as the tunnel progresses. We are informed that some very rich prospects have been struck in quartz near the old Lucy Queen mine in Josephine county. Several claims have already been taken. Jas. G. Birdsey has let a contract for manufacturing 300 feet of hydraulic pipe for his mines on Birdsey creek. A great deal of work will be done there in case of a wet winter. It is rumored that J. Wimer & Sons and John Bolt now control the Sugar Pine quartz ledge on Galice creek, discovered by Green Bros. This is valuable property, and if such is the case it will be thoroughly developed. Arthur Wilson has discovered a bituminous coal mine on his farm near Medford. The vein is over four feet wide and is said to be inexhaustible. It resembles the coal of Toledo, Ohio. He proposes to develop the mine at once. Geo. H. Chick and his engineer are in the valley, and submitted a scheme to the citizens of Medford to put up a quartz mill, which is now in Siskiyou county, at that place, providing they would furnish him the necessary land and also purchase the five-eighths interest in said mill owned in California. A public meeting was held Tuesday evening to consider the matter, and Mr. C. informs us that his proposition was accepted. The mill will be brought over at once.

VIRTUE.—Bedrock Democrat, Oct. 9: Increased activity in mining matters is a harbinger of better times for this section. Capital from all parts of the United States is being brought here for investment, and mining properties that have long been dormant are being developed. Mr. Terry, the agent for Mr. Grayson, the principal owner of the Virtue mine, left this city Sunday, having made all the preliminary preparations for the resumption of work on the once famous and still valuable mining property, the Virtue. S. Ottenheimer, of this city, has taken the contract to deliver 300 cords of wood at the mill for \$5.50 per cord, and Thomas Moore, of the Pleasant valley saw-mill, has contracted to deliver 50,000 feet of lumber at the mill this fall. Mr. Terry contemplates returning in about three weeks, with all the machinery requisite for pumping out the works, and to sink on the old shaft that was abandoned at the time work was suspended a few years ago. The owners of this property are resuming work as though thoroughly confident of the permanency and richness of the ledge, and the valuable returns to be realized when the mine is worked as it should be—for the benefit of the owners, and not for outside individuals. It is not necessary to enumerate the benefits that will accrue to Baker City by reason of the work being renewed on this mine. It was the Virtue mine that nurtured Baker City in her infancy, and made her the town she is to-day, and when the mine again opens up with a large force of men, our sources of revenue will be largely augmented, our population increased and the business outlook will have a brighter future.

GRANITE CREEK.—Bedrock Democrat, Oct. 9: Granite Creek again comes to the front with another fine lot of bullion. Yesterday, in J. W. Virtue's banking house, we were shown 400 ounces of silver from the Caball mine in the Granite district. This is the second shipment this season, and another will follow later. The most favorable reports from the Malheur mine, owned by Wilson and Richardson, continue to come in. Mrs. Mary Richardson, who was in the city this week, enroute to San Francisco, reports the mine richer as it is developed. A large body of ore is in sight that will mill \$40 per ton. She takes to San Francisco some fine specimens showing free gold from the mine, and while there will probably make arrangements for a 10-stamp mill to be erected this fall or early in the spring.

UTAH.

AMERICAN FORK MINES.—Salt Lake Tribune, Oct. 6: The Silver Bell, Borussia and Queen of the West mines have fine ore ready for shipment and commence those shipments this week. The Miller and Pittsburg have been shipping, and are continuing shipments of good ore in fair quantities and profitable to the lessees and owners. The Deer Creek S. M. Co. and the Milk Maid lessees have been at work all summer on a strong vein of good ore and they have ore ready for shipment. Osborn of the American Fork G. & S. M. Co., has several men at work on the Flora and other mines. Mrs. Bredemeyer has good work performed on her mines and may expect something large and good at any day, for the vein on the Knight of Pythias and Oquirrh Encampment is three feet wide, showing well and so does the Queen of the West and several others. In fact the district will yet be again one of the leaders.

THE PACIFIC COAST ELECTRICAL CONSTRUCTION CO.

OFFERS FOR SALE

Keith's Dynamo-Electric Machines,
FOR ELECTRIC LIGHT AND POWER.

OFFICE—40 NEVADA BLOCK.

WORKS AT UNION IRON WORKS.

San Francisco, Cal.

The Power of Waterfalls can be Transmitted any Distance for use over or underground in any quantity. Electric Railways for Mines, Towns, and Branches.

Dynamos, Electric Motors, Storage Batteries, Arc Lamps, Incandescent Lamps, and all Appliances for Light, Power, and Metallurgy by means of Electricity. THE BEST LIGHT FOR MILLS AND MINES.

California Manufacturers and Government Contracts.

At a recent meeting of the Board of Directors of the Manufacturers' Association Secretary Hickox reported that he had sent to the Secretaries of the Treasury, Navy, War and Interior departments letters of which the following is a form:

"Under instruction of the Board of Directors I have the honor of addressing you upon the inequality arising from the custom of advertising many of the Government contracts in the East. Removed several days transit from the capital, the people of this coast are thereby at a disadvantage in that the time required in transmitting information here of Government requisitions and returning proposals materially reduces to us the period for making bids, and in some cases has prohibited our competition. It is believed if this disparity is removed by simultaneous publication of such information here with the East that a considerable portion of our products and manufactures will be furnished upon acceptable terms, enlarging the field of competition favorably to the respective departments under your control, while affording more equal conditions to the people of this coast with citizens of other States nearer the seat of Government. Earnestly asking your consideration of the matter and official adoption of such means as will accomplish the purpose, we hope to await your action. Very respectfully,

Geo. C. Hickox, Secretary.

The Replies.

The Secretary stated that he had already received replies from Secretary Manning and Secretary Whitney, and also from the Ordnance Bureau of the Navy Department. The letters evinced a hearty spirit of fairness, and showed that now the subject had been called to the attention of the departments, hereafter California manufacturers and merchants would receive just attention. The letter from Secretary Whitney was as follows:

NAVY DEPARTMENT,

WASHINGTON, September 26, 1885.

Sir:—Your letter of the 4th instant, calling the department's attention to the inequalities existing from the custom of advertising many of the Government contracts only at the East has been received. You are informed, in reply, that the matter has been referred to the bureaus, with instructions that slips showing articles for which proposals may be invited will be sent to the firms comprising your association, so far as found reasonable and judicious. Very respectfully,

W. C. WHITNEY,
Secretary of the Navy.

Treasury Department.

Secretary Manning wrote as follows:

George C. Hickox—Sir:—I have received your letter of the 4th instant, in regard to advertising the needs of the Government on the Pacific Coast. In reply, I have to say that the advertisements of this department soliciting proposals are generally placed in papers published in the locality directly interested. Your letter, however, has been placed on file, and will receive additional consideration. Yours respectfully,

D. MANNING, Secretary.

War Department.

H. L. Muldrew, Acting Secretary of the War Department, replies as follows:

George C. Hickox, Secretary of the Manufacturers' Association.—Sir:—I acknowledge the receipt of your letter of the 5th inst., in which you invite the attention to the disadvantages to the people of the Pacific Coast, arising from the custom of advertising for proposals for supplies for the Government only in newspapers published in the East, and in reply have to state that the matter will receive due attention by this department in ordering such advertisements hereafter as may be deemed to be of interest to the merchants and manufacturers of California. Very respectfully,

H. L. MULDREW,
Acting Secretary.

Ordnance Bureau.

Thad. K. Sailer, of the Ordnance Bureau, wrote the following:

"Please send to this bureau a list of the members of the Manufacturers' Association of California, in order that information may be sent to each firm when occasion arises to purchase articles."

Secretary Hickox is also in receipt of several proposals for bids from the Navy Department, which are to be opened on October 15th. They are at his office in the Merchants' Exchange.

A committee was appointed to secure more favorably situated rooms for the association, the intention being to secure some place centrally located, where members can conveniently drop in at all times.

Bullion Shipments.

EXPLANATION.—Cl, for clear; Cy, cloudy; Fr, fair; Fy, foggy; — indicates too small to measure. Temperature wind and weather at 12:00 M. (Pacific Standard time), with amount of rainfall in the preceding 24 hours.

Mining Share Market.

The long promised bonanza in the middle mines of the Comstock has not yet appeared, although the indications are claimed as good; in fact the Virginia Enterprise states that none of the famous bonanzas which have heretofore been opened in any portion of the Comstock had any better indications than are now shown in the Hale and Norcross and Chollar. The great body and strength of ledge is there, with strong mineralization; the "blossoms" and all other prerequisites are there, and the fruit is now what is wanted. Offshoots and branches from the main ore vein have been more and more plentifully encountered in the progress of development, and the natural sequence sought is the concentration into the grand ore deposit. Quite a number of men have been put to work in Crown Point and Belcher, preparing for taking out plenty of ore when the Carson river will raise up and give the requisite motive power to the mills. Good work is being done opening out the old upper workings of the Ophir at a point where large quantities of ore are known to exist, which were passed by in the early times when expenses were heavier than now, and with the present greatly improved facilities for extraction, transportation and milling, it is expected that these long-neglected ore resources will be made available to good advantage and profit. There was talk of Mr. Fair trying to get control of Con. California and Virginia stock, but he took no part in the election after all.

New Incorporations.

The following companies have been incorporated and papers filed in the office of the Superior Court, Department of San Francisco.

WIDE AWAKE MINING CO.—Oct. 8th. Location Sierra Co., Cal. Capital stock, \$24,000 or 24,000 shares. Directors—W. Hansen, L. Nessler, F. Busch, H. T. Briggs and Thomas Calless, all of Downieville.

CASCADE OIL CO.—Oct. 8. Capital stock \$1,000,000. Directors—James A. Johnson, R. R. Provines, C. Livingston, Wm. M. Gwin and F. G. Newlands.

CO-OPERATIVE BRICK TILE AND TERRA COTTA ASSOCIATION.—Oct. 8. Capital stock \$25,000. Object: Buying suitable land and erecting machinery for the manufacture of bricks, drain tiles, sewer pipe, terra cotta ware, and all articles of earthenware. Directors—Roderick A. Gilbride, James E. Clashy, Aaron Evans, James J. Martin and James K. Phillips.

List of U. S. Patents for Pacific Coast Inventors.

From the official list of U. S. Patents in DEWEY & CO.'S SCIENTIFIC PRESS PATENT AGENCY, 252 Market St., S. F.

FOR WEEK ENDING OF OCTOBER 6, 1885.

- 327,664.—MACHINE FOR CUTTING CORN FROM THE COB.—Benj. Collins, Oakland, Cal.
327,529.—BUCK POLE.—B. F. Cook, Santa Maria, Cal.
327,681.—COTTON CHOPPER ATTACHMENT FOR CULTIVATORS.—H. Hennickson, Duarte, Cal.
327,683.—CULTIVATOR AND WEED CUTTER.—L. B. Hogue, Carpinteria, Cal.
327,690.—ELEVATED ELECTRIC RAILWAY.—Andrew Jackson, S. F.
327,693.—GRAPE STEMMER AND CRUSHER.—Johnson & Smith, S. F.
327,698.—MUSIC LEAF TURNER.—C. H. Lindemann, S. F.
327,724.—TUNE FORMING MACHINE.—J. L. Richter, S. F.
327,707.—APPARATUS FOR MINING RIVER BEDS, ETC.—J. R. Moffitt, Chinese Camp, Cal.
327,708.—WET ORE CONCENTRATOR.—J. R. Moffitt, Chinese Camp, Cal.
327,709.—RETORT AND CRUCIBLE FURNACE.—J. R. Moffitt, Chinese Camp, Cal.
327,710.—HEEL-STIFFENER MACHINE.—J. R. Moffitt, Chinese Camp, Cal.
327,735.—SEPARATOR.—Linus Stewart, S. F.
327,742.—MACHINE FOR MAKING NUTS.—S. Uren, Sacramento, Cal.
327,743.—UTILIZING SCRAP FOR NUTS, ETC.—S. Uren, Sacramento, Cal.
327,640.—SULKY PLOW.—J. T. Ziegler, Santa Cruz, Cal.

NOTE.—Copies of U. S. and Foreign patents furnished by Dewey & Co., in the shortest time possible (by telegraph or otherwise), at the lowest rates. American and Foreign patents obtained, and all patent business for Pacific Coast inventors transacted with perfect security and in the shortest possible time.

Notices of Recent Patents.

Among the patents recently obtained through Dewey & Co.'s SCIENTIFIC PRESS U. S. and Foreign Patent Agency, the following are worthy of special mention:

FOLDING BED.—B. F. Farrar, S. F. No. 327,076. Dated Sept. 29, 1885. This folding bed consists of a sectional mattress or bed, the sections of which are hinged together, of movable supporting frames or legs, to which the sections of the mattress are pivoted, of a hinged head board, of certain braces, stops, latches and fastenings, and of a suitable cover for the whole.

CHECK REIN AND POST HOOK.—C. L. Bard, San Buenaventura, No. 327,057, dated Sept. 29, 1885. The invention consists in a slotted check-rein attached in front to the head-gear, which may be the overdraw or gag-check, and having a rear extension attached to the driving lines at a point behind the plane of the pad, and a post upon the pad through which the check-rein passes, said post having a fixed hook adapted to engage the slot of the check-rein.

SULKY PLOW.—John T. Ziegler, Santa Cruz, No. 327,640. Dated Oct. 6, 1885. This sully plow consists of two or more plows upon opposite sides of a beam, a means by which said beam may be rotated and held with either of the plows or sets of plows in action, and a means by which the wheel axle can be rotated so as to throw either wheel downward to make it a furrow wheel when the plows are working to that side.

GAS LAMP.—Leopold Julig, S. F. No. 327,089. Dated Sept. 29, 1885. This gas or vapor lamp consists in an oil reservoir having an outer chamber, to which the oil is fed, and an inner chamber communicating with the outer one. A peculiar burner communicating with the outer chamber, a rotating fan within the inner chamber above the oil, and operated by an electric current, a valved port communicating with the inner chamber, whereby air is drawn in by the fan, and in various details of construction. The object is to provide an effective lamp for burning the gases or vapors originating from gasoline and other liquid hydrocarbons.

CHECK-REIN AND POST HOOK.—C. L. Bard, San Buenaventura. No. 327,056. This is a slotted check-rein, connected at its front to either the ordinary overdrawn or gag check-rein, and having a rear extension attached at a point behind the plane of the pad; and in a peculiar post on the pad through which the check-rein passes, said post having a pivoted hook-lever, the forward point of which is adapted to engage the slot of the check-rein, and its rear end to receive said rein, which passes through it. One object of this arrangement is to enable the driver to check and uncheck his horses at will without being obliged to step out of the vehicle. He can water his horses in a stream or at a trough without leaving the vehicle. In ascending hills or going over rough portions of the roads, where it is desirable to give the horse his head, he can do so with very little exertion. The driver has, with this device, greater control over his horses.

GRAPE STEMMER AND CRUSHER.—Geo. Johnston, S. F., and Edwin G. Smith, Sacramento. No. 327,693. Dated October 6, 1885. This apparatus consists of an approximately horizontal case, in one end of which the bunches of grapes are delivered, a series of revolving arms or heaters fixed upon a shaft which extends through the case, and a series of angular ad-

justable or stationary spirals or guides fixed within the case, by which the stems are caused to pass out of the opposite end of the case after being separated from the grapes; a chute through which the separated grapes are delivered to the peculiarly constructed rollers, and in an inclined revolving and perforated drum or cylinder, within which the pulp and juice are finally separated.

TUNE FORMING MACHINE. John L. Richter, S. F. assignor to W. W. Montague. No. 327,721. Dated Oct. 6, 1885. This is an apparatus for rolling metal tubes. It consists in a rotating traveling roller, moving over the metal sheet within fixed guides, and having a peculiar clamp for securing the edge of the sheet.

SEPARATOR. Linus Stewart, S. F. No. 327,735. Dated October 6, 1885. This invention relates to the class of boilers, and it consists in a plate or shield within the boiler and directly below the entrance of the exit steam pipe. When this water in a boiler is foaming and steam is being drawn from it by a pipe which is simply put in the boiler, the rush of steam toward the exit is such that the water rises or lifts, being highest in its center, and the steam is necessarily drawn out in a wet condition; but by having the shield here patented this lifting of the water in the vicinity of this exit pipe is prevented, and none but dry steam is taken out, because of the protection afforded the entrance of the pipe.

ELEVATED ELECTRIC RAILWAY.—Andrew Jackson, S. F., assignor of one half to John K. Savags, No. 327,690. Dated Oct. 6, 1885. The object of this electric railway is to transport rapidly a small car or receptacle designed to contain small packages and other minor freight. It consists of an electric track, a car or receptacle containing an electric motor and suspended from said track by a suitable wheel adapted to travel thereon, suitably suspended and insulated continuous wires, a means for taking the current from said wires to the electric motor in the car, and a mechanism for transmitting the power of said motor to propel the suspending wheel of the car or receptacle. Certain novel details of construction are covered by the patent.

MUSIC LEAF TURNER.—Chas. Lindemann, S. F., No. 327,698. Dated Oct. 6, 1885. This device for turning the leaves or pages of books or music consists of certain improvements in that class of turning appliances in which a series of arms extend outward between the leaves of the sheet to be turned, and are actuated by short racks which engage the teeth of pinions formed upon the inner ends or journals of these arms. The object is to provide a means for turning leaves in one direction by means of a pedal or foot lever at the bottom of the music stand, while the leaves may be returned by means of a second or releasing lever which allows the spring to act and so turn the pages backward. It also consists of a means by which the music rack may be raised or lowered to suit persons of different heights, or in different positions, without interfering with the turning mechanism.

Our Agents.

OUR FRIENDS can do much in aid of our paper and the cause of practical knowledge and science, by assisting Agents in their labors of canvassing, by lending their influence and encouraging favors. We intend to send none but worthy men.

JARRE C. HOAG—California.
J. J. BARTLEY—Sacramento and San Joaquin.
A. C. KNOX—Nevada (State).
G. W. INGALLS—Arizona.
E. L. RICHARDS—Los Angeles and San Bernardino.
R. G. HUSTON—Idaho and Montana.
Geo. McDOWELL—Tulare and Fresno Co's.
HUGH ELIAS—Nevada Co.
J. DE PUE, Colusa and Butte Co's.
R. E. LLOYD, Contra Costa and Stanislaus.
J. WINKLER, Alameda Co.

Easy Binder.

Dewey's patent elastic binder, for periodicals, music and other printed sheets, is the handiest, best and cheapest of all economical and practical file holders. Newspapers are quickly placed in it and held neatly as in a cloth-bound book. It is durable and so simple a child can use it. Price, size of Mining and Scientific Press, Rural Press, Watchman, Fraternal Record, Masonic Record, Harper's Weekly, and Scientific American, 75 cents; postage, 10 cents. Postpaid to subscribers of this paper, 50 cents. Send for illustrated circular. Agents wanted.

Lost Papers.

If any subscriber fails to receive this paper promptly after making due inquiries at the Postoffice, he is urgently requested to notify this office by letter, that we may send the missing papers, and, if possible, guard against further irregularities.

CELEBRATED tourists' glasses only at Muller's, 135 Montgomery street, near Bush, opposite Occidental Hotel.

NEW BOOKS ON ASSAYING.

BY C. H. AARON.

PART I.—Gold and Silver Ores.—Price \$1.

This new work is written by an experienced metallurgist who has devoted many years to assaying and working precious ores on the Pacific side of the American Continent. He writes whereof by knows from personal practice, and in such plain and comprehensive terms that neither the scientist or the practical miner can mistake his meaning. The work, like Mr. Aaron's former publications "Testing and Working Gold and Silver Ores," "Leaching Gold and Silver Ores," "That have been 'unsuccessfully' in assay" is written in a condensed form, which renders his information more readily available than that of more wordy and less conscientious writers. The want of such a work has long been felt. It will be very desirable in the hands of many.

Table of Contents:

Preface; Introduction; Implements; Assay Balance; Materials; The Assay Office; Preparation of the Ore; Weighing the Charge; Mixing and Charging; Assay Litharge; Systems of the Crucible Assay; Preliminary Assay; Dressing the Crucible Assay; Examples of Dressing; The Melting in Crucibles; Scorchification; Cupellation; Weighing the Button; Parting; Calculating the Assay; Assay of Ore Containing Coarse Metal; Assay of Roasted Ore for Solubility; To Assay a Copied; Assay by Amalgamation; To Find the Value of a Specimen; Test for Oxygen; A Few Special Minerals; Solubility of Metals; Substitutes and Expedients; Assay Tables.
The volume embraces 106 1/2 pages, with illustrations, well bound in cloth 1884. Price, \$1, postpaid. Sold by DEWEY & CO., Publishers, No. 252 Market Street, San Francisco.

PARTS II AND III.

Lead, Copper, Tin, Mercury, etc.

Price \$1.75.

This book is entitled "Assaying—Parts II and III," and is separate from Part I, and treats of Gold and Silver Bullion, Lead, Copper, Tin, Mercury, Zinc, Nickel, Cobalt, etc.

Table of Contents:

Gold and Silver Bullion; Apparatus; Melting Bullion; Assaying Bullion; Manual Assay of Silver; Manipulation, etc.; Lead Ores; Copper Ores; Volumetric Assays; Parkes' Process; Amalgamation; New Process; Preparation of Potassium Zanthate; Electrolytic Determination of Copper in Ores, etc.; Assaying of Tin Ores; Assaying of Mercury Ores; Assaying of Zinc Ores; Assaying of Zinc Ores, New Method; New Assay of Nickel and Cobalt; Assay of Chromium; Assay of Bismuth; Assay of Arsenic; Assay of Antimony; Assay of Sulphur; Assay of Salt; Appendix to Part I; Notes on Crucible Assay; Weighing by Oscillations; Appendix to Part III; The Assay of Lead; The Assay of Copper.

There are 168 1/2 pages, with illustrations in the volume, which is bound strongly in cloth. Price postpaid, \$1.75. Sold by DEWEY & CO., Publishers, No. 252 Market St., S. F. These are much needed books for miners and other practical men, by an intelligent miner and assayer and careful writer. They are invaluable for the mill and mine worker, and equally good for scientific experts. They are thoroughly practical books.

Don't Fail to Write.

Should this paper be received by any subscriber who does not want it, or beyond the time he intends to pay for it, let him not fail to write us direct to stop it. A postal card (costing one cent only) will suffice. We will not knowingly send the paper to anyone who does not wish it, but if it is continued, through the failure of the subscriber to notify us to discontinue it, or some irresponsible party requested to stop it, we shall positively demand payment for the time it is sent. LOOK CAREFULLY AT THE LABEL ON YOUR PAPER.

ASSESSMENT NOTICE.

Orleans Mining Company.—Location of

principal place of business, San Francisco, California. Location of works, Grass Valley, Nevada county, Cal. NOTICE is hereby given, that at a meeting of the Directors, held on the 17th day of September, 1885, an Assessment (No. 12) of Five (5) Dollars per share was levied upon the capital stock of the corporation, payable immediately in United States gold coin, to the Secretary at the office of the Company, 934 and 936 Mission street, San Francisco, Cal. Any stock upon which this Assessment shall remain unpaid on the second day of November, 1885, will be delinquent, and advertised for sale at public auction; and unless payment is made before, will be sold on Monday the twenty-third day of November, 1885, to pay the Delinquent Assessment, together with costs of advertising and expenses of sale.

GEORGE P. THURSTON, Secretary.
OFFICE—934 and 936 Mission St., San Francisco, Cal.

METALLURGIST.

Send for Circular.

Dewey & Co., American and Foreign Patent Agents.

PATENTS obtained promptly; Caveats filed expeditiously; Patent Reissues taken out; Assignments made and recorded in legal form; Copies of Patents and Assignments procured; Examinations of Patents made here and at Washington; Examinations made of Assignments recorded in Washington; Examinations ordered and reported by Telegraph; Rejected cases taken up and Patents obtained; Interferences Prosecuted; Opinions rendered regarding the validity of Patents and Assignments; Every legitimate branch of Patent Soliciting promptly and thoroughly conducted.

Our intimate knowledge of the various inventions of this coast, and long practice in patent business, enable us to abundantly satisfy our patrons; and our success and business are constantly increasing.

The shrewdest and most experienced inventors are found among our most steadfast friends and patrons, who fully appreciate our advantages in bringing valuable inventions to the notice of the public through the columns of our widely circulated, first-class journals—thereby facilitating their introduction, sale and popularity.

Foreign Patents.

In addition to American Patents, we secure with the assistance of co-operative agents, claims in all foreign countries which grant Patents, including Great Britain, France, Belgium, Prussia, Austria, Baden, Peru, Russia, Spain, British India, Saxony, British Columbia, Canada, Norway, Sweden, Mexico, Victoria, Brazil, Bavaria, Holland, Denmark, Italy, Portugal, Cuba, Roman States, Wurtemberg, New Zealand, New South Wales, Queensland, Tasmania, Brazil, New Granada, Chile, Argentine Republic, AND EVERY COUNTRY IN THE WORLD where Patents are obtainable.

No models are required in European countries, but the drawings and specifications should be prepared with thoroughness, by able persons who are familiar with the requirements and changes of foreign patent laws—agents who are reliable and thoroughly established.

Our schedule price for obtaining foreign patents, in all cases, will always be as low, and in some instances lower, than those of any other responsible agency.

We can and do get foreign patents for inventors in the Pacific States from two to six months (according to the location of the country) SOONER than other agents.

The principal portion of the patent business of this coast has been done, and is still being done, through our agency. We are familiar with, and have full records, of all former cases, and can more correctly judge of the value and patentability of most inventions discovered here than any other agents.

Situated so remote from this seat of Government, delays are even more dangerous to the inventors of the Pacific Coast than to applicants in the Eastern States. Valuable patents may be lost by extra time consumed in transmitting specifications from Eastern agencies back to this coast for the signature of the inventor.

Confidential.

We take great pains to preserve secrecy in all confidential matters, and applicants for patents can rest assured that their communications and business transactions will be held strictly confidential by us. Circulars of information to inventors, free.

Home Counsel.

Our long experience in obtaining patents for inventors on this Coast has familiarized us with the character of most of the inventions already patented; hence we are frequently able to save our patrons the cost of a fruitless application by pointing to them the same thing already covered by a patent. We are always free to advise applicants of any knowledge we have of previous applicants which will interfere with their obtaining a patent.

We invite the acquaintances of all parties connected with inventions and patent right business, believing that the mutual conference of legitimate business and professional men is mutual gain. Parties in doubt in regard to their rights as assignees of patents or purchasers of patented articles, can often receive advice of importance to them from a short call at our office.

Remittances of money, made by individual inventors to the Government, sometimes mis-carry, and it has repeatedly happened that applicants have not only lost their money, but their inventions also, from this cause and consequent delay. We hold ourselves responsible for all fees intrusted to our agency.

Engravings.

We have superior artists in our employ, and all facilities for producing fine and satisfactory illustrations of inventions and machinery, for newspaper, book, circular and other printed illustrations, and are always ready to assist patrons in bringing their valuable discoveries into practical and profitable use.

THE ROLLER ORE FEEDER

[Patented May 28, 1882.]

This is the best and cheapest Ore Feeder now in use.
It has fewer parts, requires less power, is simpler in
adjustment than any other. Feeds coarse ore or soft clay
alike uniformly, under one or all the stamps in a battery
as required.

In the Bunker Hill Mill it has run continuously for two
years, never having been out of order or costing a dollar
or repairs.

HOOD'S FOUNDRY COKE.

Consumers are respectfully informed that owing to inferior brands of Coke having been sold
in this and other countries under the name of "Patent Coke," the Glamorgan Coal Co.
(Limited), Cardiff, in May, 1884, abandoned the title of "Patent Foundry Coke," substituting
that of "Hood's Foundry Coke."

This Coke is exclusively used by the Selby Smelting and Lead Co., Union Iron Works,
Professor Thomas Price, and other consumers here. Large quantities are regularly forwarded
to Copper Smelters in Arizona and New Mexico, and also to consumers in Nevada and Salt Lake.
The undersigned are the SOLE IMPORTERS of the above Coke, which is for sale in quanti-
ties to suit purchasers.

BALFOUR, GUTHRIE & CO.,

316 California St., San Francisco.

F. A. HUNTINGTON'S CENTRIFUGAL ROLLER QUARTZ MILL.

Economy in Expense of Plant. Economy in Cost of Working. Economy
in Saving Gold. Economy in Transportation of Machinery.
Economy in Cost of Erection of Mill at Mine. Econ-
omy in Time Required to Establish Plant
(one day only being consumed).

The Huntington Mill has passed entirely through the experimental stage. Two years of
continuous use at a number of mines in California has enabled the inventor to perfect and im-
prove the machinery until he feels justified in assuring the public that he has reached THE ABSO-
LUTE in the construction of a perfect Quartz Mill.

IMPROVED FORM OF HYDRAULIC GIANTS.

The above cut illustrates the IMPROVED FORM OF HYDRAULIC GIANTS, which we manu-
facture. All similar styles are infringements upon this form, and a judgment stands of record to that effect, under
the decision of Judge Sawyer of the U. S. Circuit Court in the matter of Hendy and Fisher vs. R. Hoskin et al.
ESTD 1870 Prices furnished upon application to

JOSHUA HENDY MACHINE WORKS,

39 to 51 Fremont St., San Francisco, Cal.

This cut represents our

IMPROVED
HYDRAULIC
MACHINE.

IT DIFFERS FROM THE OLD STYLE IN HAVING ONLY ONE JOINT
instead of two. It is of greater capacity and more easily worked and
kept in repair. The statement of Mr. Hendy that all styles are infringements
on the machines made by him, he knows to be utterly false. All
litigation has been in reference to old style two jointed machines, which
are superseded by our new style one jointed. The decision of Judge
Sawyer, referred to by him, is carried up on appeal to U. S. Supreme
Court, with absolute certainty of a reversal in our favor. **ESTD 1870** Send for

THE ORIGINAL Roller Ore Feeder.

(PATENTED JUNE 24, 1873.)

This form of Ore Feeder is well adapted for its peculiar
work. Manufacturers of the Celebrated "Chal-
lenge" Ore Feeders for any character of
ores; also "Stanford Improved" Ore
Feeders and Tullock's Ore Feeders for
dry ores.

ESTD 1870 Prices furnished upon application to

JOSHUA HENDY MACHINE WORKS,

39 to 51 Fremont St., San Francisco.

DRY WASHER for PLACERS

THE HITCHCOCK & HERSHEY
NEW DRY GOLD CONCENTRATOR.

This Machine weighs only 325 pounds; readily taken
apart; packs in small compass; may be run by hand or
horse power. Capacity, two tons an hour. No blowers
or 6x1 fans, or quicksilver used. Frame all malleable
iron. Will save a higher percentage of gold than other
machines. TATUM & BOWEN, San Francisco
and Portland, Agents.
Now on exhibition at Mechanics' Fair,
San Francisco, where it may be seen in operation.

\$1,000 CHALLENGE!

**THE FRUE ORE CONCENTRATOR,
OR VANNING MACHINE.**

**PRICE: FIVE HUNDRED AND SEVENTY-FIVE DOLLARS,
(\$575 00), F. O. B.**

OVER 1,000 ARE NOW IN USE. Saves from 40 to 100 per cent more than any other Concentrator. Concentrations are clean from the first working. The wear and tear are merely nominal. A machine can be seen in working order and ready to make tests at the Fulton Iron Works, No. 230 Fremont Street, San Francisco.

As the result of a suit East against an End-Shake Machine (the Embrey), similar to the Triumph, the Frue Vanning Machine Company owns the Embrey patent, and can put in the market an End-Shake Machine of earlier patent that will do as good work as the Triumph, and superior in construction and durability. There will be no risk of suit for infringement.

The Frue Vanning Machine Company warn the public that they claim and will prove the Triumph machine to be an infringement on patents owned by them.

Protected by patents May 4, 1869, Dec. 22 1874, Sept. 2, 1879, April 27, 1880, March 22, 1881, Feb. 20, 1883, Sept. 18, 1883. Patents applied for.

N. B.—We are and have been ready at any time to make a competitive trial against the Triumph, or any other Concentrator for stakes of \$1,000.

....BUILDERS OF....

MINING MACHINERY.

San Francisco: 127 First Street. Chicago: 100 N. Clinton. New York: 145 Broadway.

PLANTS FOR GOLD AND SILVER MILLS, embracing machinery of LATEST DESIGN and MOST IMPROVED construction. We offer our customers the BEST RESULTS OF 35 YEARS' EXPERIENCE in this SPECIAL LINE of work, and are PREPARED to furnish from SAN FRANCISCO or CHICAGO, the MOST APPROVED character of MINING AND REDUCTION MACHINERY, adapted to all grades of ores and SUPERIOR to that of any other make, at the LOWEST POSSIBLE PRICES.

We are also prepared to CONSTRUCT and DELIVER in COMPLETE RUNNING ORDER, in any locality, MILLS, CONCENTRATION WORKS, WATER JACKET SMELTING FURNACES, HOISTING WORKS, PUMPING MACHINERY, ETC., ETC., of any DESIRED CAPACITY.

WATER JACKET SMELTING FURNACES

For COPPER and ARGENTIFEROUS LEAD ores of NEW and ORIGINAL DESIGNS, covered by LETTERS PATENT. No other Furnace CAN COMPARE with these for DURABILITY, and in CAPACITY for uninterrupted work. MORE THAN 150 of them are now RUNNING in various parts of THIS COUNTRY, as well as many in FOREIGN COUNTRIES, giving results NEVER BEFORE ATTAINED as regards CONTINUOUS running, ECONOMY of fuel, AMOUNT and QUALITY of BULLION produced. These CLAIMS have been PROVEN BY RESULTS in ANY NUMBER of INSTANCES, and the GREAT SUPERIORITY of this SYSTEM of smelting ores DEMONSTRATED BEYOND QUESTION. COMPLETE PLANTS furnished to order of any CAPACITY, with ALL IMPROVEMENTS that experience has DEMONSTRATED as VALUABLE in this class of work.

Beyond question the cheapest and most effective machine of the kind now in use adapted to all grades and classes of ores.

This machine has been THOROUGHLY TESTED for the past TWO YEARS, under a GREAT VARIETY of CONDITIONS, giving most EXTRAORDINARY results FAR IN ADVANCE of anything EVER BEFORE REALIZED. A recent COMPETITIVE TEST at the Carlisle Mine in Mexico, showed an ADVANTAGE OF OVER 30 PER CENT in favor of THE DUNCAN. The amount SAVED OVER THE FRUE being sufficient to PAY THE ENTIRE COST of the machines EVERY MONTH OF THE YEAR. One of its MOST VALUABLE features is as an AMALGAMATOR. It saves all THE AMALGAM GOLD and SILVER that ESCAPES THE BATTERIES, PANS or SETTLERS, making the machine worth MORE than ITS COST for THIS PURPOSE ALONE.

Baker's Mining Horse Power.

Possessing all the requirements of a first-class hoist, and affording means for the continuous operation of a Pump or Blower, without interfering with a hoisting apparatus. It is made entirely of iron, no piece weighs over 300 pounds. At the ordinary speed of a horse, a 1,000-pound bucket of ore may be raised 120 feet per minute. The hoisting-drum is under the complete control of the man of the shaft, and is capable of carrying 600 feet of five-eighths steel rope. SEND FOR CIRCULAR.

**JENKINS PATENT VALVES.****Gate, Globe, Angle, Check and Safety.**

Manufactured of BEST STEAM METAL. We claim the following advantages over
other Valves and Gauge Cocks now in use:

1. A perfectly tight Valve under any and all pressures of steam, oils or gases.
2. Sand or grit of any kind will not injure the seat.
3. You do not have to take them off to repair them.
4. They can be repaired by any mechanic in a few minutes.
5. The elasticity of the Disc allows it to adapt itself to an imperfect surface.

In Valves having ground or metal seats, should sand or grit get upon the seat it is impos-
sible to make them tight except by regrinding, which is expensive if done by hand, and if don-
by machine soon wears out the valve, and in most cases they have to be dis- connected from
the pipes, often costing more than a new valve. The JENKINS Disc used in these Valves is
manufactured under our 1880 Patent, and will stand 200 lbs. steam. Sample orders solicited.
To avoid imposition, see that Valves are stamped "Jenkins Bros." For sale by

An Efficient Mining Pump.

The Alaska Mining Company, whose quartz mine is in Sierra county, in this State, has issued a very complete and well-printed report, showing the result of work at the mine for the past year. The mine has produced in 11 months \$175,456, of which 94,761, or 46 per cent of the gross product, has been paid or placed to the credit of shareholders. 8 per cent on the total capitalization. The cost of mining is \$5.70 per ton, and of milling \$6.64 per ton. The mine has been systematically opened, equipped and supplied and its value made apparent. A year ago they had three temporary pumps at work removing the water that had flooded the mine for a long time. After the shaft was cleared to the fifth level it was determined that permanent pumping machinery should be placed in the mine. In June last the flow was at the rate of 550 to 600 gallons per minute, which has recently increased to over 1000 gallons per minute, or over 1,400,000 gallons in 24 hours. The registering box gives 80 miners' inches under a six-inch head and 100 inches legal standard under four-inch head. Most mines, with an equal flow of water, would either have been abandoned or an expensive plant of pumping machinery costing, with foundation and freight, from \$100,000 to \$150,000, would have been provided.

To successfully run the mine until its earnings should so equip it was impossible, and plans must be varied or other means tried; so, after thorough investigation, the Worthington Compound Duplex mine pumping engine 18½ in. x 29 in. x 12 in. x 18 in. was selected from its long tested merits in other capacities, while comparatively new in its adaptation to this severe form of service. An engraving of this pump, taken from the official report, is shown on this page. An order was early given for its special manufacture, to be of 1,000,000 gallons daily capacity, at lowest speed, giving measurements of shafts, that no part should fail of admission to the mine. Its weight, with connections, is 15 tons. Its cost, including freight, fittings and setting, has been only \$12,650. Over 1200 tons rock was excavated for its room and reservoir. This pumping engine is placed at the 5th level of the mine, and now throws the entire volume

of water, at single lift, through a 12-inch column 400 feet, to the drain tunnel, and is capable of much greater service, if required, by accelerating its speed. Steam is conveyed to it through a 5-inch pipe 500 feet from the boilers. Steam pipe is thoroughly wrapped with hair felting encased in canvas, and the loss of steam by condensation is insignificant, steam gauge at pumping engine registering same as surface. The water from the upper levels is conveyed through wooden boxes to reservoir at 5th level, supplying in its passage an automatic steam condenser, constructed by Mr. J. H. Barker,

supplying four direct-acting steam pumps to free mine of water and two 10 in. x 20 in. hoisting engines, raising 75 to 80 tons ore and waste daily was 17 cords in 24 hours; quality, pine and spruce. In June with Worthington pump and same duty, fuel consumed eight cords daily. With additional increase since of 400 gallons per minute, consumption has increased to 11 cords daily. In the former case three firemen were employed in 24 hours; now two persons perform the labor.

Of the Worthington mine pumping engine, after three months severest test, as compared

The Crescent Mine.

At the annual meeting of the Crescent Mining Co., in Salt Lake City, the Michigan men kept the control and elected themselves directors and officers. This Utah mine is making a good record as a bullion producer. The concentrator and sampling mill have been doing good work. In the sampling mill all the shipping ore of the company has been sampled satisfactorily, both to the company and to purchasers, and it has saved to the company during the year \$6825. The books of the company show that 986 tons

of concentrates have been sold during the year, with a net profit of \$4,021. There have been extracted and sold during the year 11,581 tons of ore, which netted to the company at Park City \$199,413. The grade of ore during the year has averaged about the same in lead, but slightly less in silver. The amount produced has been 1203 tons less than last year the time being 11 months instead of 12, owing to the time of the annual meeting being changed from November to October. During the past six months the price of silver has been greatly depreciated, but the price of lead has been better than during the former year.

The company this year brought water from the springs to the

mine, thus saving \$200 a month. The locomotive for hauling the ore works successfully, and with the additional cars furnished will no doubt provide for the transportation of the second-class ore that is capable of being reduced by the concentrator. The Etna tunnel has been extended until connection was made with the old works on the east side of the hill, thus furnishing air for the tunnel and relieving the mine from the expense of fans. Some drifting has been done east and west upon said tunnel with satisfactory results. As for the general run of ore avails of sales have been about \$17.18 per ton, and from other sources, as above enumerated, \$3.09, a total of \$20.27. The total disbursements for all purposes have been about \$12.21 per ton. Net over all, which represents the amount paid on former indebtedness, dividend No. 5 and improvements, \$8.06 per ton.

MONTANA'S silver production during 1884 was about \$8,000,000; gold, \$2,000,000.

THE WORTHINGTON PUMP IN LEVEL NO. 5, ALASKA MINE, SIERRA COUNTY, CAL.

machinist and chief engineer at the mine, which assists the engine with vacuum pressure, registering 23 inches; at same time water is utilized for air blast to ventilate the mine, thus dispensing with fan machinery.

The three ordinary direct-acting steam pumps, formerly in use, have been placed respectively at 3d, 4th and 5th levels, to be used as relief to large pump in case of stoppage to change valves, or for any other cause, which would be equally necessary with any other pumping system. Until the last large increase of water, they have been of sufficient capacity to furnish such relief. Now, the one at No. 3 level, by actual test, at very high speed, is found sufficient; but due precaution and necessity requires another of equal or greater power to be placed immediately at No. 5, to throw the water to No. 3 pump, and one has been ordered, as the two smaller ones in use would be quickly overpowered in case of emergency. By actual measurement, wood consumption in month of May last, with two pair boilers, 54 in. x 16 ft.

with other form of steam pumps or Cornish plant the officers of the company have tested, and are prepared to say that the service it renders, the durability its mechanism ensures, the economy of its use and the comparatively small cost of its plant, the Worthington stands unrivalled and incomparable.

SILICON SHIPMENT.—Four carloads, containing 50 tons of silicon from J. S. Noe's mine, north of this city, says the *Virginia Enterprise*, have been shipped during the past week: two to San Francisco and one to New York, making 500 tons shipped thus far during the present year. It is used in the manufacture of asbestos preparations, and the deposit is inexhaustible.

The issue of standard dollars from the mints during the week ending Oct. 17th was \$1,029,750, and during the corresponding period of last year, \$594,997. The shipment of fractional silver coin from Oct. 1st to Oct. 17th amounted to \$567,559.

CORRESPONDENCE.

We admit, unendorsed, opinions of correspondents.—Eds.

The Russell Leaching Process.

A Glance at Mr. Stetefeldt's Pamphlet.

[Written for PRESS by C. H. AARON.]

Mr. Russell certainly deserves the thanks (and something more) of all who are interested, whether from a scientific or a practical point of view, in the treatment of silver ores. The amount of labor he has performed, though but partially represented by the pamphlet in question, can only be appreciated by those who have made more or less similar experiments.

Mr. Russell is apparently a candid and conscientious investigator, and as such will not object to a few comments, which may in some points savor of criticism, on the pamphlet in which some of the results of his labors are given to the world.

To begin with page 1, we find that "Mr. Russell has discovered that lead can be completely separated from a sodium hyposulphite solution, as carbonate, by sodium carbonate or purified soda-ash, without precipitating any copper or silver." The fact that I made the same discovery in 1882, as heretofore stated in your columns, would scarcely have been known to Russell, and consequently does not diminish the credit due to him, nor interfere with his patent unless in so far as that I have the right of using this part of the process. That I have not used it heretofore is simply because I have had no occasion. At the Silver King leaching works the lead was not particularly troublesome, because the roasted precipitate was refined by cupellation, in which an additional quantity of lead was requisite to work off the copper.

Passing to page 3: "In making chlorination tests of roasted silver ores, with a sodium hyposulphite solution, it has been generally assumed that the silver extracted is all in the form of chloride. This is not correct." The passage quoted is not quite candid; compare pages 93 and 132, etc., of my work on "Leaching Gold and Silver Ores," and investigations in 1876 published in the MINING AND SCIENTIFIC PRESS. This matter was also mentioned in my recent letter.

We now come to the "scientific" portion of the pamphlet. In "The Reactions of Sodium Hyposulphite Solution," we find that metallic gold and silver sulphide are insoluble, while gold sulphide, silver arsenate and antimonate, as well as cuprous chloride, lead sulphate and calcium sulphate are soluble, the latter best in cold, rather dilute solutions. In all this there is nothing particularly new or surprising, though the statement of the facts is very proper in view of what follows later. However, I venture to suggest that the behavior of compounds produced in the wet way, as some of these seem to have been, may differ from that of those formed in the furnace.

In regard to the solubility of silver chloride in sodium hyposulphite solution, the valuable points stated are that "by using solutions of more than 10 per cent concentration, the Ag. Cl. hardens into lumps," and that "temperature does not influence results materially." The latter statement, taken jointly with this, "the solubility of lead sulphate increases materially with the temperature of the solution," is verified in practice, it being well known that warm solution brings out more base metal than cold.

The author says: "The solubility of silver chloride may be determined in two ways." First, by exposing freshly precipitated Ag. Cl. to the solution (the method used by Russell). Second, by adding Ag. No. 3 to a hyposulphite solution which contains sodium chloride, until saturation is indicated by turbidity. The first method gives somewhat variable results, with an average of 0.4 silver chloride to 1 crystallized sodium hyposulphite in the solution. The second gives 0.485 to 1 and, according to the pamphlet, "the latter figures are to be considered as the more correct ones." It seems possible that the introduction of sodium nitrate in the second method may make some difference, but the question does not appear to be of any metallurgical importance. It is to be presumed that the salt used in the second method is a very small quantity, merely to indicate the ending or saturation point. However, the effect of salt in the solution should be determined, as that (or calcium chloride) will accumulate in the leaching liquid in practice.

The next conclusion is that the presence of lead sulphate in the leaching liquid does practically reduce the power of that to dissolve silver chloride and, to quote, "It is not astonishing that this should be so, because a part of the sodium hyposulphite is consumed in the formation of the lead-salt," alluding to the double lead and sodium hyposulphite which, with sodium sulphite, results. "Assuming that this has the formula $2\text{Na}_2\text{S}_2\text{O}_3$, PbS_2O_3 , and calculating the amount of sodium hyposulphite necessary in its formation, we find that the dissolving energy of the solution for silver chloride has been less reduced than should be expected, taking Mr. Russell's value of 0.4 for the solubility of silver chloride as a basis." Then follows a tabular statement showing that the actual reduction of solvent power is considerably less than the calculated reduction, from which I draw the inference that either the as-

sumed composition of the lead salt is incorrect or its presence increases the solvent power of the sodium hyposulphite remaining unchanged, notwithstanding the formation of sodium sulphate, which, in another place, is said to be injurious. These mixture questions become very complicated, and as they would seem to have only a practical value, it would perhaps be best to confine observations to practical results. In this case, the practical fact is that the presence of lead sulphate lessens the solubility of silver chloride in a given solution. I shall have occasion, further on, to point out what seems to be a false inference drawn by the author of the pamphlet from this and similar facts.

The efficiency of the leaching liquid is not sensibly lessened by presence of calcium sulphate, is the next point established by Mr. Russell's experiments.

Sodium sulphate "depresses the solvent energy of sodium hyposulphite for silver chloride." This is so far important that a considerable quantity of sodium sulphate will be formed in leaching ore containing lead sulphate where, as necessarily in Russell's process, the sodium hyposulphite is used instead of the corresponding calcium salt.

"Mr. Russell found that the presence of a very slight quantity of a caustic alkali, or an alkaline earth in a hyposulphite solution has a very deleterious effect on the solubility of silver chloride and other silver combinations." In adding one-half of one per cent of caustic lime to a sodium hyposulphite solution, the percentage of silver extracted from Ontario ore was depressed from 11 to 24 per cent.

"A sample of roasted Ontario ore, which yielded by lixiviation-tests (solubility assays), with ordinary solution 86.5 per cent, was first leached with water and then treated for 36 hours with sodium hyposulphite solutions of two and a half per cent concentration, to which various amounts of caustic soda had been added." Then follows a table showing that with 0.2 per cent of caustic soda only 6.5 per cent of the silver was extracted, and with 5 per cent 5.9 per cent of the silver was dissolved, on which the author remarks that "after the maximum effect has been produced, an increase of caustic soda is actually beneficial," which paradoxical looking, though not impossible, result seems to require confirmation, as only four tests are given, and "it appears that the effect of caustic soda is generally not so pronounced as in the example given above." It also seems that caustic lime is very much less injurious.

This matter is important, for, as justly remarked by the author, "caustics may be introduced into a lixiviation solution by the alkaline sulphides used as precipitants," and in the removal of lead by means of lime, as is done at the Mount Cory mill, or by soda-ash as proposed by Mr. Russell.

"If caustic soda is present in the lixiviation solution, Mr. Russell counteracts its injurious effect by making the solution slightly acid with sulphuric acid." That is, I presume to say, that sulphuric acid is added until the liquid becomes slightly charged with evolved sulphurous acid.

The effect of caustics, both practically and scientifically considered, seems to require further elucidation. It seems improbable that the mere presence of a small fraction of a per cent of caustic soda should have such a tremendous effect unless it produces a chemical change in the solvent or in the substance to be dissolved. As to the latter, it is known that caustics can convert silver chloride into oxide, but it would hardly seem that this could occur in a cold and weak solution; moreover, would not the silver oxide be soluble? It is not stated, and it is important from a practical point of view, whether in these trials the ore was leached continuously with fresh solution or simply steeped so long in a fixed quantity and then washed. The point to which I alluded when speaking of the effect of lead sulphate comes in here also, and in several other places. The author seems to imply that, because the coefficient of solubility of silver chloride is lessened by the presence of a certain substance; therefore, the ultimate result of the leaching operation is necessarily impaired. I confess that I cannot see why this should be so unless a change had been produced in the substance to be dissolved. In practice we leach as long as any silver worth the trouble can be got out of the ore, and the only effect of reducing the coefficient of solubility would be to lengthen the time necessary to complete the leaching. It is true that we judge of the practical termination of the extraction by the quantity of silver in a given measure of the leach, but that quantity necessarily grows progressively smaller, and must be very small indeed before we consider the work finished. Toward the last the quantity of silver dissolved must be a function of the quantity remaining in the ore in a soluble condition as to that menstruum, rather than of the strength of the menstruum itself, which must be weak indeed if it will not take up enough to justify continuing while there is much remaining. Of course I do not now speak of silver compounds which may be insoluble or hardly soluble in hypo. I suggest this as a matter for explanation.

We now come to paragraph 11, in which the removal of lead from the leach, by means of an alkaline carbonate is discussed. Mr. Russell proposes to use commercial soda-ash for this purpose. This sometimes contains sodium sulphide, sulphate, and hydroxide, all of which are injurious, but are easily removed.

"If lead is to be precipitated by this process, the use of calcium hyposulphite is not admissi-

ble; neither can a calcium sulphide be used for the precipitation." That is to say, in case the lead carbonate is to be saved, as Mr. Russell proposes, sodium instead of calcium salts must be used, and a special set of vats must be provided in which the lead may be precipitated as carbonate previous to the precipitation of silver (and copper, if present) as sulphide in another set of vats. If, however, the lead is not to be saved, it will answer to keep the leaching solution charged with sodium carbonate, and allow the lead to remain in the ore, as I contemplated doing at the Silver King works, or to place a layer of the carbonate on the top of the ore in the vat, after the washing and before the introduction of the leaching liquid. This, if feasible, would avoid the necessity for an extra set of vats.

"Mr. Russell's second and most important improvement" consists in a second leaching with a solution of sodium hyposulphite, to which a certain quantity of copper sulphate has been added. This he calls the "extra solution." For an interesting discussion of the compounds resulting from this mixture, the reader is referred to the pamphlet itself. The only remark I wish to make as to this part is that where the author alludes to the use of cuprous chloride in amalgamation, and says "it becomes too expensive for practical operations, and also produces a bullion of low fineness," I beg to differ. I and others under my instructions have treated thousands of tons of ore by amalgamation through the agency of cuprous chloride, at less cost than by roasting, and with an average result of 95 per cent of the silver contents of the ore, while the bullion got was, for long periods, and might have been always, from .900 to .998 fine. I presume, however, that pan amalgamation is meant, but even in pans cuprous or cupric chloride may often be used and often are used with very great advantage, and with proper management bullion of very good quality—over .900 fine is got.

It appears from Mr. Russell's experiments that while silver chlorides are less soluble in "extra" than in ordinary solution, the former dissolves metallic silver, silver sulphide and some unspecified, probably unknown compounds which exist more or less in roasted ore. The extra solution also dissolves gold sulphides (artificial).

Silver sulphides will not be found in any decently roasted ore, and the action of extra solution on it would have no practical significance, were it not for the suggested feasibility of leaching some ores in the raw state. It appears, however, that only artificially produced silver sulphide was tried, and this can hardly be considered a fair test, as the natural sulphide may behave differently, especially when combined with galena or copper glance, in fact it appears in another part of the pamphlet, that sulphureted compounds of silver and copper are not much acted on by this solvent. Much more important is the statement that metallic silver is dissolved by the extra solution, especially if warmed to 50° C. Ordinary solution also dissolves metallic silver slightly, according to Mr. Russell, and much more if warmed, but the efficiency of the extra as compared with ordinary, is stated to be as 9 to 1 if cold, and as 31 to 1 at 50° C. It would be interesting to ascertain the nature of the reaction, if not already known, by which metallic silver dissolves in a solution of sodium hypo. One thing is certain, silver is precipitated by either copper or iron, from a hypo solution, as a brilliant, adherent coat of metallic silver, with at least in the case of copper, solution of the precipitating metal. Perhaps this may afford a means of preparing Russell's extra solution, by treating some of the rich leach with cement copper.

Metallic silver may exist to some extent in ores which have been subjected to a chloridizing roasting, especially if all the requisites of such roasting are not present; if the ore is roasted without salt, a certain proportion of the silver is almost sure to be in the metallic state. It is not clear from the pamphlet whether a given quantity of metallic silver has ever been dissolved completely by either solution.

Metallic gold is not dissolved. Silver arsenate and antimonate are equally soluble in either solution.

We now come to practical tests on roasted ore at the Ontario mill. The ore is roasted in the Stetefeldt furnace. A tabular statement of lixiviation tests (solubility assays) covering a period of 10 months, gives the following results: Percentage of the silver extracted by ordinary solution 88.1; by extra solution 92.6. It is stated that the tests with extra solution were made by adding to one-quarter assay ton of ore 25 gm. sodium hyposulphite and five gm. copper sulphate, both previously dissolved in water, then the whole diluted to 500 c. c. and heated to 50° C. for one hour, then filtered, dried and assayed. Another set of assays were made "by the old method, that is, with ordinary solution," though whether otherwise in the same way, or by continuous cold leaching, we are not informed.

In making solubility assays I always leach until the liquid only gives a slight coloration with a soluble sulphide. We are not told whether this was done with either solution; however, Mr. Russell says "I have found that a longer time of exposure than one hour does not produce materially differing results." Some operators leave the ore soaking all night; I have found that the results so got were far inferior to those by continuous leaching.

With imperfectly chloridized Ontario ore, the difference between the tests made with ordin-

ary and with extra solution are very striking, ranging from 11.1 to 31 per cent in favor of the latter, the ore being roasted in the Stetefeldt furnace. In 49 samples of Bertrand ore, roasted in a modified Bruckner furnace, the average difference in favor of extra solution was 10.1 per cent. It is noticeable that with Alice ore in a Howell furnace the differences given are 3.7, 15.5 and 6. per cent; with Bruckner furnaces at different mills 3.2 and 5.6 per cent, and with a Howell, at Black Warrior, 1.2 per cent; while with a Stetefeldt furnace, at Manhattan and Lexington, we find 1.2 and 0.5 per cent recorded in favor of extra solution.

From what has been said, it will be readily seen that the difference in results becomes less as the silver in the ore is more completely converted to chloride, whether through finer crushing, more careful roasting or the greater fitness of the ore itself for the purpose, but I think the author may have generalized a little hastily when he says, "the difference decreases with the fineness of the ore," because some ores chloridize best when not too fine. In speaking of pan tailings containing some silver which is soluble in ordinary solution, the author says: "From such tailings a much larger percentage of silver is extracted by extra solution;" and then follows a table showing differences from 1.7 to 52.6 per cent more silver extracted from tailings at different localities by extra than by ordinary solution. This author next treats of the lixiviation of ores in the raw state, giving some very instructive results, though stating that certain ores, such as argentiferous lead carbonate, lead antimonate and "fahl" ores, are not suitable, and that the most appropriate classes of ores for the purpose are those containing native silver, silver sulphureted and the group of antimonial and arsenical sulphurets. I have before stated that partzite, an oxidized antimonial ore, rich in copper, yields 80 per cent or more of its silver to warm solution of sodium hyposulphite.

A tabulated statement of results of raw leaching tests on ores from many different mines shows considerable variation, as might be expected; but the advantages on the side of extra solution is given as from 3.8 per cent in the case of Bertrand ore containing 24 oz. to the ton, of which less than half was got by either solution, to 57 per cent in an ore from Durango, Mexico, containing 32.8 oz. to the ton, of which only 8 per cent was extracted by ordinary and 65.3 per cent by extra solution. From Lexington ore 68.5 per cent was got with extra solution, against 26 per cent with ordinary. Tombstone ore gives a better result in this way than the reported average by amalgamation.

It is to be regretted that no information is given as to the time consumed in obtaining these results.

The author states that fine crushing is essential, but further on says: "Recent investigations have demonstrated that * * * in the greater number of cases, crushing through No. 120, No. 30, and even No. 20 screen, produces no great differences in the percentage of silver extracted by extra solution."

In some cases the extra solution extracted less silver than the ordinary, but if the raw ore was first treated with ordinary and then with extra, the latter extracted an additional quantity of silver. Then follows another table of results, which the extra solution extracts from 48.1 to 93.7 per cent from various raw ores.

Mr. Russell experimented on leaching with ordinary and with extra solution samples roasted in the muffle without salt. The results, while showing the superiority of extra solution, were not satisfactory from a practical point of view, the highest extraction being 64.5 per cent, but they were useful in that they led up to the conclusion that a very brief roasting gave the best results. This led to experiments on ore roasted in a Stetefeldt furnace, in which the extra solution comes out considerably ahead, and from which the author suggests the possibility of lixiviating ores after a roasting without salt (in a Stetefeldt furnace?).

It is to be observed in regard to this series of experiments that the results got in leaching the samples roasted without any salt in the muffle were generally low, in most cases very low. Samples taken from the "inside of shaft and flue" of the Stetefeldt furnace gave better results, still not high enough; while samples taken "after the ore has remained 16 hours on cooling floor" give from 80.6 to 85 per cent, with extra solution. Now, the ore roasted in the furnace was unavoidably mixed with about one per cent of salt, owing to the difficulty of thoroughly cleaning the screw conveyors, etc.; moreover, though this is not mentioned in the pamphlet, the furnace itself must have contained a quantity of chloridized matter from previous roastings, which would give off fumes when heated, especially so at the "very high temperature" used. These facts must raise a doubt as to whether the improved results got from the furnace samples, as compared with the muffle roasts, were not due to the presence of chlorine during the roasting, and the doubt is not lessened by the fact that still better results were got "after the ore had remained 16 hours on the cooling floor." That the improvement was not due to an increase in the quantity of silver sulphate is proved by the results of leaching with water, as given in the tables. On the whole, the prospect for roasting without salt is not, as yet, encouraging, especially as it is well known that more of the silver is usually volatilized where no salt is used.

In my recent letter I asked if the cuprous chloride remaining in roasted ore in many cases was not as good as the added bluestone of Rus-

sell's extra solution. The author states on this point that "the extra solution formed by the cuprous chloride in contact with ordinary solution can only be very weak, and its effect cannot be very pronounced," and he might have added that as it is shown by the experiments that the extra solution should follow the ordinary, the copper of the ore comes into play at the wrong end of the operation.

Some experiments on the treatment of argenterous copper matte, by a combination of the Ziervogel process with that of Russell, give very good results. The author discusses the extraction of gold from chloridized silver ores with the general result that more may be got by leaching with hyposulphites than by amalgamation.

"Mr. Russell has not been content with mere laboratory experiments, but has tested his process on a large scale." He has among other things, "determined in 10 charges, of 2 tons each, the total amount of silver dissolved by the wash-water, and the amount recovered with cement copper," showing a final loss of 0.1 oz. per ton. The plan adopted where the wash-water contained zinc, copper and some silver, was to add calcium polysulphide while stirring, until the white zinc sulphide began to be permanent. The liquid then contained no silver. As Russell's process precludes the use of calcium salts, the author devotes a number of pages to the consideration of the relative economy of these and the sodium salts, with conclusions in favor of the latter. The solvent energy of the sodium salt for silver chloride being taken as 100, that of the calcium salt was found to be 91.5, the solution being of "one and one-half per cent concentration." This seems to have been hardly fair, considering the atomic weights of sodium and calcium, and the prices of soda and lime. It would seem unnecessary to discuss this question here, because the adoption of the process will depend primarily on the verification in practice of the alleged superiority of results. However, it is clear that a considerable saving of sulphur may be effected by the use of a monosulphide in place of a polysulphide for precipitation, unless the otherwise wasted sulphur is recovered by distillation or by boiling the precipitate with lime or caustic soda.

The author proposes to treat the precipitated sulphides of silver and copper with sulphuric acid and niter, with recovery of nitrated products by usual means, and production of pure silver, pure gold, and bluestone. Under "Practical Results at the Ontario Mill" on two-ton charges, we find an average of 88.6 per cent soluble silver by ordinary "chlorination assay" against 92.2 per cent by the new method, and, as actual results of the working, 92.6 per cent extracted. Again, in seven charges, the tests gave 90 and 93.9 per cent respectively, and the working 94.4. The economy of the process as compared with amalgamation is discussed, needless to say with conclusions in favor of the new process. A system of continuous leaching is suggested for low-grade ores, similar in mechanical details to that which I have proposed for the treatment of auriferous sea sand, by which a strong solution would always be got for the precipitation.

The remainder of the pamphlet is devoted to "Historical Notes" of the leaching process, and a comparison between Krom's rolls and the stamp battery, in which the rolls are shown to be cheaper and better than stamps, especially where the ore is to be treated by lixiviation.

It is natural that the writer of a pamphlet like the one in question, which has doubtless a commercial purpose, should present the best side of his case, but it cannot be disputed that, if the facts and figures here given in apparent good faith are verified by further experience, an important advance will have been made in the treatment of silver ores, and as we are assured that Mr. Russell is still at work, while others will certainly take the subject up, we may expect more of the same kind.

If I should find time and opportunity to make any experiments in this line, your readers shall have the benefit of them.

Notes.

I have proved that if cuprous chloride and silver chloride exist together in a hot solution of sodium chloride, the copper may be almost completely precipitated by a soluble sulphide, leaving the silver dissolved. This is because silver sulphide is readily converted to chloride by such a solution of copper. In like manner, if, as stated in the pamphlet, freshly precipitated silver sulphide is instantaneously dissolved by extra solution, it should be possible to remove the copper from a lixivium containing silver also, leaving the silver dissolved, to be afterwards precipitated in other vats as nearly pure silver sulphide.

The lead having been previously removed by sodium carbonate, fine bullion could be got by the usual roasting and melting process. This would require three sets of precipitation vats, or if the ore contained no lead two sets. As gold sulphide is somewhat soluble in hypo it might also remain dissolved, though it is a question.

As to the proposed treatment of the mixed precipitate with sulphuric acid and niter, it seems a little doubtful if all the gold would be left as a residue. Gold can be dissolved by sulphuric acid with the addition of a little nitric, and in decomposing a solution of gold in hypo by nitric acid, boiling until precipitated sulphur was redissolved (as sulphuric acid) the gold was also dissolved, though it must be remarked that this may have been due to a minute trace of salt

in the water with which the hypo solution had been made.

There are, especially down this way, many silver ores which contain no gold, and if copper were separated in the manner proposed, the cost of the acid plant would be saved and the treatment of the precipitates simplified.

Bonding and Selling Mines.

EDITORS PRESS:—I have read several articles in the PRESS, rather abusive of a class of men who have proved of great benefit in the past to the mine owner and prospector—middlemen. I may premise of myself, that I have, in years past, bought outright for cost, both on my own account and for a syndicate, have taken working bonds, paid forfeits, as high as five thousand dollars, besides work, grub-staked prospectors, and been through the mining racket pretty thoroughly, except that of stocking properties. In all, I have been interested in, perhaps, a hundred mines and prospects. This may entitle my opinion to some respect. This experience, some of it good and some very sad, has led me to the following conclusions, which cover the points raised in the articles alluded to:

1st. That a capitalist of known ability to handle large sums, should never go in person to a mine owner. He will be asked many prices for the mine. None but an expert, with knowledge of the local camp, is competent to judge of a mine, and negotiate for it, and get a fair price. Owners, generally, overrate their property. If not equipped with a mill they will have specimen assays or a small mill run, and swear by that superficial test. They have, sometimes, to put it mildly, been known to conceal fatal facts, that a cursory examination cannot discover. More caution is necessary in buying a mine than anything else under the sun. With the best judges many get left.

2d. The purchaser of mining property should have the same privilege of examination and test as with any other property. A certain amount of work is necessary to determine cost of extraction of ore, and milling a sufficient quantity to test its working value, when there is no reliable record, and to pay for this privilege is absurd. The cost is serious without. Indeed, to examine the many properties offered and find one good one costs a deal of money. When one is found looking fair, very likely the owner will ask thousands of dollars for the privilege of 30 or 60 days to examine the mine, and arrange payment, if even thorough examination establishes its value. He is afraid a little work may make it look worse, and wants to be insured against that calamity: while if it improved with a little work the purchaser paid for it, and is entitled to its benefit. The purchaser takes all the risk. The mine-owner is entitled to nothing unless his mine is worth something.

3d. Nine-tenths of all the money that has been invested in mines has been drummed up by middlemen, who have taken bonds on the mines, and worked them up in schemes in the financial centers. If the miner sits down in his cabin and smokes and dreams over his mine, and waits the coming of some capitalist to take his elephant off his hands, at a fabulous price, or any price, he will wait a long time. The men who go to the camps with money at command to plank down for a mine are precious few. There are a few mining capitalists in California that may have their experts out hunting for properties, but there are none in the East. The capital obtained in the past from the East, has been secured by the abused middlemen, who have risked expense and reputation in the effort, and they have placed properties that were never phenomenal enough to attract notice. At a time when "every prospect pleased" they worked off an immense number of properties, to the profit of the mine, and often to the sorrow of the investor. The miner has no cause of complaint. But for the middlemen, the poor prospector would long ago have come to grief. When merchants find it necessary to send drummers everywhere to sell what people have to buy, much more is it necessary "to drum" to sell what people are not seeking for, and only buy after an infinite deal of talk of the most glowing kind. So much expense is incurred, and so many have to be bought to co-operate, the price gets well loaded to the investor, and this has been a great evil in forming stock companies. But the miner got his harvest out of it. And now he will have to make all this allowance in his price, and ever will, or work his own mine himself. No one will sell his mine for him without a profit commensurate with the risk taken.

4th. Bonding a mine, for the foregoing reasons, to some reliable mine operator, is the more certain way of selling it. If he fails to sell, he advertises it well, and "howe" it into notoriety, and very likely, after his bond has expired somebody, waiting that event, will go direct to the owner and buy the mine, and the latter profits perhaps all the more. The operator takes all the risk, spends months of time, besides expense on a trip East, and perhaps to London, and then may fail to come to time. Though his work may effect a sale, he may get no benefit from it.

Finally, the mine owners and prospectors in the camps, who smoke their pipes over half developed properties and prospect holes, should understand that there is no boom in mines now in any of the financial centers. Indeed, as far as the East is concerned, it is not over safe to offer a mine. A streak of personal magnetism,

"cheek and chic" and favoring circumstances, are necessary to succeed, with the best of property. Intelligent investors will do little more than equip a property for the larger interest, and when a mine owner can get his mine equipped with a mill, and worked, and have even a quarter interest, he has a larger possibility in that reserve than in selling out, and chancing another discovery, for any price he could likely obtain outright. In the present state of feeling over mining, expert risks must be taken.

EXPERT MINER.

San Francisco, Oct. 15, 1885.

Mineral Wealth of British Columbia.

William Teague writes from Yale, B. C., to the *London Mining Journal* as follows: Knowing you are not very often troubled with communications from this remote quarter of Her Majesty's dominions, a circumstance which undoubtedly has precluded the outside world from becoming acquainted with the great mineral wealth lying dormant in this country, I feel it incumbent to convey before your readers the following particulars, which may prove interesting as emanating from one who has resided in the province for 27 years, dating from the gold excitement of 1858. Consequently upon the gold discoveries made at that time, British Columbia sprang into existence as a colony. The placer mines proving one of the richest alluvial deposits ever known, attracted large numbers of men to its shores to search for the precious metals, while some sought employment in the gold-diggings at £2 per day. The question of gold and silver mining now comes prominently to the front as a result of the premonitory indications which appear; and the attention of capitalists is being solicited to lay open properties presenting such unmistakable indices: no country in the world affording more favorable inducements, and no country more liberal in granting mineral rights of the Crown. A nominal charge of £1 per acre by the Government secures the title of the land without any further demand of taxes or royalty. Gold mining has been, and still continues to be a never failing attraction; silver mining is a more recent operation, and its developments are yet in its infancy. During the excitement attendant on the gold discoveries the silver-bearing ledges were disregarded, but of late the argenteriferous galena leads have been assayed with such gratifying results from the out-cropping for silver that it becomes increasingly apparent that silver mining will form one of the principal industries in the country.

With adequate machinery and additional small outlays gold mining would be far more remunerative and extensive. It is necessary to examine the deep channels and beds of streams in the immediate vicinity of gold-producing ground which would beyond all doubt prove remunerative. The auriferous deposits of British Columbia still hold forth every encouragement; they are undeveloped in many parts as evinced in prospecting. Among scientific men it is a well known fact that the great silver-bearing belt extends its course northward from New Mexico into Colorado, Wyoming, Nevada, Idaho, through British Columbia, trending its northerly course into Siberia. During my sojourn here I have examined samples of argenteriferous ores which are indisputably connected with richer deposits at deeper sections, and the quartz of which is analogous to that found in Nevada, California and other renowned silver-bearing districts. Lithologically the general characteristics of the rocks I have observed are almost identical with those forming the Cordilleras, on the western slopes of which are situated the Chilean silver mines, and which have given prodigious profits. The stratification, too, are encouraging features, being associated with the silver-bearing rocks of the world, and which are indispensably necessary for the production of metalliferous ores as water is for the life of a man. The agricultural lands of the province are very limited; the external appearance of the surrounding mountainous country presenting that peculiar barrenness which nature often stamps upon the surface beneath which her rich treasures of mineral are deposited. The country, however, possesses timber belts unexcelled by those of any other country, and that they will be a source of unlimited wealth, affording in due course much employment is a foregone conclusion.

British Columbia alone contains an area of 341,305 square miles, and there is not a shaft sunk 200 feet deep on any of her mineral resources, except for coal at Nanaimo. The operations in connection with gold mining have invariably been very shallow, and what have been so far wrought upon in the shape of quartz mining have been injudiciously managed by inexperienced hands, swallowing up a large amount of capital, producing the most abortive results. What has also militated against successful mining in the province has been the remoteness of the localities from railway communication, thereby entailing considerable costs in the transportation of necessary material of freights, a grievance now happily remedied. In all probability ere this letter reaches you the unfinished gap between the Selkirk range and the gold range of mountains will be *un fait accompli*. With the completion of the Canadian Pacific Railway, converting British Columbia into one of the world's highways and forming an important era in its future industries, every facility will be afforded for communication with

all parts of the world hitherto so far distant and difficult to reach, and thus placing the explorer in a position to examine vast tracts of unexplored ground, which eminent scientists, judging from the congenial geological features of the province generally, state must be highly mineralized. The excitement caused by the great discoveries of silver and gold in various adjacent parts of the United States has prevented proper attention being paid to the mineral resources of this province. Prospecting, too, in the past, owing to the circumstances I have mentioned, was a most arduous task, and mining operations have, therefore, languished. Mines can be worked very cheaply; there are inexhaustible supplies of wood and water in abundance to meet all purposes. Few countries, then, offering better and safer inducements for profitable mining do not exist. Similar indications as present themselves here have given birth to many famed mines in Nevada and other parts of the world, and with such reassuring prospects the time has arrived when it behooves British capitalists to open up these fields of hidden wealth.

The Law of Trade Marks.

A. L. Bancroft & Co., of 721 Market St., S. F., have issued a second edition of "A Treatise on the Law of Trade Marks and Analogous Subjects" (firm names, business signs, good will, labels, etc.), by Wm. Henry Browne, of the Bar of the Supreme Court of the United States. We are pleased to acknowledge the receipt of the above work.

We are pleased to acknowledge the receipt of the above work. The author, in his preface, states as a reason for issuing a second edition, revised and enlarged, the crude state of the law at the time of the issuance of his first edition, some years ago. Since that time there has grown up a more full appreciation of the importance of this subject. This has been manifested in many treatises and acts of legislation, these latter referring not only to our own country, but to almost every country of the civilized world.

With greater sources of information at hand, the author has, therefore, considered it necessary to re-write his work, bringing, as he says, "order out of chaos."

In looking over the contents of the work, the reader will be impressed by the completeness of the arrangement of matter and the ground which it covers. As in all law books, an index to the cases cited, is given. An introduction follows which is a complete and exhaustive essay upon the origin, growth and utility of trademarks, the definition and nature of which, and the ownership and protection of such property being also fully set forth. He also gives many examples of trademarks. Then follows a resume of the federal legislation upon this subject. The work further treats of infringements, actions in law and equity, defenses and damages. There are also chapters upon rights analogous to those of trademarks, the practice in the Patent office, interferences in the Patent office, and the abandonment of this class of property. An appendix accompanies the work, giving the treaties and conventions upon this subject of a number of countries, and also the trademark laws of all countries were such property exists.

It will, therefore be seen that the work is very complete in its character and fills a want which has been felt, not only by lawyers, but by merchants who desire to know their general rights in such property.

WIPE SPECTACLES.—The old gentleman with his spectacles, the "Lord Dundreary" with his "glasses," the myopic reader and short-sighted persons generally, who carefully wipe the dimness from their spectacles and eyeglasses with silk handkerchiefs, are perhaps not aware that a piece of paper will do the service much better. No matter how fine the silk may be, it will not leave the surface of the glass so finely polished as the paper will. If pains are taken to lightly brush off any particles of gritty dust that may be on the glasses before rubbing them, the paper will never injure their surface with the slightest scratch. Dampen the glasses with vapor or water, or possibly with the breath, and the paper will absorb all the moisture and whatever else is deposited on the glass, now in a much softened condition. The best paper is unsized and quite porous, like the paper used by newspapers. Blotting paper leaves short fibers on the glass and is not desirable.

A VALUABLE discovery of petroleum has been made on Vancouver island. A sample was taken to Victoria and gave very satisfactory tests as to its burning quality and specific gravity. The scene of the discovery is a point near the eastern side of Vancouver island, and within five miles of the seashore, where there is a good harbor for ships.

A TYPE-SETTING invention, which has been long perfecting, and which it is said will revolutionize type-setting, will soon be practically introduced in New York. It has been claimed that anyone capable of using a type-writing machine will be able to set type and stereotype at the same time the type required for printing the newspapers.

THREE teams and a force of men have constant employment at Monterey in putting up and shipping sand to San Francisco, San Jose and other points.

TABLE OF CONTENTS.

EDITORIALS.—An Efficient Mining Pump; The Crescent Mine, 273. Passing Events; Edible Fungi of California; Harbor Improvements; Quiescent Mercury for Amalgamation, 276. The Silver Question; The Hartford Smelting Furnace; The State University; Silphium and Arsenic from Ores, 277.

ILLUSTRATIONS.—The Worthington Pump in Level No. 5, Alaska Mine, Sierra County, Cal., 273. The Hartford Portable Smelting Furnace, 277.

CORRESPONDENCE.—The Russell Leaching Process, 274. Bonding and Selling Mines, 275.

MECHANICAL PROGRESS.—The Possible Metal of the Future; General Machine Works; Oil in Boxes, 278.

SCIENTIFIC PROGRESS.—Peculiarities of Lighting; Government Aid to Scientific Research; Lamp Shades and the Eyes; Nitrogenous Substances; A Large Meteor; To Determine the Condition of the Atmosphere in Cities; Solids Carried by Rivers; Smoke Consumption; Ether vs. Chloroform, 278.

USEFUL INFORMATION.—Women's Complaint About Car Seats; How Bees Predict the Weather; How Sealed Cans are Tested; To Clean Hair Brushes; A Fisherman's Knife; Wax Matches are Made in this Country; A Wash for Old Painted Woodwork; An Expensive Spire; Another Wood-Filler; Lathe Cement; A Fine Exposition Building; Mice as Fishers, 279.

GOOD HEALTH.—First Indications of Consumption; Pneumonia and Ozone; Removing Hair and Freckles by Electricity; Sore Throat; For Kidney Trouble; Proportionate Value of Railway Accidents; Medical Value of Small Fruits; Hot Water in Syncope; Mustard Plaster that will Not blister, 279.

MISCELLANEOUS.—Mineral Wealth of British Columbia; The Law of Trade-marks, 275. Growth of American Manufactures, 279.

MINING SUMMARY.—From the various counties of California, Nevada, Arizona, Montana, New Mexico, Oregon, and Utah, 276-77.

MINING STOCK MARKET.—Sales at the San Francisco Stock Board. Notices of Meetings, Assessments, Dividends, and Bullion Shipments, 254.

Business Announcements.

Ore Pulverizer—Fulton Iron Works, S. F.
American Exchange Hotel—S. F.

Passing Events.

The mining region around Granite creek, B. C., is developing an excitement, large pay being reported in Victoria. A town is being built, and crowds are rushing to the diggings. No details have so far come to hand.

The rich strike in the Crown Point mine, Nevada county, which used to be known as the William Penn, is making some excitement, and is another proof that many of the old abandoned mines will pay to develop under the better conditions of to-day.

The burning of the big railroad bridge across the Colorado entails great loss and delay, but another will be immediately built.

The new gold discovery, six miles east of the junction of the San Pedro and Gila mines, Arizona, is attracting attention. The ore is said to be generally of high grade, and is free milling.

In Idaho, Montana, Colorado, and the more elevated regions, some of the mines are beginning to shut down for the winter. An advantage possessed by this State is that there are few places where quartz mining cannot be carried on all winter.

Edible Fungi of California.

Almost everybody knows the common mushroom (in scientific nomenclature, *Agaricus campestris*), which grows everywhere, and is universally eaten; but few know that there are many others of the fungus family which are eatable, and which are at the same time abundant in this State. They form sources of nutritious and palatable food, which are at present wholly neglected or utilized by a very few of our foreign population.

Dr. H. W. Harkness, Vice-President of the California Academy of Sciences, is an enthusiastic mycologist, and has made a special study of this class of plants. At the meeting of the Academy this week, he exhibited several varieties of edible fungi which are found in this State, and which are in season at the present time. He stated that next in economic importance to the common mushroom in this vicinity is the *Boletus granulatus*, specimens of which were shown. The boletus is distinguished from the common mushroom, by the fact that the under surface, instead of rows of vertical plates (gills), presents in the young specimens a smooth and even surface, which, at maturity, shows the openings of numerous tubes placed side by side, somewhat larger and slightly resembling the depressions of a thimble, though much deeper.

Of this genus three species are found in the vicinity of San Francisco, all edible. Possibly others may occur, but they have so far escaped scrutiny. Two of these species are not yet in season. The third is now found in the Park, and its season is just commencing. This species grows under pine and cypress trees. It is hemispherical, of a dirty white color, becoming brownish yellow when mature, and covered with a slimy secretion to which adheres pine leaves, etc., underneath which it emerged from the ground. The under surface on the young specimens is creamy white, nearly smooth, and dotted here and there with globules of milky juice. Later the milky juice disappears and the surface becomes a yellowish mass of open pores, lined with a membrane which produces the reproductive bodies (spores) by which the future generations are assured.

The specimens exhibited by Dr. Harkness were very small, but later in the year, when the moisture is plentiful, they are often found eight inches or more across at maturity. The Doctor testifies from personal experience to the eatable qualities of this boletus. Its taste is quite unlike that of the mushroom but quite as agreeable. It is of a firmer flesh and requires more cooking. The skin is readily removed and the creamy white then revealed looks much like a slice of Bellflower apple. They are even more liable to be attacked by insects than the mushroom and the mature ones should be avoided on this account.

The garden slug, which loves the toothsome morsel, is extravagantly fond of this fungus, and it is often discovered early in the season when too small to rise above its coating of pine needles, by the presence of a small army of this pest, all apparently doing nothing in particular, until a closer inspection would reveal them with head underneath the leaves, luxuriating in their chosen tidbit.

Thousands of pounds of this delicious food rot yearly under the trees in the park, and on the University grounds at Berkeley. It is quite as good eating and much safer than the mushroom, for it is absolutely impossible to mistake it for anything else. It should be introduced at our markets for common use.

Another important fungus is the *Helvella lacunosa*, which belongs to the family of the Morels. In structure it approaches nearly to the truffle. It is found sparingly everywhere in the vicinity of San Francisco, chiefly under oaks. It has a white, irregular stem and a black, irregularly convoluted head. Its spores are borne in long pod-like sacs all over the black surface. At maturity it emits its spores in a cloud on receiving some slight jar which usually somewhat mystifies the observer who sees it without previous knowledge of the phenomenon. Its flesh is firm and thin and, unlike most fungi, it can readily be preserved by drying, strung like dried apples, and used at any time.

It is ordinarily used for flavoring soups, etc., though it may be cooked in any way preferred, and having once been seen in nature, or in a picture, cannot be mistaken.

The *Helvella Californica*, a species peculiar to this State, but not found near San Francisco, and *Helvella conica*, which is found in the Coast range as well as in the Old World, belong to the same genus as the last and are used in a similar manner.

Of the tubers, or underground fungi, Dr. Harkness exhibited two species. *Tuber rufum*, or red truffle, is of no economic importance. The other, *Tuber magnatum*, the white truffle, has not yet been found in sufficient quantity, but is prized in Europe though not considered equal to the black or Perigord truffle. Many of the species of underground fungi which are so numerous in this vicinity would be excellent articles of food if they were sufficiently abundant, and, fortunately, their wholesomeness is above suspicion.

Harbor Improvements.

The Government has not spent very much money on this coast for harbor improvements, but in some cases it has been an absolute necessity to do so. The mouth of the San Diego river has been turned from San Diego bay into False bay, so the material brought down would not fill in the harbor. Wilmington harbor, the sea-port of Los Angeles, has been formed by a breakwater, so that shelter is now provided instead of an open roadstead. Oakland harbor has been formed in San Francisco bay by the construction of two stone sea-walls or jetties to confine the channel, and a great deal of dredging has been done. San Francisco bay itself has needed few expenditures. The blowing up of Blossom and Rincon rocks comprise about all that the Government has had to do in the matter of harbor improvement.

The most important work that has to be done on the coast is that going on at the mouth of the Columbia river, Oregon. The bar at this river is the worst on the coast, and one of the worst in the world. There have been many wrecks there and the surroundings and conditions are such that the improvements are very expensive indeed.

Col. Geo. H. Mendell and Capt. Powell, of the U. S. Engineers, have just been visiting the works at the mouth of the river, where the jetty is being built. Work is still going on, but will cease at the end of the month, when all the material will be boused awaiting a further Congressional appropriation. The jetty extends 4200 feet from the starting point, 1200 feet of which are brush and rock. Col. Mendell is well satisfied with the results so far. Nature seconded the efforts of the engineers at every step advanced, and the effect already produced is, the Colonel says, the most satisfactory proof that the original plan for the improvement of the Columbia river bar adopted by the Board of United States Engineers was the right one. Captain Powell states that special precautions have been taken to so strengthen the completed end of the jetty that it will withstand the heavy seas which roll in during the winter storms.

It is unfortunate, in all this harbor work, that progress is delayed by uncertainty of appropriations by Congress. This not only entails increased expenditures in the end, but actual loss. The engineers are hampered by the system and the work takes a long time to complete. Instead of appropriating a lump sum to do the work, as is the custom abroad, we give more or less each couple of years, and when the fund is exhausted, the work stops until a new appropriation is made. The system is very bad, indeed, and in some cases entails an expenditure of twice the sum which work done promptly would require.

SHIPMENTS of coin from the overcrowded vaults of the different sub-treasuries to the Treasury at Washington since the general transfer began—September 31—amount to about \$26,000,000 in silver, and about \$5,000,000 in gold. The \$10,400,000 in silver brought from New Orleans in naval vessels is included in the above statement. All the gold came from San Francisco, from which place about \$13,000,000 in gold had previously been sent to New York by registered mail. Several millions in gold were sent East from here in fruit cars last week, the train looking like an ordinary fruit train.

The Big Bend tunnel is in a distance of over 10,000 feet, and will be ready in March next to receive the North Fork Feather river and dump it into the "Dark Canyon."

Quiescent Mercury for Amalgamation.

A new idea in amalgamation is that of overcoming the disturbing effects of a current caused by the rising of ore through mercury by allowing the mercury to remain for a sufficient time in a state of quiescence for complete amalgamation to take place, or for the operation of gravity, while at the same time a continuous operation is carried on. In most cases where a mass of mercury is used, the amalgam, or amalgamated particles of the triturated ore, is, to a greater or less extent, carried upward by the currents, together with the lighter particles. Abel H. Bliss, of Chicago, has produced an appliance founded upon the hypothesis that separation can be most effectually attained by combined action of amalgamation and gravity the latter being assisted by a downward current in the mercury, while the ore is passing upward.

These actions are still further assisted by the retention of the ore beneath a body of mercury by stopping its upward passage for a brief time, giving the particles of a superior specific gravity time to descend, and giving amalgamation time to act. That is to say, according to the argument of the inventor, if a body of ore reduced to a finely divided state is allowed to pass into a chamber containing mercury in a state of quiescence, and is caused to remain there for a brief period, and then is allowed to pass into a tray of mercury or another chamber above the first, a portion of mercury in the upper chamber simply exchanges place with the ore rising from the lower chamber, producing a downward current of the mercury, whereby the free metal and amalgam are carried downward, and ultimately settle upon the bottom. If the operation is permitted to take place through a series of vertical chambers opening and closing alternately, and if mercury is caused to flow in a circuit through these, proportioned in its speed to the quantity of the rising ore, whereby they are constantly kept filled, it is obvious that the operation will be rendered continuous.

In this way ample opportunity is given for the amalgamation to take place, while the downward current of the mercury aids the descent of the amalgam, and of that which does not amalgamate, but which has a specific gravity superior to that of mercury and carries it to the bottom. In addition, the pulp passing to the top of a chamber and then receiving the pressure of the mercury from below increases the tendency of all the heavier particles of the ore to descend into the mercury and accelerate the amalgamation.

Mr. Bliss has invented an apparatus to carry this process into effect, which consists of a combination of the following elements: a vessel for containing mercury, a rotary stand-pipe supported within the vessel and having one or more discharge openings near its lower end, and a hopper at its top; means for permitting the stand-pipe to be revolved; a hollow body of smaller diameter than the mercury vessel, and standing around the stand-pipe within the vessel, and opening at or near its base into the space surrounding it, said body being formed in sections superposed one upon another, and divided by partitions into compartments having openings in their tops; sliding plates in contact with the top of the compartments and provided with openings to register with those in the said tops, and mechanism for sliding the said plates back and forth through the revolutions of the stand pipe, comprising cams upon the stand-pipe and spring mechanism operating in opposition to the cams.

From the foregoing description it is seen that the process consists first in introducing the pulp beneath a column of mercury and alternately stopping its upward progress, and permitting it to continue the same, whereby for one or more brief periods in its passage through the mercury, it is caused to come to rest within the mercury in a state of quiescence; and also in creating downward currents in that portion of the mercury through which the pulp rises in intermittent stages, thereby aiding the settlement of the amalgam and of the heavier particles. Provision can be made for more or less compartments or vertical series according as ore presents more or less difficulty in treatment. Thus, whereas a single stoppage and release will suffice for some ores, with others the best results can be received only by causing it to be stopped and released several times in the course of its upward progress.

The Silver Question.

When the Federal courts decided that hydraulic mining, as conducted in this State, was unlawful, the gold mining industry of California received a severe setback. But if the Government demonetizes silver the whole mining industry of the country will receive a blow, the magnitude of which can scarcely be comprehended. There are so many millions of dollars invested, and so many thousands of men employed, that capital and labor alike will feel the ill effects. Therefore, the silver question now being agitated is of the utmost importance to the mining interests. Should silver be demonetized this coast, particularly, will suffer, as no silver mining is carried on in the East. It is the Pacific States and Territories which will be most seriously affected. But Eastern bankers and money lenders will scarcely consider that much importance if they can have their way. California is not so vitally interested as other States and Territories, her precious metal product being mainly gold; but our miners have experienced here the effects of the stoppage of one class of mining, so they will know how to appreciate the sufferings of others, if silver mining is discontinued.

Nevada is specially interested in this question as she is the "Silver State." At the meeting of the Nevada Silver Association at Virginia City, on Tuesday, ex-Senator Stewart delivered a stirring address on the silver question. A series of resolutions was adopted as follows:

Resolved, That we view with alarm the bondholders' conspiracy to depress labor, destroy values, and paralyze the energies and industries of the civilized world by their agitation to demonetize silver—a policy which, if successful, means low wages, low prices and social degradation, with a tendency to human slavery.

Resolved, That the enormous bonded indebtedness of the world, amounting to not less than fifty thousand millions of dollars, in the hands of a few unscrupulous aristocrats, has already destroyed all hope of liberty in most of the Old World, and is threatening the independence and future of the American people; that by retiring one-half of the metallic currency of the world, the basis of values upon which this bonded indebtedness was created, the debt itself is virtually doubled; it is, therefore, a plain proposition that he who goes in debt sells money short—that is, agrees to deliver at a future day something that he does not then possess; understanding this proposition, the object of the manipulators of the bonded indebtedness of the world is to make gold dear and labor cheap, and thereby increase their mortgage upon the productive resources of the world.

Resolved, That the demonetization of silver will compel the producer to pay the bondholders two bushels of wheat, two hales of cotton, and two tons of iron where he contracted to pay only one.

Resolved, That to the people of Nevada the agitation to demonetize silver is the more especially aggravating since the success of such a policy involves the annihilation of millions of dollars worth of capital locked up in their mills and mines, thus inflicting ruin and bankruptcy upon a people who have, under the encouragement of the Government, developed the mining industry and established their homes in a remote Territory, where they have successfully planted all the influences of American civilization, and founded a free and sovereign State.

Resolved, That our Senators and Representatives in Congress, irrespective of party, be requested to use their influence by all honorable means to avert so dire a calamity as is involved in the threatened demonetization of silver.

The Hartsfeld Smelting Furnace.

The engraving on this page represents a portable smelting furnace which is manufactured by the Hartsfeld Portable Smelting Furnace and Mining Company, Newport, Ky. The furnace has been put to use in Austria, Hungary, Russia, Norway and Sweden, Holland, Belgium, France and Germany, and is now being introduced in England, Australia and the United States. The cost and weight of the furnace are both small. The whole structure is made complete at the shops, of wrought-iron and steel plates, and in sections for transportation. No brick-work is required. The water circulation is claimed to be perfect, preventing any scales from the steel plates and overheating. The plant is comparatively inexpensive and the furnace can be run continuously without expensive manual labor or frequent stoppage for repairs. The furnaces are built in capacities of 1-ton, 5-ton, 10-ton, 30-ton and 50-ton, the largest sizes being recommended as the most economical as to cost and attendance. The manufacturers state that there need be no hesitation about difficulties in smelting any ores that run above seven ounces in silver per

ton, "as the most refractory ores, with 10 per cent lead, with the Hartsfeld process will run like butter and separate like oil and water from each other by gravitation." Charcoal or coke is preferred as fuel, one ton to every ten tons of ore; properly speaking, 10 to 12½ per cent of fuel. Coal will answer. Dry wood has given very good results, but requires 15 to 20 per cent of fuel by weight, and is a one fifth slower process than the former.

This furnace can be worked by any metallurgist who can read the printed instructions furnished with every furnace sold how to set up the furnace and test it; how to mix and prepare the Hartsfeld inexpensive basic fluxing process. This furnace is free from clogging or hanging, because the space in the furnace widens as the charge recedes downward until the blast reduces it fluid. (See cut.) The steel inside is smooth without any rivet heads projecting, and kept cool by the water continuously circulating in spiral form until it arrives on the top of the blower, from where it passes downwards into

columns, blast and tuyer pipes, water pipes, valves and fittings, slag pots and spouts, boiler-plate foundation, curb pressure gauge, etc. one elevator to feed furnace; three sets of Hartsfeld's metal molds with company's brand; six slag pots, two slag trucks; six ladles, one set furnace irons; one No. 4½ Baker pressure blower; one 20 horse-power engine to drive pressure blower and elevator for the 30 ton and 25-horse power for the 50 ton; one 25 horse-power tubular boiler, one steam boiler feed-pump, one pump for supplying furnace; all necessary pipe and fittings, valves, connections, etc., shipping weight about 34,000 pounds. A one-ton capacity furnace plant contains the following: Furnace with hand blower, metal dust condenser, metal molds, blast and tuyer pipes, water pipes, valves, slag pots and a set of furnace irons. A five and 10-ton plant, includes all the attachments as for 30 and 50 ton, excepting elevator, also smaller sizes of the necessary machinery.

The inventor states that the cost of reducing

THE HARTSFELD PORTABLE SMELTING FURNACE.

the metal dust condenser, in a steam like vapor, carrying with it all and every particle of metal dust, and depositing in the lower condenser water space (heretofore principally lost) where the gases are stripped of their metallic contents before passing out on the other side and are reused for the hot blast stove (not shown), and for generating steam for the boilers; also for the metal separatory (or better known as the lead well), for an even temperature. It is claimed that all points of economy are embodied in this furnace plant.

Mr. Hartsfeld has won fame as a builder of furnaces in Europe, and the merits of the present devices have already been recognized in many of our continental countries. Every furnace sent out is guaranteed as to durability, economy in fuel, and ability to save the precious metal. The total weight of a 50-ton furnace set up complete is 12,400 pounds, and its size is 7x29 feet. The capacity of the smallest furnace built, is five tons in eight hours and its weight is 1600 pounds. Its size is two feet three inches in diameter by seven feet six inches in height.

The general specifications for a complete plant is as follows:

One 30 or 50-ton smelting furnace, complete, with portable metal dust condenser, gravity metal separatory, as shown in cut, including

ore is about \$4 to \$5 a ton on a 50-ton smelter. Rebellious ores containing antimony, tin, zinc, bismuth, etc., do not affect the fluxing process nor the furnace by reason of the peculiar form in construction and attachments. The manufacturers state that the bacciferous fluxing process is in a printed form, and is only sent to those who have adopted the furnace.

JUDGE EDMONDS has decided the case of the New River Hydraulic Mining Company vs. Joseph Lufken *et al*, in favor of plaintiff, as prayed for in the complaint. The action was brought to recover judgment against Joseph Lufken and James W. Duncan for \$10,000, against Chester Brown for \$5,000, against Joseph S. Taylor and C. E. McNear for \$2500 each, as damages sustained by a breach of contract for the construction of a ditch and flume of about nine miles in length from the upper end of Hawkins Bar, on Trinity river to a point on New river in Trinity county, and also for the construction of a saw-mill with machinery of a capacity of sawing not less than 20,000 feet of lumber every 24 hours.

The State University.

Since the resignation of President Reid of the University of California, the Board of Regents have been in search of a suitable person to fill the chief position at the University. There seems to have been an idea prevalent that affairs were not being conducted in a manner to make the institution popular. The Regents, being aware of this sentiment, have been anxious to select some person of reputation and experience, to take charge of the University, who would tend to popularize it, and would have administrative ability to conduct its affairs in a more satisfactory manner. The finances of the University are in good condition, and its standard of scholarship is good. The various departments are under the supervision of competent persons who are interested in their special work, and there seems no reason why the institution should not prosper and be a source of pride to the State. That it has not held the position hoped for has been attributed to the fact that the Presidents have not possessed all the requirements necessary to advance a young and growing seat of learning.

On Tuesday of this week, the Regents of the State University elected Dr. E. S. Holden, a distinguished Eastern scientist, to the presidency of that institution. Professor E. S. Holden is a native of Missouri, from which State he was appointed as a cadet to the military academy at West Point, and from which he was graduated in 1870. He was then assigned as a second lieutenant to the Fourth Regiment of Artillery, serving in it for two years, when he was transferred to the Corps of Engineers of the army. He resigned his army commission in 1873, and devoted himself to the study of astronomy, for which he had a great natural predilection. He was attached for some time to the National Observatory at Washington, and had charge of one of the astronomical parties which on one of the islands of the southern seas made the observations on the late transit of Venus. Though but 37 years of age, Professor Holden stands in the foremost rank of astronomers, and it was this fact that was largely considered in his selection and election. The Regents appointed Professor Holden to the Directorship of the Lick observatory, as well as to the presidency of the University. For fitness to the presidency the professor brings the reputation of a high standing in the literary and scientific world.

Sulphur and Arsenic from Ores.

An Eastern inventor has recently devised an apparatus for treating ores for the removal of sulphur and arsenic from them. He has a jacketed cylinder mounted upon longitudinal and transverse trunnions with movable bearings, so that it may be rotated on transverse pivots for charging and discharging, and on its axis for agitating the contents. It is provided with pipes to admit and discharge steam, superheated or otherwise, to the jacket surrounding the cylinder, and with one or more pipes and manholes communicating with the interior chamber, for the introduction and removal of materials to be treated, and for the discharge of aqueous and other vapors which are thrown off by the heat, assisted, when required, by exhaust through the discharge pipe or pipes so as to create more or less vacuum.

Condensation of the superheated steam in the jacket space while the apparatus is in operation is provided for. By turning the cylinder on its radial trunnions, either of the two manholes may be brought to the top for charging the cylinder, or to the bottom for discharging it. Its axial trunnions may be used for agitating the material under treatment. By the aid of a nearly complete vacuum and alternate heating and cooling of the ores, the inventor thinks that deleterious matter may be effectually discharged therefrom.

THE President has virtually decided to postpone the appointment of a superintendent of the Coast and Geodetic Survey until after the meeting of Congress. It has been suggested to the President that an engineer officer of the army or navy might properly be detailed to perform the duties of the office. What seems more proper, however, is to promote one of the assistants to the position. They have had the training and experience, and no mere politician is suited for superintendent of a department requiring technical knowledge.

MECHANICAL PROGRESS.

The Possible Metal of the Future.

The mechanical and scientific world have long been looking for some method of producing the valuable metal known as aluminum in so cheap a manner as to render it generally available in the mechanic arts. Up to within the last three or four years it has been fairly entitled to be ranked as among the rare and precious metals.

It first became known to science and the world about 50 years ago. Very soon after its discovery its valuable mechanical properties became quite fully known, and an immense amount of money has been expended in experiments to reduce the cost of its product, which, until recently, has been fabulously high. The largest block of the metal which has ever been made is that which forms the cap of the Washington monument, which is said to have cost \$2 per ounce.

New Process for Its Manufacture.

Quite recently several experimenters have come forward with claims for new and comparatively cheap processes for the manufacture of aluminum. One of the first on the list is the Messrs. Cowles, Cleveland, Ohio, who made the block above alluded to for the Washington monument. These parties claim to have made a direct reduction of aluminum, manganese, magnesium, sodium, potassium, calcium, strontium and other metals, as well as the costly metaloids boron and silicon, from their oxides. They effect this by means of electricity, and an account of their discovery has been read to the Science Association meeting at Ann Arbor. The cost of the process is so small that the inventors expect "to make as great a revolution in the brass, bronze and German silver trade as the Bessemer process has in the iron trade." An enthusiast predicts that from this invention the best bronze, 10 per cent aluminum, 90 per cent copper will be made at a cost to compete with brass; that bronze and various alloys of aluminum will compete with iron and steel in the manufacture of many articles for which they are intrinsically better adapted, and that aluminum, which closely resembles silver and is much less subject to oxidation than that metal, will supersede plated silver and nickel in table cutlery and plumbers and gas-fitters' goods. This process is said to be substantially one for smelting the ore, which is common clay, by direct process by aid of the electric current.

The *Railroad Gazette* recently announced that the editor of that journal had been assured that a member of a firm of high standing, well known to railroad men, has perfected another process for producing aluminum in large quantities and at a very low cost per pound. This process, the *Gazette* is informed, is an entirely different one from the Cleveland process, and one by which, it is claimed the metal can be produced at a still lower cost.

An English Process.

Our English cousins have recently become very much elated over the apparent success of a process invented by a well known metallurgist of that country—Mr. James Webster. According to the *Pall Mall Gazette* aluminum bronzes are now being produced, under the Webster aluminum process, at a point about six miles distant from Birmingham, in such quantities as to keep a manufactory which covers half an acre of ground at work both night and day. Mr. Webster claims to have continued his experiments over a term of 30 years, and to have greatly reduced the original cost of the production of the metal.

It is claimed by the *Gazette* that Mr. Webster "has discovered a method of making alumina by burning alum, instead of, as is usual, by precipitation. Alumina, however, is not aluminum. There is a long stage between a fine gray powder and a firm white metal, and, though Mr. Webster has succeeded in shortening this somewhat, the process of manufacturing the metal from the powder is still very much what it has been hitherto. Twelve tons of alumina deposit go to the manufacture of one ton of aluminum, and the exact meaning of the new discovery is that this alumina can be obtained by a much shorter process in much larger quantities and at one-tenth of the ordinary cost. It does not follow that the cost of aluminum is therefore one-tenth what it has been up to this time, nor that it will be thrown upon the market in such bulk as to seriously interfere with some of our principal industries. What is actually certain is that a metal, which has hitherto been very difficult to procure, can now be applied to a great number of purposes for which it has not been available on account of its scarcity. Mr. Webster burns alum and pitch in a calcining furnace, and produces therefrom, as the result, a gray cinder, in appearance not unlike the refuse of an engine fire. According to all scientific authority, this cinder ought not to be anything more valuable than burned alum. By further process however, it is converted into something which contains almost 90 per cent of alumina, and which, in process of manufacture, has left behind several by-products of almost sufficient value to defray the cost of working. After this, Mr. Webster, to use his own phraseology, "got what he wanted" in the shape of a gray powder, about 89 per cent in fineness. By the new process of manufacturing alumina, what would hitherto have occupied six months can now be accomplished in a week. The company manufactures a ton in that period, or as much alumi-

num as will yield almost 200 pounds of aluminum."

The Mechanical Properties of Aluminum.

If there is any large amount of fact in the claims above set forth no metallurgical advance has been made equal in value to this since the discovery of the Bessemer process of making steel. The chief commercial value of aluminum consists in its use for tempering alloys. It gives to copper or zinc or tin such properties as are to be obtained by no other means. It seems to soften their nature, while really increasing their strength and hardness. It enables them to resist such tests as are applied to silver and gold, preserves them from corrosion, renders them more ductile, and generally refines them. One consequence of the discovery of the new process of making aluminum will probably be the rejection of all plated goods in favor of articles made of aluminum or bismuth-bronze. Cups, or dishes or spoons made of the latter, have all the appearance of the best plated goods. They do not tarnish or lose their color, and they will wear through without any change in the look of the metal. As for German silver, even the best qualities compare unfavorably with tin which has received a dash of aluminum. It is especially valuable in making bronzes, whether for art or commercial purposes. Its alloys are found especially valuable for piano-forte wires and wires for telegraph purposes. When used for the former purpose, the wires are said to vibrate for ten seconds longer than the wires now in use. It furnishes for such purposes the greatest strength with the least weight, and is almost proof against corrosion. Pure aluminum weighs only one-third as much as iron. It is extremely ductile and elastic. Its elastic range is about three times that of steel, and five times that of wrought-iron. The tensile strength of the pure metal, in proportion to its weight, shows a high mechanical value. It closely resembles silver in appearance, rings like a bell, and can be cut with a knife.

General Machine Works.

The American *Machinist* is of the opinion that the effort on the part of most machine shop proprietors in this country, for the past few years, has been to change from general work to specialties—to convert the machine shop into a manufacturing establishment. In many instances, it looks as if the plan had been too well carried out. Shops that are ready for jobs out of the line of regularly manufactured specialties are, we believe, as a rule, better provided at the present with work than those engaged on specialties. There will always be room for a fair number of good shops, well fitted for taking hold of jobs not in any special line of manufacture. A certain proportion—not a small proportion, either—of machine work is general in its character. Jobs, large and small, are constantly wanted that will never require duplication, and these naturally find their way to shops that are well provided for doing them at reasonable cost without special appliances. Again, there is always being constructed a large amount of experimental machinery, in which important modifications will be made before it passes to the stage of manufacture. The general machine shop should be able to bring this machinery up to the point of manufacture, and then pass it along to those who will arrange for systematic manufacture. Good tools, judiciously selected for this kind of work, and, above all, the best kind of shop management, is required for this. With these the general machine shop is not always the one that is left in the race for business. The ability to handle a variety of general work, so as to get it out well and cheaply, has come to be more of a specialty than the manufacture of any particular line of machinery. There is, in the future, fair prospects for the general machine shop ready to take hold of a job without any red-tape preparation.

A SPLIT NAIL or tack of new form is suggested by R. S. Pickett, of New Haven, Conn. The nail has a head and a shank that is provided with a longitudinal slot extending from the point well up toward the head. In cross section the nail is oblong or oval, the corners being rounded, so that the oblong has rounded ends. The slot is parallel to the rounded edges or sides of the shank. At the point the ends of the prongs are beveled inward on each side toward the slot. Instead of making this bevel plain it may be made concave. The bevel of each prong end is concaved not only transversely, but also longitudinally. This leaves not only a much sharper cutting edge at the extreme point of each prong than a plain bevel would, but also makes sharp edges extending some distance up the sides of the prong ends. The inventor states that prong points of this peculiar shape insure the easiest penetration and also an easy spread of the points, so that they take the firmest hold on the material into which they are driven.

OIL IN BOXES.—There is one thing about journals and boxes that has not been spoken of very much, and that is the circulation of the oil in the box. If the oil circulates throughout the box there is less danger of heating. Good results may be obtained in habbiting boxes, especially solid boxes, by taking paper and placing around the shaft, and then taking stout string and tying around the paper in the form of a quick thread, letting the string go to right and to left.

SCIENTIFIC PROGRESS.

Peculiarities of Lightning.

A correspondent of *Nature* says that in the plains of India at the commencement of the monsoon, storms occur in which the lightning runs like snakes all over the sky at the rate of three or four flashes in a second, and the thunder roars without a break for, frequently, one or two hours at a time. During 12 years' residence in India he had heard of only two human beings and three buildings being struck, although in parts of lower Bengal the population amounts to more than 600 to the square mile. He attributes the scarcity of accidents to the great depth of the stratum of heated air next to the ground, keeping the clouds at such a height that most of the flashes pass from cloud to cloud, and very few reach the earth. The idea is supported by the fact that in the Himalayas, at 6000 feet, objects are frequently struck.

In the British islands thunder storms are said to be more dangerous in winter than in summer, and such a fact, if true, can be explained by the very thin stratum of air then intervening between the clouds and earth.

It is now quite generally conceded that the "return shocks" or "ground strokes"—the electricity passing from the earth to the clouds—are the ones which do the most damage.

L. J. Le Conte, a civil engineer, recently read a paper before the Technical Society of this city, in which he undertook to trace the cause of several recent dynamite explosions in this vicinity to the electricity generated by or accompanying our peculiar desiccating north windstorms. The presence of an abnormal amount of electricity in the atmosphere at such times is shown by the facility with which it may be developed in the clothing of persons when exposed to such winds. Similar phenomena are observed on the hair of horses when at work at such times—particularly on their tails, which sometimes bristle out to twice their usual diameter.

Careful observation and examination have shown that all of the dynamite explosions in the vicinity of San Francisco hay—some eight or ten in number—have occurred during the prevalence of such storms, and when the atmosphere contained a very small amount of humidity.

These explosions are not supposed to result from the direct action of electricity, but from a secondary cause. The electricity causes a "dust explosion," the impact of which fires the dynamite. To further account for the dust explosion, it is stated that the rooms of buildings where dynamite is manufactured are more or less filled with dust from the dry absorbent used in the manufacture, and that this dust is always found saturated with acid nitro glycerine—a condition of that substance very susceptible to even spontaneous combustion, and when so saturated, the slightest spark, such as might be produced by the rubbing of a woollen coat sleeve in a highly electrified atmosphere, might produce a violent explosion. Dust explosions in flour-mills are often caused in such a manner, and so, no doubt, are many, so called, "gas explosions" in coal mines.

It is held that if a certain degree of moisture can be maintained in an atmosphere where dust explosions are likely to occur such danger might be avoided.

Mr. Le Conte thinks that the remarkable electrical phenomena witnessed by parties at Mount McGregor, while preparations were being made for Grant's funeral, were caused by "ground shocks."

Mr. Le Conte further remarks that an impression has long existed in the public mind in regard to lightning, which is hard to eradicate, namely: Most people suppose that all fatal strokes of lightning necessarily come from a thunder cloud overhead, whereas a large percentage comes from the ground.

A stroke of lightning from a cloud has only a local effect at the particular point where it may strike, whereas the return shock, induced by the electrified cloud, may shock the entire country around the point for 20 square miles, more or less, depending on the size of the cloud.

GOVERNMENT AID TO SCIENTIFIC RESEARCH.—In addition to scientific labors of an immediate necessary character, other scientific work is frequently carried on at government expense, which aims at the discovery of truth for its own sake, apart from its direct applications. For examples, the transit of Venus and solar eclipse expeditions may be named, as well as the work carried on by the Bureau of Ethnology. In the latter organization, by government aid, valuable data are saved which would otherwise be lost to science; and this is as it should be. Too often, in our busy, every day life, we forget that there can be no applied science unless there is some pure science to apply; and that the larger problems of science, including much of material value to mankind, are too vast to be grappled by unaided individuals, or even by private corporations. They can be solved only by the combined efforts of many trained experts, working with the best facilities and under systematic direction—a state of affairs which can only be brought about by governmental assistance. When that stops, science languishes; and the growth of every industry, public or private, dependent upon science, is checked. Since every modern government is necessarily in competition with other governments, either in the way of increasing its resources or perfect-

ing its means of defense, it follows that aid to science is one of the factors essential to success; and that that nation which fails in far-sighted intelligence will lag behind in material affairs also. Science, both pure and applied, has become a necessity, upon which the welfare and very life of nations must depend. No nation can fairly expect to receive all the benefits of science while giving nothing in return. Even the narrowest utilitarian must see what vast results sprang from the niggardly public grant which rendered possible the first line of the Morse telegraph.

LAMP SHADES AND THE EYES.—Professor H. L. Cohn describes in *Science* a long series of determinations of the relative values of various forms of lamp shades. The method pursued was to measure the brightness of white paper lying on a table over which the source of artificial light was suspended at a given distance by means of a Weber photometer. As one would anticipate, the general effect of a shade is to increase very greatly the illumination immediately under the light, and not modify it notably at an angular distance greater than 45 degrees from this region. The last section of the pamphlet, which deals with the illumination requisite for easiest use of the eyes, is of the most general interest. Taking as a measure of the value of the illumination in this case the number of lines which can be read from a newspaper in a minute, and as the unit of illumination that of a normal candle at a perpendicular distance of a meter from the paper, he finds that the best illumination is not less than 50 such units. Since even a fifth of this illumination is very rarely secured, except immediately under a lamp provided with a good shade, the author emphasizes the conclusion that few school children work in a satisfactory light.

NITROGENOUS SUBSTANCES.—Herr Stutzer maintains that all vegetables contain three groups of nitrogenous substances: The first represented by asparagine, is soluble water; the second, comprising albumen, is dissolved by the hydrochloric acid pepsin of the stomach, and is distinguished chemically from amides by forming insoluble compounds with copper hydroxide in neutral solutions, and the third is composed of all those nitrogenous substances which are not soluble in water or in acid pepsin. He examined the last group, Commercial cocoonant cake used as fodder by farmers was treated with pepsin and pancreatic extracts, and it was found that the latter in an alkaline solution had somewhat less action on proteins than acid pepsin. Herr Stutzer believes that soda alone is quite as powerful a solvent of nitrogenous principles as when combined with pancreatic ferment.

A LARGE METEOR.—A brilliant meteor recently passed over a portion of Western Pennsylvania, and fell near the West Virginia line. Its location has since been traced, and hundreds of curious people visit it daily. The fallen meteor, which is of immense size, presents the usual characteristics of meteoric iron. A person who saw it during its flight in mid air says: "I never beheld a more awful or impressive scene. My horse suddenly stopped, and I heard a noise as of a mighty rushing wind. Looking up, I saw moving high above me a huge mass resembling a great coal of fire, equal in size to the largest barn I ever saw. There appeared to be attached to it an immense flame of a deep red color, which tapered off into a darker color. The mass gradually assumed a whitish hue, which it retained until it passed out of sight."

TO DETERMINE THE CONDITION OF THE ATMOSPHERE IN CITIES.—Under the slow but continuous action of the sulphurous acid thrown in the air of cities by the combustion of coal and the influence of the frequent changes in the degree of atmospheric humidity, M. G. Witz finds that the peroxide of red lead, used in coloring certain plaacards, is destroyed and sulphated. At the same time the protoxide of lead thus liberated is transformed into an insoluble sulphate. This salt being easily analyzed, a new and certain means is thus obtained for determining the condition of the atmosphere in large cities.

SOLIDS CARRIED BY RIVERS.—One hundred and fifty million tons of matter in solution are annually poured into the Gulf of Mexico by the Mississippi. At this rate one foot of land over the whole basin would be removed in 4000 years. Similar calculations applied to the St. Lawrence, La Plata and the Amazon reach the result that 100 tons per square mile is removed from the entire American continent every year. One cubic mile of earth is deposited every year in the Atlantic Ocean, from America, Africa, Europe and Asia.

SMOKE CONSUMPTION.—Nearly all smoke may be consumed without special apparatus, by attending with a little common sense to a few simple rules. Suppose we have a battery of boilers and "soft coal" is the fuel. Go to the first boiler, shut the damper nearly up, and fire up one-half of the furnace, close the door, open the damper and go to the next boiler and repeat the firing. By this method, nearly, if not quite all the smoke will be consumed.

ETHER VS. CHLOROFORM.—The comparative cases of fatal accidents in the use of these two anesthetics are given as follows: The mortality of chloroform is 1 to 5860; that of ether, 1 to 16,542; that of nitrous oxide, 1 to 100,000,

Growth of American Manufactures.

The birth of manufacturing and mechanical industry in the United States dates from the birth of the republic. During our Colonial existence the repressive policy of the home Government in regard to manufacturing and mechanical industries in the then Colonies, prevented even the inception of any industry whatever, however petty, save that of agriculture alone. The most arbitrary and unjust acts were passed by Parliament, with the view of making England the workshop of America, and America the farmhouse of England.

As a natural consequence, the newly emancipated nation, so soon as it found itself independent of the mother country, and with a rapidly growing population, also found itself cruelly hampered in all the ways of industry outside of agriculture. We had no skilled mechanics and no machinery with which to employ or instruct them. Makeshifts innumerable were resorted to, and native Yankee ingenuity was tasked to its utmost to meet the necessities of the people. England, during the preceding century, had been working under a most stringent protective policy. She was at that time the most determined of all nations against free trade or even "fair trade." She had protected her industries until she had grown rich and overbearing. All nations paid tribute to her, and bought even the most ordinary necessities of life at her factories and her workshops. Her advantages were so great that she was enabled to place enormous profits on her wares.

Possessing such opportunities at the time these States achieved their independence, quite a lively trade immediately sprang up between the two countries, and for the time appeared advantageous to both; so much so to England that the younger Pitt boasted in his place in Parliament that he had re-conquered the American colonies, and that they were worth more to England as commercial dependencies than they had previously been as political dependencies.

But our wise and far seeing statesmen soon began to comprehend the situation and at once arranged for the establishment of manufacturing facilities of our own. In doing so they simply copied the policy under which England had grown wealthy and powerful—that of protection. The first tariff bill was signed by Washington on the seventh of July, 1789, and was most appropriately and solemnly pronounced our second Declaration of Independence—a Declaration of industrial independence.

When England heard and fully understood the meaning and force of this act, she recognized it as a greater blow to her prosperity than our first declaration of political independence. It was then, more than ever before, that the skill and ingenuity of our citizens was put to its metal. Our people at first commenced working with the ill-devised and clumsy machinery which they found then in existence. But the superior skill and cheap labor of England was too much for them, and it soon became evident that it was necessary to meet and overcome those advantages by improved machinery and methods.

Congress once more stepped in to aid our growing industries and supplemented its tariff acts with a provision for the protection of imports, and our system of patent protection was evolved, simple and crude at first; but it was the beginning of what is now acknowledged as the most effective and liberal system of patent laws ever devised. The result was a new departure in manufacturing and mechanical enterprise, by which the cost of production was so reduced by improved machinery and better methods that we were soon not only placed independent of the mother country, but we were even able to come in competition with her, in the markets of the world.

Those necessities and our liberal patent laws have finally made us a nation of inventors—a people that has introduced more valuable inventions than all the world has done hitherto, since mother Eve first invented the fig leaf apron. Yankee invention has, in fact, become proverbial, and is illustrated by the carpet loom, the cotton gin, the lathe for turning irregular shapes, the sewing machine, improvised explosives, interchangeable machines and implements of various kinds, the cable road, the telegraph, the telephone, the audiophone, anæsthetic, and hundreds of other special inventions which might also be enumerated.

As early as 1810 our manufacturing interests had reached a stage sufficient to cause an order by Congress for a special enumeration in the census of that year. The returns, however, were very meager, and produced no results of a very satisfactory nature. The census of 1820 was quite as unsatisfactory, and it was not until 1850, and later, that, by a change of methods in taking the census, really valuable and satisfactory reports have been obtained. Since that time the industrial growth of the country has been something quite marvelous.

By the census of 1850 the number of manufacturing establishments was 123,029. Ten years later they had increased to 140,433. In the next decade the number advanced to 252,148, but between 1870 and 1880 the increase was hardly noticeable, the number in 1880 being 253,940.

A different rate of increase is shown in the amount of capital employed. In 1850 it was \$533,245,351, increasing to \$1,009,855,715 in 1860, and doubling again between 1860 and

1870 to \$2,118,208,769. Between 1870 and 1880 it increased to \$2,790,223,506.

The shops and manufactories gave employment in 1850 to 953,079 toilers who had increased in number by the year 1860 to 1,311,246, and by 1870 to 2,053,996. In the next ten years the increase, as in the other cases, was slow, for in 1880 the workers numbered only 2,738,750, an annual increase for the decade of less than 69,000.

The materials consumed in manufacture were valued in 1880 at \$3,394,340,029. The products increased from \$1,019,109,616 in 1850 to \$5,369,667,706 in 1880.

In the payment of wages, all the States show an increase excepting Nevada, Missouri and Mississippi. Minnesota and Texas doubled their annual payment of wages in the last census decade, and California increased from \$21,000,000 to \$38,000,000.

And now destiny points to this country as the one bound, in the near future, to become the largest manufacturing nation in the world, as we are already the largest producer in point of agricultural products. Our natural resources are almost unlimited both in extent and variety, which, with our accumulating population and the general intelligence of our working people form all the necessary factors for the grand result anticipated.

USEFUL INFORMATION.

WOMEN'S COMPLAINT ABOUT CAR SEATS.—Car-builders and others will take notice that a definite grievance has been presented by the Women's Rights Convention recently in session in New York. About 40 ladies were present, and a complaint made in relation to car seats was unanimously indorsed by all the members of the convention. The complaint was that the seats in cars, both for steam and street railroads, and in ferryboats and other public conveyances, were constructed entirely for the use of men, and were consequently too high for the accommodation of most women. Several ladies present, of whom it is said that they were certainly not below the average height, said that in nine cases out of ten when they took a seat they were unable to put their feet comfortably on the floor, and others said that they were either unable to reach the floor at all or could only do so by stretching the toes, which was unpleasant as well as injurious to health. They could recall no reason why seats should not be made lower, and a memorial asking for reform in this direction was drawn up and signed by all present, and is to be circulated for further signatures. The complaint of the ladies in this respect is certainly justified by the facts, and we think that many men as well as women will admit that the car seats, as now constructed, are certainly higher than there is any necessity of making them. It may also be added that the average car seat is constructed without any reference to the conformation of the human body, the effort of many builders being, apparently, to make the seats as uncomfortable as they can possibly be.

HOW BEES PREDICT THE WEATHER.—No. 17 of *Die Natur* contains an article by Herr Emerig, of Laugingen, on German bees as storm warners. From numerous observations, the writer advances tentatively the theory that, on the approach of thunder storms, bees, otherwise gentle and harmless, become excited and exceedingly irritable, and will at once attack any one, even their usual attendant, approaching their hives. A succession of instances are given in which the barometer and hygrometer foretold a storm, the bees remaining quiet, and no storm occurred; or the instruments gave no intimation of a storm, but the bees for hours before were irritable, and the storm came. He concludes, therefore, that the conduct of bees is a trustworthy indication whether a storm is impending over a certain district or not, and that, whatever the appearances, if bees are still, one need not fear a storm.
